Gov. Rockefeller, having thus undertaken to discredit his opponents, set out on a cross-country tour that was intended to pave the way for grabbing the 1960 Republican Presidential nomination. A disappointingly frigid reception was accorded him. In Los Angeles, he and his wife found it necessary to personally phone their friends to appeal to their vanity and servile cupidity to attend the rigged reception at the Beverly Hilton Hotel. In the Northwest, Oregon and Washington, he was greeted by broadcasts that detailed his malodorous record.

On his return East, Rockefeller was showered with inspired postcards from the patriotic women of the West that challenged his quest for the nomination on the basis of ugly phases of his past activities. He was a bit shocked to find how widely known and how despised was his record. Undoubtedly in the vain hope that attacks on his so vulnerable record would cease, Rockefeller announced, in the following month, on Christmas eve, his pretended withdrawal from the nomination campaign.

As soon as the 1960 Republican Convention was slated to begin, true to expectations based on the Rockefeller tradition of deceit, Gov. Rockefeller emerged on the scene and sought to dictate to the Convention his nomination. He arrived in Chicago with the New York delegation in tow and with four other delegations supposedly pledged to him, on the Thursday preceding the opening of the Convention. He took over for headquarters for himself and the New York delegation, the Sheraton Tower Hotel. He arrogantly demanded the first place on the Republican ticket and announced that he would ac-

cept no other nomination, though none had been offered him. He decreed that his chief opponent, Vice President Nixon, would not win. And he refused to pledge himself to support the Republican ticket if he were not nominated.

The platform on which Rockefeller proposed to run as "Republican" candidate, was identical with those "liberal", "New Deal" and Red, "internationalist" schemes of his that were echoed and rubber-stamped by his Red agents and "yes-men" of his various "committees", or "panels", in the ROCKEFELLER REPORTS. (78) They were the schemes that collaborator Chester Bowles had written into the Democratic platform; and which his minion, Percy, wrote, subsequently, into the Republican platform at the dictates of his boss, Rockefeller. Rockefeller insisted on a plank that demanded a continuation of his so lucrative "foreign (Rockefeller) aid". He demanded an increase in Defense Department expenditures to provide more loot for the Dynasty. In shrieks that reflected his craven terror, as well as his lust for loot, he demanded that billions be provided for the construction of bomb shelters.

Rockefeller's atom bomb and shelter hysteria, which later proved to have a large element of profit for Republican leaders, provided an amusing interlude. His lurid and mad predictions of havoc, of world destruction, that would ensue from "imminent" atom bombing of our country by the conspirators' Soviet partner, were taken seriously by a mid-western religious sect known as Covenant of God. To avert the "imminent" atom bombing and "the end of the world" predicted, they announced their plans to immediately go underground in shelters that they had built and remain there for the following two weeks to avert the destruction of the world that would be caused by the bombing threatened by the candidate. And in a fanfare of publicity, they went underground.

On the Thursday preceding the opening of the Convention, Gov. Rockefeller held a nationally televised press conference in his Chicago headquarters. (Such national coverage is enormously costly to the public and to the Parties, but is a rich source of profit to the conspirators.) None of the press correspondents there present asked Rockefeller the obvious question, that would have been propounded by this author had he been present, to wit:

"Governor, why have you not joined your atom-bomb-terrorized followers, the Covenant of God sect, in their underground shelters?"

On the opening day of the Convention attention of the members of the delegations pledged to Rockefeller was called to his involvement in the so-called "slum clear-

ance and urban redevelopment" land grabs and steals. This was highlighted in the cartoon entitled "BOGUS 'PHILANTHROPIST' LOOTS US" that was widely distributed among four of the five delegations that had been pledged to him, together with a biographic sketch entitled ROCKEFELLER'S QUALIFICATIONS FOR THE PRESIDENCY—OF THE U.S.S.R. At the end of the day's distribution of this data, the delegations were no longer his. It was questionable if he could have been nominated for the post of dog-catcher when the delegates learned of his control of the Public Administration Clearing House ("1313") and its dangerously subversive activities and fostering of public looting by officials organized into a conspiracy against the public. Many of his New York delegation would have liked to desert his ranks, but they feared his vindictiveness, they whispered.

Following the televised press interview, Gov. Rockefeller had invited the press correspondents and the delegates to a "victory ball" that was to be given by him on the following Tuesday at the Sheraton Tower Hotel. By the time Tuesday evening had rolled around, Rockefeller knew that his chance for any sort of personal victory, other than effecting the defeat of the Republican Party, was virtually nil. Numerous press correspondents and delegates showed up at Rockefeller's Sheraton Towers "Victory Ball". A band of the type that tone-deaf Rockefeller favors (that play on the "principle": "The louder the noise, the better the music.") blared away for the dancing crowd.

Gov. Rockefeller failed to make his appearance to greet his guests at the ball. His wife, Mary Todhunter Clark Rockefeller, the "Liberal", and his Harlem-doting son, Rodney, formed the reception line, with toadying, double-crossed California ex-Governor "Goodie" Knight, dancing attendance on them. The greetings extended by them to the Negro guests were especially effusive. Waiters circulated on the periphery of the dance floor and in the adjoining reception room, offering refreshments, both solid and liquid, to the guests who reasonably assumed that they were expressions of Rockefeller's hospitality.

At about midnight, there occurred something that astonished the guests. The waiters began passing out checks for the refreshments that had been served to all of them, including the press correspondents. They were so nonplussed that the correspondents set up a committee to investigate the odd refusal of their Rockefeller host to pay for the hospitality that he had extended to them. According to the dispatches carried on the U.P. wires and pub-

lished on the front page of the World-Telegram and Sun on the following day, they found Gov. Nelson Rockefeller engaged in a heated argument, that lasted for hours, with representatives of the Republican Party. Rockefeller's attitude was reported to be that since he could not have the nomination he had changed his mind about paying for the affair. The report amusingly intimated that he felt that he could not afford it under the circumstances; and "welshed". Abashed, the Republican Campaign Committee, it was reported, effected a settlement with the invited guests. It offered to pay for the scant solid refreshments served, out of campaign funds; but required the guests to pay for their vastly more substantial liquid refreshments. It appears to be a toss-up whether this incident is an illustration of characteristic Rockefeller bogus "philanthropy", their psychopathic miserliness or another demonstration of their "ethics". It fully matched Gov. Rockefeller's fulfilment of his campaign promises and platforms.

During the months prior to the Convention, Gov. Rockefeller had followed his usual custom of insuring the defeat of the Republican Party in event of their failing to give him the Presidential nomination. In his customary spirit of "rule or ruin", he and the Dynasty had viciously attacked President Eisenhower and Vice President Nixon whom he made it clear he would not support in case of nomination. Rockefeller's publicist-biographer, Robert Silverberg, makes his anti-Republican attitude quite clear in his honest but damaging campaign propaganda published as a Monarch Books paperback under the title THE FABULOUS ROCKEFELLERS, in January 1963 and hurriedly withdrawn from the bookstands a few months later. (51) He reports the reaction of Republican leaders in the quotation:

"He is campaigning for the Democrats! He is doing more harm to Nixon than Kennedy could do in a dozen speeches!" (61, p. 140)

This was merely a confirmation of a similar opinion of him that they had expressed on a previous occasion, quoted as follows:

"That Rockefeller! . . . He's nothing but a Socialist in Republican clothing!" (61, p. 121)

Pressagent Silverberg correctly reflected the sentiments expressed freely in the press at the time, in the statement: "Rockefeller . . . was carrying out a Machiavellian scheme to bring himself the 1964 nomination." (61, p. 140)

On the eve of the Convention, Gov. Rockefeller insured the defeat of Nixon (and of the Republican Party)

in the ensuing election by compelling him to make a widely publicized, cringing and humiliating night flight to New York to force him to bow down to his dictates as boss. In his usurped role as bogus Republican political boss that he arrogantly assumed on the basis of treacherously undermining the true Republican Party leaders and of mouth-ing Red, so-called "liberal" propaganda and blasting it nationwide through all the media of mass communication which he and his fellow conspirators control, Rockefeller undertook to publicly dictate to Nixon and the Party the acceptance of the same Communist inspired platform that had been avidly accepted by the Democratic Party in the exact form in which it had been drawn up under the direction of his "New" Deal "soul-mates", including his panelist agent, Chester Bowles. The "Republican" version of this Red platform had been imposed by another panelist Chas. Percy (now seeking Republican nomination for Governorship of Illinois).

Rockefeller's dictation to Nixon and the Republicans meant that he required them to accept as their platform the Red, "internationalist," treasonous plot to subvert our Constitution and Republic; and to repudiate the patriotic, nationalist, American electorate who constitute the majority of true Republicans. Rockefeller's plot served to deprive all true and patriotic Americans of their franchise, of any voice in their Government and of their basic and true civil right to elect a loyal American President. It reduced our country to the one-party system that characterizes all totalitarian governments, including the Communist. And it continued the treachery whereby Nelson Rockefeller and his fellow totalitarian, "New" Deal conspirators have disfranchised a major part of the nation without the use of the familiar poll tax device.

Nixon proved by his "knuckling down" to Rockefeller's subversive dictates and submitting to being his pawn, that he lacked the fighting spirit, courage and patriotism that one expects of a real, true American. He proved himself to be "phoney" and counterfeit, and almighty anxious to worship at the shrine of Mammon in the hope that he might grab a crumb fallen from the Rockefeller altar. He would have won the admiration and vote of every true American, who constitute the great majority of the nation, and would have won the election, if he had defied the conspirators. One wonders, in view of his servile act, if Nixon would have dared expose the Communist activities of Alger Hiss, if he had known of Rockefeller's intimate relationship and domination of Hiss. It seems that

his veneration for money and wealth, no matter how ill-gotten, would have precluded it.

Nixon's running-mate, Henry Cabot Lodge Jr., who is a dedicated "internationalist" or Red, as well as a Rockefeller CFR agent, did his best to insure the defeat of the Republicans; and was rewarded for it by the conspirators with an appointment by Pres. Kennedy as Ambassador to Viet Nam.

Rockefeller is reported to have prepared the coup de grace for servile Nixon and the Republicans, in a deal made with Joseph Kennedy and the Democrats prior to the Democratic Convention. The deal is reported to have provided that the conspirators would throw the Democratic nomination to John F. Kennedy on the condition that he would "lay down" if Rockefeller secured the Republican nomination. But if Rockefeller was not nominated, he would "arrange" the election of Kennedy on condition that Kennedy would become one of his Council on Foreign Relation agents and would permit him to dictate all policy-making appointments on the Cabinet. A Rockefeller secretary has told her friends that Rockefeller has boasted that he voted a straight Democratic ticket in the 1960 election.

These reports derive confirmatory support from the character of the Cabinet appointments made by Pres. Kennedy, directly after the election. Kennedy's appointees were Rockefeller Council on Foreign Relations agents whom Kennedy had never met, and so-called "Republicans". For his Secretary of State, Kennedy chose a person with whom he was totally unacquainted, the President of the Rockefeller Foundation, fellow member of the Council on Foreign Relations and successor of Hiss in the State Department, Dean Rusk.

Rockefeller venom followed Republican Presidential candidate Richard Nixon to the polls. In California, his home State, pressure was brought to bear by powerful Interpublic Inc. and other agencies to compel local newspapers and other media of mass communication to withdraw their support from Nixon, or at least "to damn him with faint praise". False "friendly advice" and pressure was brought to bear on him to agree to participate in ill-advised debates on television that could only serve to publicize and further the interests of his adversary, Sen. John F. Kennedy. Pressure was brought on him to refrain from appealing to the patriotic elements who comprised a large sector of his followers, by vigorous attacks on the Communists and their fellow travellers. Indeed, the position

into which he was forced by the conspirators in his own Party created the impression that he regretted the exposure of Alger Hiss and his fellow conspirators, which had projected him into national limelight; and that he himself had become a fellow traveller.

There was abundant evidence that the election was crudely stolen by all of the traditional crooked devices openly employed on an unprecedentedly vast a scale, together with the newer device of "fixing" the voting machines. The conspirators' Crime Syndicate in Chicago openly boasted that they had stolen the election in Illinois with 200,000 crooked votes. From many sections of the country there came well confirmed reports of crooked voting and stealing of the election, that assured a reversal if investigation and recount had been demanded by the Republican Party and its local officials. Funds had been subscribed by persons in various parts of the country to pay for a recount in Illinois. Its Governor had announced that he would authorize a recount and favored it. But sufficient pressure was brought by the conspirators and their agents to avert undoing their steal and disfranchising of the nation.

The foundation for Nixon's elimination in California, as well as in the nation at large, had been laid when he was used as a messenger boy by the conspirators to eliminate Sen. Knowland and Gov. Knight by inducing them to exchange places on the Republican ticket. As has been related, their defeat won Nixon their enmity and the hatred of their followers. Another factor in their defeat was clearly brought to light after the election. Democratic Governor-Elect Brown announced immediately after his election that he was flying to the East Coast to confer with Gov. Nelson Rockefeller. Was his "mission" to render homage to Rockefeller, that was announced in the Los Angeles Times on the day after election, a deal for payoff for Rockefeller's treacherous support? Undenially Rockefeller could not have been unhappy about driving from the public scene his most dangerous rival for the Presidency. Rockefeller's pal, Alger Hiss, gloated over the revenge on Nixon for exposing his treasonous activities. Was that an element in his boss's attitude?

## CHAPTER XIX

### ROCKEFELLER CAPERS, FOLLIES, RASCALITY & DEPRAVITY

After winning his rigged reelection, Rockefeller became more arrogant than ever in his contempt of public opinion. With the help of his host of pressagents and propagandists whom he had placed on the public payroll, he began to assert himself as self-declared boss of the "tri-partisan" Republicratic "Liberal" (Communist?) Party and national dictator of manners and customs.

Control of all media of mass communication facilitated the process and made it cost-free as well as profitable. Any expenses involved were defrayed by the taxpayers by the simple device of putting campaign managers and numerous personal employees on the public payroll. Even his "indigent" relatives were placed on the payroll in as outrageous display of bald nepotism as American history offers. Campaign expenses were further lightened by "shakedowns" of liquor licensees by the Governor's official staff and by his appointees, as has been recounted.

A constant flow of press releases and interviews airing the "grandiose ideas" of Nelson R(ex) and/or those of his "liberal" or Red "ghostwriters" and "brain trusters" have been fed to the public through newspapers, magazines, radio, television and every other utilizable device. Seldom has a day passed that one or more of his "quaint" notions accompanied by photographs of his grimaces (that express either his lack of emotional control or else the "emoting" that he has been taught by his trainer, the TV producer "Pat" Sylvester Weaver) has not hit the headlines to nauseate and disgust the public. Several incidents in the personal, but not-so-private lives of the Rockefellers have supplied crescendo passages to the Rockefeller propaganda and publicity.

The odd marriage of Winthrop Rockefeller to divorcee "Bobo" Sears provided a heart-throb for feminine America that was exploited to the utmost by the Rockefeller pressagents. But little of the true but strange aspects of the story was released by them. Nothing was mentioned

about some interesting phases of her residence in an apartment loaned her by her divorced ex-husband, on Third Avenue, New York, under the noisy El. Nor was anything said about some even stranger aspects of the habits of Winthrop that were intimated in Polly Adler's book, **A HOUSE IS NOT A HOME** and baldly stated by Lyle Stuart in his book, **THE SECRET LIFE OF WALTER WINCHELL**. (85, p. 230) It was presented by their press-agents as a "pure romance" of a modern "Cinderella".

The pressagents truly represented that the Rockefellers were delighted to learn of his interest in a woman, despite Bobo's background. And they urged him to follow her to Florida in the family plane, when she fled to the peculiar refuge of a cafe "society" friend's home. The press reported that in the course of this pursuit, the plane was momentarily grounded. But the wedding took place promptly on his arrival.

Various rumors made the rounds regarding the reason for the separation of Bobo and Winthrop. Some attributed it to Winthrop's "homophile" nature. (85, p. 230) Others reported that the "nigger in the woodpile" was Bobo's insistence on going to mass and confession during her pregnancy, which did not please the Baptist Rockefellers. The couple separated. Bobo returned to her parental farm in Indiana with her child and little else other than some jewelry, a victim of Rockefeller penuriousness. For a time she was able to provide for herself and her child by disposal of some of her possessions. But in due time, she arrived at the end of her means. An endless series of legal skirmishes involving an army of attorneys signalized the effort of Bobo to get her trillionaire, "philanthropist" husband, Winthrop Rockefeller, to provide for their child.

Bobo was driven to seize the Park Avenue apartment in which Winthrop lived, which he had provided her as their home, and which was rightly her own, in a desperate attempt to force him to provide for her and their child. But she lacked the means to hold out and provide for their child, Winthrop Jr. At this juncture, she was advised to call a press conference in the apartment and relate some of the plans that she had heard the Rockefeller brother discuss in their Sunday conferences. In particular she related that Nelson Rockefeller proposed to "make himself President without being elected". The story was carried by the Saturday magazine section of the conspirators' New York Post.

Immediately after the appearance of the story, Bobo is reported to have received urgent phone calls from Rockefeller attorneys offering her a settlement for herself and

her son of more than six million dollars. Only one stipulation was required of her. She was required to agree that she would never open her mouth again with regard to Rockefeller affairs, on the penalty of forfeiting the entire settlement. She then surrendered the apartment with its pornographic collection that was reported to be the world's largest, and obtained a divorce.

The marriage of Gov. Rockefeller's son, Steven, to their former Norwegian servant, Anne Marie Rasmussen, with what was reported to be the grudging consent of his parents, was intensively exploited by his pressagents and campaign manager, as another "Cinderella" affair. Steven, the "apple of Nelson's eye" had distinguished himself as a Princeton University student by displaying the familial bigotry and intolerance. As chairman of the inter-dining club committee, Steven Rockefeller had decreed that Jewish students should be barred from the clubs. This revived anti-Semitism that for decades had been absent from the campus. The Jewish students who protested, he is reported to have advised that they could leave the university if they did not like his ruling.

Shortly thereafter, Steven proved his loyalty to the Dynasty's tradition of Red "liberalism" by inviting his father's pal and "fall guy", jailbird Alger Hiss, to come to Princeton and address the "American" Whig Cleosophical Society. This invitation was extended about the time that Hiss was released from the Lewisburg Penitentiary where he had been incarcerated after conviction for perjury in connection with the treasonous, wartime delivery of information to the Communists. Princeton alumni throughout the country were shocked by this act of disloyalty. They drew up petitions which they sought to post on the bulletin boards of Princeton clubs around the country. They were barred from so doing by order of the University's Board of Trustees, that was headed by Steven's uncle, John D. the Third.

Father Halton, the university's Catholic chaplain who was attached to the Thomas Aquinas Foundation that was dedicated to work among the students, protested the invitation extended by Steven Rockefeller to Alger Hiss, as a subversive and disloyal act that could only serve to foster treason among the students. Pressure was brought to bear on the President of the University to oust Father Halton. He refused and was ousted by retirement. His successor complacently ousted the chaplain. Fr. Halton received the support of his bishop, and he was free to express his sentiments in the matter. That highly displeased the conspirators. Pressure was brought by them on the Vatican

to have Fr. Halton silenced. In due time, orders arrived from Rome through the Papal Legate that resulted in the withdrawal of the bishop's support, and silenced and transferred Fr. Halton. For these "distinguished activities", Steven Rockefeller was honored by Princeton when he graduated.

Steven, reflecting the Dynasty's attitude toward patriotism, did not join the Reserve Officers' Training Corps at Princeton. Subject to the Universal Military Training Act that was decreed for all American subjects of the Rockefeller Empire, Steven was not able to follow his father's example in completely dodging the draft. He did, however, evade the full two year term of military service that was required of other draftees by taking advantage of a regulation that permitted those engaged in vital defense industry tasks to serve on active duty for a six month period and enter the active reserve for a period of years—provided that they return to the defense industry. At the time that Steven Rockefeller was allowed this dodge, he was not known to be engaged in a defense industry. Furthermore, the Armed Services had suspended this rule and had shut down on the six month service period and required a full term of service of two years, for the rank and file draftee.

Following his discharge from the service, it proved that the "vital defense industry" in which Steven Rockefeller occupied himself was campaigning with his father for his reelection; and marrying his Norwegian maid and breeding. Subsequently he entered the Union Theological Seminary, in order to determine if he was interested in preparing for the clergy. It remains to be seen to what exalted swivel-chair "military" post he will follow his father when the Dynasty has engineered its next war, on the basis of his "distinguished military service".

Rockefeller and his press agents capitalized heavily on this "personal affair" in his campaign buildup. It was stressed that the intimacies of Steven and Anne Marie had actually begun in the sacrosanct shrine, the Rockefeller home, and at Princeton; and that Anne Marie had been a lowly servant in the home of the Rockefeller "Fairy Prince," who had been condescendingly elevated, in Cinderella-like fashion, to the rank of Princess. It was intensively publicized as an international cause celebre; and pointed out that the groom's father, Nelson, was on the doorstep of the White House and about to enter it as the next President of the U. S.!

The next cause celebre of Rockefeller's that was intensively exploited by his pressagents, with no injury to his

political schemes, was the death of his son, Michael, in Dutch New Guinea. The background of this tragi-comedy was the traditional Rockefeller training of their offspring, which requires that they must manifest the traditional familial psychopathic character before they are admitted into its inner circle and given a voice in the administration and disposition of its pelf. Michael deviated from what has been the "normal" in the Dynasty. He showed what appeared to be an interest in science, in anthropology, instead of mere psychopathic greed. And this, evidently, was cause for alarm. Michael Rockefeller found that he had to prove that his scientific interest could yield a high rate of "profit", or loot. This he undertook to do by staging a cheap and ill-equipped expedition to primitive Dutch New Guinea for the purpose of following the Rockefeller tradition of inducing others to carry out criminal activities that would yield the Dynasty a profit, loot. Michael's specific purpose was to induce the natives to murder one another to supply him with fresh specimens of a form of "primitive art" that is so dear to Rockefeller, shrunken heads.

Michael's objective was to sell the heads to his father for exhibition in his so-called "Museum of Primitive Art". The "Museum," housed in a former Rockefeller home at 15 W. 54 Street, New York, serves for tax evasion on property that is being assembled for an extension of Rockefeller Center. Housed in the basement, the exhibits consist of several dozen borrowed, crude, aboriginal items. For viewing them, Rockefeller "philanthropically" charges fifty cents admission; and for a skimpy two-penny "catalogue", one dollar. Business had not been very good at the "Museum". Michael's objective appears to have been multiple. His exploit in securing the heads could be intensively publicized, greatly enhancing their lure. His father, Nelson, could then afford to pay him a relatively high price for them out of the profits derived from exhibition in his "Museum". Thus Michael might have won his spurs by proving that there is adequate loot in anthropology.

Michael Rockefeller offered the savage, scantily "civilized" natives (who had only recently been weaned from their headhunting and cannibalism by the local Dutch administrator by the threat of execution for murder) ten times the price for freshly shrunk heads that had prevailed before outlawing by the Dutch. He offered the "enormous" price of ten axeheads, equivalent to thirty admissions to the "Museum". The Associated Press reported that the natives had naively appealed to the Dutch officials for permission to resume headhunting murders

to enable them to earn the "huge price" offered by Rockefeller.

It is poetic justice that Michael Rockefeller probably turned out to be the victim of the crime that he had plotted. It was an unusual denouement in the annals of Rockefeller crime! The plotter became the victim of the crime that he had planned. This may be a hopeful sign. Another unusual feature of the crime was the fact that a Rockefeller risked his own life in its execution, for the first time in the annals of the Dynasty, after millions of lives had been destroyed in a seemingly endless series of wars in its service.

Nelson Rockefeller's gesture of a rescue flight to Dutch New Guinea served to secure himself unlimited front-page, melodramatic publicity for his forthcoming campaign for reelection to New York's Governorship. In the meantime there had developed a contretemps—the announcement of the separation of the Rockefellers and their plans for divorce.

While Gov. Rockefeller was in New Guinea with his daughter, Mary Strawbridge, Michael's twin, his wife, Mary Todhunter Clark Rockefeller gave the cited interview that was published in the November 19, 1961 issue of their New York Journal-American. In polite language, she voiced the sentiments of the family that Gov. Rockefeller is non compos mentis, delusional, paranoically penurious and aberrant in his relations with his employees. The full significance of the latter charge was not appreciated by most of the readers until after his reelection, when he hurriedly married the wife of a Rockefeller employee, Dr. Murphy, who worked for them at the Rockefeller Institute, directly after she had divorced her husband and yielded to him the custody of her four children.

To overcome the revulsion of public opinion regarding his marital infidelity and to insure his reelection, Rockefeller was again aided by his agents in the Democratic Party. Led by a group of so-called "liberals", or Reds, who were members of the Rockefeller Council on Foreign Relations, in that Party, headed by ex-Governor Lehman, and joined by Eleanor Roosevelt, the conspirators staged a ruinous split in its ranks. The pretext for the split was represented to the public as being, amusingly enough, "bossism" by Tammany leader, Carmine DeSapio, whose real bosses were Rockefellers and their agents. The conspirators nominated as their gubernatorial candidate an absolutely unknown Jewish District Attorney Morgenthau who they were certain would go down to defeat. Much

to the astonishment of the conspirators, despite their manipulation of the Rockefeller-controlled election machinery, Rockefeller fared rather poorly in his campaign against the unknown Morgenthau. In contrast with the low campaign chest of the Democratic Party that ordinarily receives rich support from Rockefeller and their agents, Gov. Rockefeller drew heavily on all agencies and individuals dependent on the State, and also more or less indirectly on the taxpayers who were levied on for the payment for patronage.

Like Rockefeller's Administration, the election was the costliest and most corrupt in the corruption-rife annals of New York State. While drawing on the citizenry for funds to pay for endless radio and television broadcasts and rigged "interviews", which netted his agencies and himself fat profits, Gov. Rockefeller wooed the electorate with his usual made-to-be-broken campaign platform and pledges. He did tone down his yelping for bomb shelters. No doubt this was because of the still fresh exposures revealing that his henchmen, including Assembly Speaker Joseph Carlino, had been malodorously involved in a conflict of interest in the promotion of glass fibre bomb shelters by Lance Inc., a company of which he was director.

He assiduously wooed the Negro and Porto Rican vote with the issues of desegregation and unlimited welfare and relief subsidy. The latter, he charmed in Harlem with speeches delivered in Spanish. His campaign, like his Administration, followed every curve of the Communist Party Line especially in his dedication to "internationalism". And he pledged that he would not repeat the tax gouge which he had imposed directly after his first election and which had driven numerous industries out of the State and greatly intensified unemployment. He pontificated on national and international issues in a manner that made it obvious that he was campaigning for the Presidency rather than for the Governorship. And he refused to pledge that he would remain in office for the entire term of four years and not set his course for the White House.

Directly after his reelection, Gov. Rockefeller revealed his basic dishonesty and deceit. He sharply increased taxes levied on all vocations and industries in the guise of increases in permit and license fees; and also a variety of nuisance taxes. And he introduced changes in the administration of the State's income tax law including advancing the dates of payments. He levied on the State the highest tax bill and budget in its history. He indulged in his practise of setting up "commissions" to echo his dictates and

for the purpose of placing his private employees and his kinsmen on the public payroll. When confronted with his dishonest and callous flaunting of his campaign pledge on taxation, Rockefeller brazenly tossed off the remonstrances with the shifty, hypocritic pretense that the huge increase in fees "is not an increase in taxes". With the clear-cut objective of bankrupting the State, he at the same time vigorously opposed the reduction of the tremendous cost of welfare and relief expenditures by the imposition of a residency requirement for granting of relief to prevent migration into the State of shiftless persons for the sole purpose of collecting relief payments. And he again ignored the challenge to end the evasion of taxation by himself, by his family and by their bogus "foundations".

Comptroller Levitt protested the tax increases imposed by Gov. Rockefeller as unneeded, provided that the rate of expenditures by the State were not increased. Rockefeller characterized Levitt's statement as false. He alleged his objective was "fiscal integrity", a "pay-as-you-go basis".

In the following year, Rockefeller's Republican henchmen joined Levitt in denouncing his "fiscal integrity" as "fiscal fraud". The full extent of Rockefeller's juggling of the State's finances and his thorough deceit and dishonesty came to light with exposure of a huge increase in expenditures in the extension of patronage and numerous crooked devices for covering up a huge deficit, in spite of the fact that the budget had been increased by more than 50%, to almost three billion dollars. Republican State legislators joined their Democratic foes in denouncing Rockefeller's budget as dishonest and full of "pork barrel" and loot. On February 13, 1964, at the very time that Rockefeller was in New Hampshire campaigning in the Presidential primary and lying about his "fiscal integrity", Republican Assemblyman Edwyn E. Mason denounced Rockefeller and his dishonest juggling of the budget and predicted, as a result, huge deficits in ensuing years that would necessitate doubling the budget in the near future. (130; 131) Eugene H. Nickerson made the uncontradicted statement:

"There has been the most elaborate and complicated machinations by the Governor to obscure this fact . . ." (130)

The full measure of Rockefeller's fiscal frauds came to light in September, 1963, when Rockefeller and his henchmen proposed the sale and rent-back of State office buildings to help cover up the huge deficit and the lie that he was running the State on a "pay-as-you-go" basis. It

was frankly acknowledged that the future cost of renting back the buildings would greatly increase the cost of the space to the State and further increase the deficit. It was not revealed whether Rockefeller and his Dynasty proposed to purchase the buildings and their valuable sites, and to gouge the State in future rentals. Other crooked devices that are Rockefeller favorites, such as the multitude of publicly financed private "authorities" and costly bond issues yielding high rates of interest to the conspirators and completely tax-exempt, were not dilated upon at the hearing. Nickerson stated:

... while the Governor contends that he is on a "pay-as-you-go" basis, he is borrowing in an intricate way designed to hide the true effect from view.

"We might be tempted to ignore this as a harmless piece of chicanery, more revealing of the Governor's character than hurtful to the public, if it were not for the fact that the public is paying such a steep price for this kind of thing."

Comptroller Levitt has reported that Rockefeller's fraudulent pretense of "pay-as-you-go" and fiscal integrity will cost the taxpayers more than \$171,000,000.00 in interest on the deferred obligations alone. This sum will flow largely into the purses of the conspirators, who place these prize, tax-exempt securities in their portfolios. This public looting and fraud are the Rockefeller concept of "fiscal integrity"!

With his reelection won by duping of his "peasant" electorate with false propaganda and other dishonest devices, Gov. Rockefeller proceeded to prove that he is "a chip off the old block". He set an example in ethics and morality for the nation in following in the footsteps of his criminally psychopathic forebear, bigamist "Doc" Bill Rockefeller. For several years there were rumors of an affaire with Margaretta ("Happy") Fitler Murphy, the wife of a Rockefeller employee, Dr. Robin Murphy, which were highly reminiscent of John D's treatment of his help. These rumors were confirmed when she abandoned her husband and four infants and secured a "quickie" divorce in Idaho. Shortly after her divorce, Gov. Rockefeller hurriedly married her in May, 1963.

In an article in the Rockefeller-controlled Saturday Evening Post issue of June 22, 1963 (86, pp. 15-9) written by Joe David Brown, entitled THE GOVERNOR'S HAPPY LADY appear some revealing, intimate data regarding Rockefeller's new bride, "Happy". She is described as "sloppy", "dirty" and slovenly. It relates that a mother of three infants, she left her husband and children

to join Rockefeller and be at his side in his political campaigning. After his election, she remained at his side through 1959, in New York and Albany. Early in 1960, she left Rockefeller's side to return to her home to be delivered of her fourth child, her third daughter, Malinda. After the birth of the child, she returned to the side of Gov. Rockefeller, where she remained until she left to secure her Idaho divorce.

Highly suggestive of the true situation is Brown's opinion that the three year old Malinda would live with Rockefeller and his "Happy", whereas the other three children would remain in custody with "their father", Dr. Murphy. Subsequent press releases revealed that Dr. Murphy refused to surrender the custody of the children that he had been given. (132)

The detestation in which Nelson has been held by many of the members of his family because of his aggressively domineering attitudes and other personal traits, of which they have freely complained to any listener, including their merchants, was reflected in the shunning of his second marriage ceremony and reception by many of them. Desmond, Rockefeller's latest pressagent and campaign biographer discreetly reports that the May 4, 1963 wedding took place in the home of his brother Laurance, at the family estate at Pocantico Hills; but was attended by only one of his sons, Rodman, and his wife and his step-mother. John D. the Third, he pointedly notes, spent the day in Virginia entertaining the first Mrs. Rockefeller. (133, p. 317)

The Rockefeller newlyweds, Desmond relates, flew to Caracas, Venezuela, in a commercial plane on their way to his duchy, the inaccessible Monte Sacro, in the Chirgua Valley. (133, p. 317) But Desmond carefully refrained from mentioning a number of notable facts in connection with the honeymoon, including:

1. Gov. Rockefeller, in the true tradition of royal honeymoons, was accompanied by State Trooper Captain Galvin, under orders, and by two of his personal security officers. This belied Rockefeller's false representation that the wedding was his personal private affair and of no concern to the press or to the electorate. New York's taxpayers were deprived of the services of their public officers, but had to pay their wages during this "private affair". This is but another instance of Rockefeller's impressing officials on the public payroll to serve him privately.

2. Rockefeller, with his bride, in the capacity of Venezuelan overlord, received a royal reception in Venezuela

that contrasted sharply with that which had been prepared for and accorded to Vice President Nixon and his wife. (87, p. 24: 2)

There was the "coziness" suggestive of aboriginal Mormonism in the housing arrangement made by Rockefeller for his new family. He moved in with his new wife into an apartment at 810 Fifth Avenue, a floor below that occupied by his first wife. Even ultra-tolerant New York cafe "Society" lifted an eyebrow at this new arrangement. It was, no doubt dictated by Rockefeller's parsimony-inspired "tight control of household expenditures" about which his first wife complained.

The situation is a striking demonstration of Rockefellers' adherence to family "tradition" in these matters. His action was a hereditary throwback to his great-grandfather, quack patent medicine vendor, horse thief, swindler, bigamist, rapist and "good mixer", "Doc" Bill, the psychopathic criminal founder of the Dynasty. "Doc" Bill, it is reported, as noted, brought his newly-wed (bigamous?) wife, Elizabeth Davison, the mother of John D. to live in the same home with his mistress and the two children he had had by her. This appears to be one of the "superior" proud traditions of the Rockefellers.

On their return from their "royal" Venezuelan honeymoon, Gov. Rockefeller trotted out his "Happy" on every possible occasion, with the puerile enthusiasm of a youngster showing off a new mount in the spirit of "Love me, love my hore". In an equally juvenile spirit, Rockefeller omitted from his biography in the official New York State Directory, any mention of his first wife and his six children by her. But not many months later there emerged evidences that his enthusiasm for "Happy" had waned. Mention of the omitted first wife and family were restored in the Directory.

Of even greater import were the "inspired" lines in the above-quoted article by Brown in the Saturday Evening Post (71, p. 18) describing "Happy" as a sloppy female who puts her clothes away folded but dirty and whose house looks "as if it came out of a second hand store". The irritation that it must cause her "lover boy", Nelson, can be surmised from the fact that he is so meticulous that if he fancies that one of his crazy paintings hangs on the wall a degree off angle, he arises in the middle of the night to adjust it. Since Rockefeller interests control the Post, it looks as if the article were designed as public reprimand. And it created the impression that the "lover-boy" was shedding his rosy glasses.

Whatever the intimate situation may be, Gov. Rocke-

feller has plumbed new depths of contemptibility in politically exploiting his wife's, "Happy's", pregnancy. This innovation that signalized a new low in American political campaigning, and a new high in Rockefeller's shabby crudeness, cheapness and poor taste, followed up his announcement that "Happy" was "expecting". It was an execrable bit of pressagentry. On the first page of the N. Y. Daily News of January 1, 1964, there was published a portrait of Gov. Rockefeller posing with an infant in his arms and pregnant "Happy" standing at his side. A "streamer" headline above the picture quotes Rockefeller as remarking: "It's good to hold a baby". On page 3 of the newspaper there appeared a follow-up story of the publicity stunt that was in equally poor taste. The Rockefeller of this disgusting bit of poor taste is the fellow whose pet phobia is OTHER PEOPLE'S BABIES, whom he and his propagandists label "THE POPULATION EXPLOSION". They have inspired newspaper headlines such as the one that appeared in the magazine section of a Saturday issue of the N. Y. World-Telegram & Sun a number of years ago with the headline: "BABIES MORE DANGEROUS THAN ATOM BOMBS".

Though Rockefeller promulgates the view that other people's babies are a menace to the world and peace, and has launched through the Dynasty's foundations numerous birth control movements and measures, he does not hold the same view regarding the products of his own fruitfulness. The situation leads one to wonder. Does Rockefeller think that the pleasures of breeding and of holding infants are to be reserved for himself? If this is true, it would not be the first time that this psychopathy has played a role on the American scene.

John Humphrey Noyes, founder of the Oneida (theistic Communist) Colony held the same view regarding himself and put it into practise in his Colony. Like the leaders of the thousand or more Christian Communist colonies that thrived in the U.S.A. during the 19th century crackpot era, Humphrey Noyes declared himself to be a "reincarnation of Jesus Christ". He was accepted as such by the followers who flocked much as the current generation flocked about the "Beatles", to join his colony, and worship him. Noyes, as Christ's reincarnation, ordered that all married couples must separate and have no relations with one another. The women and girls were confined in one house and the men and boys in another. Only Noyes himself, as "reincarnated Jesus Christ", and a few select "disciples" could have any relations with the women. For, he represented, in his cunning psychopathy, that as the

Lord, it was his duty to "improve the human race". (2, pp. 361-409) In his book HISTORY OF AMERICAN SOCIALISMS, Noyes undertook to "justify" this scheme. (134) One wonders if it can be expected that "population explosion" foe, Rockefeller, will advance such plan for birth control, as one of his "grandiose ideas"?

While Gov. Rockefeller was adjusting his marital life to his complete satisfaction for the nonce, he insistently dictated to the press and to the public that his ethical and moral conduct were of no concern to them. Despite the costs of his courtship and honeymoon which he had imposed on the taxpayers, he insisted that it be set apart from his political life. It remains to be seen what are the sentiments of the public on this score, if they can manage to express them at the polls without abridgement or deprivation of their franchise.

Under the guidance and direction of his "liberal", Red "brain trusters", Rockefeller arrogantly undertook to dictate to the Republican Party the adoption of his Red New Dealism as its tenets, and in the words of his publicity agent Silverberg, "to change not his affiliation but the philosophy of his party . . . transforming the Republicans . . ." (61, p. 109). In so doing, as has been related, he did not disdain to flagrantly violate the laws of the land. Press dispatches reported that an unsuspecting employee of the Internal Revenue Department had undertaken to treat Rockefeller in the same manner as any other taxpayer. But he soon discovered his error! A columnist reported the incident in more detail than did the brief dispatch. He related that Gov. Rockefeller had been caught using the tax-exempt funds of the Rockefeller Foundation in clear-cut and flagrant, criminal, violation of the law, for his political activities, his quest for the Presidency, in 1960.

It is difficult to understand why the Internal Revenue Service that so hounds the little fellow who has deducted a ten dollar expense item of which they disapprove, has failed to discern that the funds of the entire Rockefeller Foundation Trust are used almost in their entirety for political activities and for the influencing of legislation in the Dynasty's interest, in flagrant violation of the law. The law requires that such violations shall be penalized not only by forcing the foundations to pay the taxes that would have been levied in the absence of tax-exemption during the entire period of its existence, with enormous and virtually confiscatory penalties, but also requires that the existence of the foundation with its tax-exemption be terminated, and that the parties involved in these crimes

shall be criminally prosecuted with as much vigor as is any other organization or citizen, with penalties that include both fines and jail sentences.

The columnist acknowledged that the Rockefeller Foundation faced "real trouble". But, he related, Rockefeller and the Foundation were, neither of them, penalized with a confiscatory penalty and jail sentence, as are the rank and file of Federal income tax evaders. The Internal Revenue Service apparently adheres to the doctrine, with regard to the Rockefellers, that "the King can do no wrong". Rockefeller was let off "scot-free" on his promise that he would not be caught at it again. And we "peasants" still continue to enjoy the privilege of paying for them the taxes that the Rockefeller "philanthropists" do not pay, and which they probably would evade paying even if they were required to do so.

Equally criminal, still not thoroughly investigated and untouched by the sleuths of the Internal Revenue Service, was the fund raising by shakedown of retail liquor licensees by the official family and intimates of Gov. Rockefeller, to which reference has been made. It served to make clear, however, the reason for the failure of New York State Attorney General Louis Lefkowitz to investigate and prosecute the Governor's violation of the State's Corrupt Practise Act which were recounted in the cited petition. It was brought to light in the course of the liquor dealers' shakedown investigation that Lefkowitz, his law firm and his successor were heavily engaged in the liquor license business. It brings to mind the old adage: "People who live in glass houses should not throw stones".

## CHAPTER XX

ROCKEFELLER PROMISES IF ELECTED:  
ERADICATION OF "VICE" OF PATRIOTISM.  
RED "INTERNATIONALISM"—AS "FEDERALISM."  
DOMESTIC & "FOREIGN AID" LOOTING  
FOREVER.

What sort of a government does campaigning Rockefeller offer us if he makes himself President? There need be no doubt about this. For Rockefeller has made it ultra-clear what he proposes to do with us, with our Republic

and with the Constitution on which it is based, if he becomes President. He has done so in numerous speeches, in the "reports" issued by committees that he has set up to echo his schemes, and in articles and a book that have been ghostwritten for him and published in his name.

The most recent Rockefeller publication bearing on the topic is **THE FUTURE OF FEDERALISM**, which is, in effect, his ghosted version of "MEIN KAMPF". An analysis of its contents will be presented later in this chapter. Let us first consider the outstanding motive behind the scheme, Rockefeller's basic, psychopathic motivation: fear of poverty and quest for absolute security, giving rise to the desire for "making money", which he and his truthful pressagents and biographers clearly state on his behalf. This is the motivation that is at the root of his "internationalism" and his insistence on its corollary "foreign aid". For both of them mean to him "making money" on the grandest conceivable, on a worldwide, scale by conquest and plunder. And "internationalism" is the antithesis of honest patriotism.

Intelligent love of one's country, patriotism, bars the way to world dictatorship and looting. Hiss's exposure made Nixon the idol of deluded patriots and feared by the "internationalist" conspirators. The conspirators accomplished Nixon's defeat in his home State, and that of the Republican Party in the nation. This defeat served to highlight the meagre victory of Rockefeller's that his pressagents touted as indicating the "necessity" of his being given the Republican Party's Presidential nomination in 1964. Such reward is "fitting" for the treachery involved in betraying the Party from within.

In order to make sure that Nixon's Presidential prospects and ambitions would not recover from the blow of his defeat in the California gubernatorial election, the conspirators arranged through Rockefeller agent, James Haggerty, for a television broadcast of obsequies for the political career of Nixon, over which Rockefeller associate and "fall guy", jailbird Alger Hiss presided. And later, to further guarantee that Nixon would play no significant role in the 1964 Republican convention, he was lured by what was represented as a fabulous financial offer, a partnership in one of the Dynasty's legal firms, to leave California which was the root of any political influence that he might still possess, to move to New York. In New York, he was mockingly welcomed by Gov. Nelson Rockefeller, the architect of his downfall, and provided with a costly cooperative apartment in the same Fifth Ave. building occupied by the Governor and his wives. There, after a trip to Europe, he publicly an-

nounced at the end of September, 1963, his advocacy of the candidacy of Rockefeller for the Republican Presidential nomination. Nixon, in effect fawned and grovelled at the hand that slapped him down.

In the meanwhile, there appeared on the political scene a development that greatly alarmed Gov. Nelson Rockefeller and his fellow "liberal" conspirators. There has arisen a resurgence of the spirit of American patriotism that the Rockefellers and their fellow "liberals" and subversives thought they had destroyed by the campaign that they had persistently directed against the "vice" of patriotism that they identified with what they called "the folly of isolationism" and "McCarthyism". This threatens a dangerous setback and even defeat of their purpose of extending the Rockefeller Empire around the world and the universe, and of expanding the dominion of their Soviet partners and agents.

Rockefeller determinedly set about destroying the "menace" of patriotism. He rails at American patriots as "the lunatic fringe", "the radicals of the far right", whom he describes as "a greater menace than the radical left". Quite naturally, Gov. Rockefeller directs his fume and fury against the potential Presidential candidate who is the darling of the element who prefer to label themselves as "Conservatives" rather than as "American patriots". For as often as not, the first loyalty of themselves and their movements is to a religious denomination or sect and not to our country, our Republic and our Constitution. They subversively spurn the Constitution as their sole faith, as it was accepted by the sincere founders of our Republic. Instead, their faith lies in the very religions and denominations that the signers of the Declaration of Independence did, of necessity, repudiate. For the latter rejected and revolted against the concept of rulers "by divine right" which is the fundamental basis of all religions.

Rockefeller's attacks and ravings have been directed against Sen. Barry Goldwater, who has emerged as the "white hope" of the elements opposed to his Red, Illuminist-Marxist so-called "liberalism" that serves as a cloak for the thievish, totalitarian objectives of the conspirators. These attacks of Rockefeller's are being made in a "rule or ruin" spirit that is characteristic of him. To split the Republican Party wide open and insure its defeat unless he be given its nomination and, in the words of his publicity agent Silverberg, to "transform . . . the Republicans" into an agency of subversion and treason, is Rockefeller's overt purpose.

In a primary campaign speech, made at Concord, New Hampshire on January 4, 1964 and reported in a special dispatch to the N. Y. Times of the following day, Rockefeller laid bare the keystone of the conspiracy, which is the heart of his "internationalist" platform. (125, p. 47:1) He challenged Sen. Goldwater to answer the following questions:

"How are we going to preserve the solvency of this great DEMOCRACY (he never refers to our country as a Republic) of ours with fiscal integrity (bear in mind that he refers to the fraud perpetrated in New York in these words) and at the same time abolish the progressive income tax (imposed on us by his grandfather and namesake, Sen. Nelson Aldrich and exempting them from taxation)?

"How are we going to preserve the security of America if we abolish the major source of revenue, which is the source of support for our national defense (alias, for war industries which Rockefellers control, and are an important device for their looting of the nation)?

"How are we going to preserve security (of the Rockefeller Empire and its Soviet Axis partner) if we withdraw from the United Nations (a device which he created with the collaboration of Alger Hiss for the purpose that it has served so well: to block any opposition to the spread of Communism around the world for looting by the Rockefeller-Soviet Axis)?

"How are we going to preserve security (for the Rockefeller-Soviet Axis) and stability (that it has made nonexistent except for themselves) in the world if we cut off foreign (Rockefeller) aid (thievery)?" The phrases in parentheses express the truth, which Rockefeller carefully omitted. They constitute the best and most obvious answers to his false pleas, that were uttered with the purpose of dividing the Republican Party by inveigling Sen. Goldwater into the same type of rigged debate that the conspirators had foisted on Nixon to bring about his defeat. Rockefeller's shameless hypocrisy in this matter is made much too clear by his refusal to debate his opponent, Morgenthau, in the New York gubernatorial race, because of the certainty that he and his sham and hypocrisy would have been exposed much too clearly with a bit of truth.

Rockefeller craftily relies upon Sen. Goldwater's loyalty to the Republican Party and his patriotism not to expose the ugly truth and not to jeopardize our national security by truthfully answering Rockefeller with the above-noted facts with a wealth of supporting data. This author re-

gards Goldwater's attitude as erroneous in both respects. And he will here answer Rockefeller's hypocritic questions, because they fully reveal Rockefeller's intent to intensify the betrayal of our country and its security. He also feels it incumbent to answer, because the censorship maintained by the conspirators, which distorts and falsifies the statements of the opposition, and presents their own leader's activities, no matter how nefarious, in a favorable light.

Nelson Rockefeller's "Chicken War" is a case in point. This affair came to a climax at the very time that Rockefeller launched his campaign for the Republican nomination, in October, 1963. Our farmers and poultrymen found that their chickens were excluded from the EEC market where they had previously sold more than forty million dollars of their production, by a tariff that discriminates against them. They were seriously hurt financially, both by the reduction of their sales by the exclusion and by the effect of the resultant overproduction on their domestic market. Rockefeller never fails to make himself heard on the matter of foreign, or "international", affairs. But on the matter of the "Chicken War", he was peculiarly silent. Though the interests involved, the farmers, constitute an important element in electorates, it was the one element that Rockefeller did not attempt to win over to vote with promises of everything that their hearts might desire. The reason is that Rockefeller is waging the "Chicken War" on the American producers. He knows that they can be won over only by his foregoing the opportunity to "make money" that he has created for himself by the "Chicken War".

Rockefeller control of the press and the censorship exercised by their agents have carefully withheld from the nation the ugly truth of the situation. There have been numerous newspaper stories and radio and television broadcasts on the "Chicken War", on the discrimination by the EEC against the American producers and on the injury it would do our sad trade balance. There were reports of retaliatory measures. But never once was the public told the truth about the "Chicken War", because the truth would lose Nelson Rockefeller the support and the votes of the groups involved. There is also the fear that if the truth were exposed, public outcry would force an end to the conspirators' "foreign (Rockefeller) aid" thievery.

The Kennedy Administration was helpful. Its representative in the matter was none other than Nelson Rocke-

feller's pal and agent, Eisenhower's "Republican" Secretary of State Christian A. Herter, who has never hurt the interests of the conspirators. The idle gesture of imposition of retaliatory tariffs on certain imports from the EEC, it is reasonable to assume, will do no injury to the interests of the Rockefeller Empire.

The U. S. News & World Report gave the first inkling of the situation in an article in its September 23, 1963 issue (p. 88). It was intended to "calm the storm" with the assurance that the matter "will be strictly academic in a few years". That will be small comfort to the farmers and poultrymen who will have been driven out of business in the interim.

The article related the story of Nelson Rockefeller's pseudo-"philanthropic" business that he set up in 1947 under the name "International Basic Economy Corporation," that follows the Soviet style designation of IBEC. Its purpose was private exploitation of the "foreign aid" projects that he had launched through the Government. The underlying objective of Rockefeller's IBEC enterprise has been gradual monopoly of all necessities of life, similar to that which the Dynasty has so profitably effected through its Milk Trust, and through such devices as chain supermarkets, farms and ranches organized into vertical Trusts. This the article failed to relate.

The article also failed to relate that these private ventures of Rockefeller's are largely financed at the expense of American taxpayers through the fraud of so-called "foreign aid" that was conceived and lobbied through Congress by Nelson Rockefeller personally; and that it constitutes an enormous source of loot for the Dynasty. It also failed to relate that American taxpayers are required, by various bills lobbied through Congress by the conspirators, to guarantee the safety of the "foreign aid" loot that the conspirators invest in foreign lands and of the profits thereon that accrue to them. It also failed to relate that both the loot and the profits are exempt from American taxes and constitute an ideal addition to their tax dodges.

Rockefeller, the article relates, teamed up his IBEC with Arbor Acres Farm Inc. to engage in the chicken business throughout the EEC markets, as well as in other foreign lands. The headquarters of this chicken business of "philanthropist" Gov. Nelson Rockefeller is in Aprilia, Italy. It supplements the chain of supermarkets that offer cutthroat competition to the native tradesmen. In Italy alone, Rockefeller most profitably produces and sells millions of

chickens each year. It and its Rockefeller owner are major factors in the takeover of the EEC markets from American producers and locking them out.

The article does not intimate the uglier aspect of this "foreign aid" conspiracy. This information had been published at an earlier date by the Wall Street Journal in the form of a statement that Rockefeller was establishing a chain of supermarkets in Italy with "counterpart funds", with financing by the American taxpayer. At a meeting of IBEC's stockholders, it was announced that this financing was provided in the amount of approximately six hundred million lire of Italian "counterpart funds". And feed for the chickens is furnished virtually gratis by American taxpayers and farmers.

This operation of Rockefeller's throws light on the modus operandi and technique of modern Rockefeller brigandage and racketeering. With few exceptions, Rockefeller's "foreign aid" bills were designed, as has been related, to evade the provisions of the Johnson Act which bars American loans to any foreign lands that fail to repay their earlier loans. The arrangements in these Rockefeller measures effectively barred the possibility that the "swag" would in any wise be reduced by repayment of any part of it to the looted American taxpayers. With characteristic Rockefeller "philanthropy", it was provided that none of the loans would be repaid to the American Treasury. Repayment would be made, supposedly, into "funds" set up in the various lands, not in American dollars that had been "loaned", but in the native currency of the "aided" lands—at highly depreciated rates. It is a curious fact that none of the lands acknowledge having received more than a fraction of the "loans" which our Government announced had been given them. And no one has succeeded in tracing the fate of the balance.

These so-called "counterpart funds", it was arranged, can be used only in the "aided" land in question, for vaguely specified purposes. In order to insure acquiescence of the members of Congress and to guard against too rigid investigation and accounting of the "counterpart funds", it was provided that members of Congress visiting those lands could make unlimited drafts on those moneys for their own use.

At a later date, the conspirators lobbied through Congress a bill that provided that a specified fraction, originally 25%, of the "counterpart funds" must be turned over to private enterprise (obviously meaning themselves, if one judges by subsequent developments) for the financing of business in those lands. With these funds the conspira-

tors have taken over and financed a multitude of industries in numerous lands that offer cheap labor. They offer cutthroat competition to American industry and labor. In many instances, such as their Japanese steel and transistors, their Italian shoes, typewriters and clothing and their ceramic products and crockery from numerous lands, the conspirators reduced tariffs for the products of their American-taxpayer-financed, overseas industries. This has resulted in the injury, ruin and bankruptcy of American industries and unemployment of American workers on a huge scale.

In addition to this reward for the "drafted" American involuntary financiers of this betrayal of themselves, the conspirators are using these moneys to undermine the dollar. The flood of these cheap imports has been used by the conspirators to create an unfavorable balance of trade for the U. S. Their foreign dollar credits thus created are being used by them to sluice off their gold loot hoarded in their domestic "Federal" Reserve Bank accounts to the accounts of their foreign banks of issue. Though this merely means that the gold is transferred from one room of the "Federal" Reserve Bank, reserved for domestic gold, to another room in the "Federal" Reserve, that holds the gold "earmarked" for their foreign accounts, it is being used by the conspirators to take advantage of the grip that the "gold myth" has on the popular imagination to create a domestic scare regarding the solvency of the Treasury. They now plan to intensify this by completely eliminating backing of our currency with gold. This scare, in turn, is being used to facilitate still another form of looting and brigandage which the author describes in his **THE "FEDERAL" RESERVE SYSTEM & THE ROCKEFELLERS**, (10) hastening U. S. insolvency and gold withdrawals.

Rockefeller and the Dynasty, in brief, are waging a financial and industrial war on our country of which the "Chicken War" is a minor aspect. It is merely a single facet of the conflict of interest, of the ruthless looting of American taxpayers, of the shameless racketeering that the nation suffers at the hands of these racketeers and brigands. It sadly confirms the unheeded prediction made by the Supreme Court in 1911 when it handed down its decision ordering the dissolution of the Standard Oil Co., to wit: if the conspirators are permitted to carry on they are certain to destroy our Republic.

With these facts in mind, it becomes easy to understand Gov. Nelson Rockefeller's bitter opposition to the demands of American patriots that there be terminated the treasonous "internationalism" of Communism and New

Dealism that have meant decades of looting and betrayal of our country, and have brought us to the verge of insolvency and financial dependency on lands that we have "aided", including the Soviets.

President Kennedy hailed in his July 4, 1962, Independence Day speech made in Independence Hall, Philadelphia, the dependence of our country on the conspirators and their foreign allies, which is rapidly reducing us to political and financial colonialism. He advanced his "Declaration of *Interdependence*" as a replacement for the Declaration of Independence. It must have delighted Archbishop John Krol, to whom it was specifically addressed. And Gov. Nelson Rockefeller who sat in the audience with his gubernatorial colleagues of the membership of his "1313" Governors' Conference, was noted applauding this renunciation of the Declaration of Independence and, by implication, of the Constitution.

Nelson Rockefeller has forcefully expressed his determined opposition to any relief from the treasonous betrayal of our country effected by the conspirators. Warren Weaver Jr. reported in a special dispatch to the New York Times of October 20, 1963, that Gov. Rockefeller opposed the demands of American patriots, as expressed by Sen. Barry Goldwater, that there be brought to an end our national betrayal primarily by our withdrawal from the principal agencies in which Rockefeller and his Red accomplices have trapped us for their treacherous purposes: the so-called "United" (more accurately described as dis-United) Nations, the International Bank for Reconstruction and Redevelopment (also labelled the "World" Bank, though the label "Rockefeller Bank" would be more accurate) and so-called "foreign" (more correctly "Rockefeller") aid. (89) In a campaign speech made before the students and faculty of Colby Junior College, at New London, New Hampshire, Rockefeller is quoted as saying:

"I disagree with Senator Goldwater's positions on each of these three issues *because I feel that they are not in the best interests of the American people*".

It would not have been in character for Rockefeller to have stated honestly:

"I disagree with Senator Goldwater because these three betrayals have been put over by me for the purpose of looting and despoiling the American people and enslaving them. Their perpetuation would be in the best interest of myself and my fellow conspirators."

That is the truth of the matter. As has been related, Nel-

son Rockefeller spent the major part of three decades building up the coordinated machinery for looting the nation and the world that is constituted by the three agencies from which he is acutely aware every loyal American, every patriot, hopes and prays our country can be extricated.

Bearing these matters in mind, one can readily discern that Nelson Rockefeller and the Dynasty would prefer to destroy the Republican Party from within rather than to risk the chance of permitting American patriots to wipe out the racket that he has built up and that is proving so enormously profitable to him and the Dynasty. That has been the real purpose, from the start, of his bi-partisan, or more truly omnipartisan, activities since the day he entered his acknowledged behind-the-scene role of political boss of Franklin Delano Roosevelt and the New Deal.

Even a cursory examination of the situation reveals how great would be the loss to the Rockefeller Dynasty and their Soviet partners that would be inflicted by the repudiation of those treacherous "internationalist" agencies by our country. Since Nelson Rockefeller and his subversive associates, including Lauchlin Currie and Alger Hiss, saddled them on the nation and its taxpayers, all effective resistance to the spread of Communism around the earth has been blocked by them. One of the obvious results of their activities has been to impose Communism on Cuba and to bring their "internationalist" conspiracy that much closer to their planned takeover of our own land. Their takeover of the Congo is a case in point.

A clear-cut picture of the meaning of the takeover of a land by these conspirators can be seen in the Congo situation. Rockefeller's interest in the Congo was aroused when, during the 1950's, Belgians sold the Rockefeller brothers a large block of stock of the Union Miniere du Haut Katanga. This served to focus their sight on the wealth of loot in the natural resources and the absurdly cheap labor of the Congo. The Belgians had made huge investments in the development of Katanga in which they were joined by the Societe Generale, in which the Jesuit Order is reputed to be a dominant factor. And at the cost of many lives and intense dedication, they had begun to wean the Congolese tribes away from savagery and cannibalism.

In the Rockefeller tradition, partners are only tolerated until it becomes readily convenient and possible to oust and loot them. Their "United" Nations ideally serves that purpose. The Rock Mob made an intensive personal survey of the situation. John D. the Third, as active head of the

foreign interests of the Dynasty, had made a survey of the riches of Africa and Katanga prior to the purchase of the stock.

"Following a two-month trip to Africa in 1948, John D. 3rd returned (to the U. S.) on November 14, so filled with enthusiasm about the commercial and industrial potentialities of that continent that it took all the efforts of his public-relations counsellor to divert his N. Y. Times interview to the supposed interest of his journey 'in connection with his work as Trustee of the Rockefeller Foundation,' the health and welfare of the natives. Since then subversive agitation among the natives has risen to a new high level, fostered by such organizations as the Rockefeller-subsidized Urban League, under the stimulation of such Rockefeller pawns as Ralph J. Bunche. On January 18, 1951, John D. Rockefeller 3rd was present at a dinner given in Bunche's honor by the Trustees of the Phelps Stokes Fund to signalize his receiving the 1950 Nobel Peace prize. He lauded Bunche following a speech by the latter in which he predicted: '. . . it will not be many years before the same kind of upheaval now appearing in Asia (Rockefeller-Soviet Axis inspired) will be witnessed in Africa'." (11, pp. 39-40)

The above account predicting the plans of the conspirators was published by the author in 1952. The Rockefeller program for Africa, plotted in their Foundation more than a decade earlier, had become an official part of the Communist "Party Line". It was listed as such by American Communist Party leader Earl Browder, in his *TEHERAN—Our Path In War & Peace*. (90, p. 53) Subsequently it appeared as one of the express objectives of Nelson Rockefeller's Point 4 program.

The signal for the outbreak of violence in Congo was the day of departure of David Rockefeller from the Congo, in company with Ralph J. Bunche, an official of the "United" Nations and a dedicated agent of the Rockefellers who has since been appointed by them to their Foundation. The pretext used by the conspirators was the so-called "evil" of colonialism and the "principle" of "self-determination". Both of these hypocritic devices have served them well in looting and enslaving the world, in expansion of the Rockefeller-Soviet Axis and in spreading the domain of the Rockefeller Empire.

The plot and plans of the conspirators were deeply laid. But they were dug out and brought to the light of day by Congressman Bruce, of Indiana, on the floor of Congress. (105) He revealed the fact that the strategy of the conspirators was to steal the property of the Union

Miniere du Haut Katanga. This was to be done through a Swedish iron mining complex, Grangesberg, that had originally been developed by a kinsman of the Duke of Edinburgh, Sir Ernest Cassel, but is now controlled by the conspirators. The President of Grangesberg is none other than Bo Gustav Hammarskjold, whose brother was appointed Secretary General of their U. N. Another officer of Grangesberg, Captain Linner, was placed at the head of U. N. Armed Forces, to personally direct the operation. Dag Hammarskjold met his death while on the scene of the operations in the Congo, when his plane was shot down, and his criminal mission ended.

Bruce's report made it clear that though Rockefellers were part owners of UMHK, (105, p. 18139) their greater interest is in their Copper Trust headed by the Anaconda interests. (105, p. 18140) He points out that Katanga copper production constituted the bulk of the overproduction that was holding down the price of the metal; and that the object of the conspirators has been to stop the Katanga production in order to enable the conspirators to "manage" the copper market in the same manner as they do other necessities, including milk, chickens, eggs and oil. He reported that the ousting of the Belgians and the fraud of "freeing the Congo of colonialism" was planned well in advance by the conspirators to facilitate their thievery. The agency through which they accomplished the rape of the Congo (as in the case of many other lands) was the Rockefeller-Soviet Axis agency, the "United" Nations.

Dag Hammarskjold, the brother of the President of Grangesberg, had been appointed by the conspirators to the post of Secretary General of the U. N., and Trygve Lie had been ousted, to prepare the way for the crime. Hammarskjold, in turn, appointed to various "United" Nations strategic posts in the Congo, officials of the various companies composing the interlocking network of the Copper and Metal Trusts. These included Sven Schwartz and Sture Linner, as well as several representatives of the American sector of the Trust.

The American accomplices in the conspiracy cited by Bruce are most interesting in view of subsequent developments. He heads the list with "President John F. Kennedy" (105, p. 18138; p. 18142), and his State Department that is headed by another Rockefeller employee and Red CFR agent, Dean Rusk. The two men in the State Department who directed the Washington end of the conspiracy are both Rockefeller CFR agents and former officers and attorneys of the Trust. Fowler Hamilton, a

director of the Liberian Iron Ore Ltd. (LIO) which is one of the units of the Trust, resigned his directorship to enter the State Department (105, p. 18146) as a subordinate of a former partner of the Paris branch of his law firm (that represented the Trust in these activities), George Wildman Ball, Under Secretary of State in the Kennedy Administration. (105, p. 19148) Fowler Hamilton later became Administrator of the Agency for International Development (AID) in the State Department, where he was in excellent position to further the thievish and murderous Congo conspiracy.

The purposeful character of the tie-in of Hamilton's law firm with the Trust unit LIO is indicated by the fact that when he resigned his directorship in the company, he was replaced on its directorate by another member of the firm, his law partner, Melvin C. Steen, (105, p. 18146) where he "represented the American partners of the Swedish-American combine". The president of one of the key units of the Trust, the Liberian American Swedish Minerals Co. (Lamco) which had been formed by merger of Swedish interests with the International African American Corp. was another Rockefeller CFR agent and distant kinsman, Johnston Avery. It had employed Linner up to the time that he resigned to immediately be appointed by Dag Hammarskjold resident UN representative in Congo on the day of its "liberation," July 15, 1960. Thus the setting for this horribly "grandiose" crime was perfected.

The role played by the Communist partners of the Rockefeller-Soviet Axis in this phase of the conspiracy was graphically described by Bishop Fulton J. Sheen in his column in the Brooklyn Tablet of April 15, 1961 (106) that is quoted by Bruce (105, p. 18137-8). Dag Hammarskjold's Red successor, U Thant, pledged his support of the rape of Katanga, giving

"... specific assurance *in writing* that the bombs would be used only against Katangan military aircraft on the ground and against airstrips used by them." (105, p. 18150)

As might have been expected of a Red, his pledge proved not to be worth the paper on which it was written.

Another Rockefeller CFR Red, American Ambassador to the UN, Adlai Stevenson is quoted by Bruce as having stated

"The United States is very pleased with the plans of the Secretary General to bring Katanga under control." (105, p. 18150)

The Bilderberg group, another Rockefeller "international-

alist" front that, as related, they have set up under the auspices of Prince Bernhard, the consort of the Queen of Holland includes a number of persons who have played key roles in the rape of the Congo. Among them is the Swedish banker, Wallenberg, president of the Liberian Iron Ore Ltd. which is the holding company for Lamco. The Rockefellers are represented in it by David Rockefeller personally. Bruce succinctly sums up the situation in his words:

"And all of this in the satanic hypocrisy that cries to Heaven for revenge—in the name of peace, committed by . . . our elected and appointed leaders—in your name and mine.

"What a tragedy . . . in treasure, and lives, in brutality and horror, in maimed bodies and broken hearts." (106, p. 18138)

Failing to realize the true nature of the conspirators, Bruce wrote:

"You would expect Communists and lunatic leftists to be against business enterprise, but it is hard to see why heirs to great fortunes like the Kennedys, Harrimans and Rockefellers, or the beneficiaries of large foundations, like Secretary of State Rusk, or former corporations attorneys for huge foreign cartels, like Under Secretary of State Ball, would not see many virtues in a republican form of government . . ." (105, p. 18151)

Bruce would be less puzzled if he stopped to reflect that those fortunes are based on gangsterism and thievery, and continue to thrive thereon; and Communism is the most perfect of thievish devices, that makes possible the looting of whole nations through their governments and are most useful tools for the Rockefellers and their ilk; that foundations are the most convenient of their larcenous tools on the domestic scene, until such time as they find it suits their convenience to impose Communist totalitarianism or its royal counterpart on the nation; and that the agents who serve them in their foundations are, at heart, as vicious vultures as are they.

The Congo affair reveals once again, as did the conspirators' uses of the Marshall Plan, the vicious treachery of Nelson Rockefeller's "Chicken War" and most importantly the treason that involved us in two World Wars, the Korean "police action" and an endless series of minor wars and sell-outs, the true reason for their dedication to so-called "internationalism", "foreign aid" and "United" Nations and the enormous loot that accrues to them therefrom. Can one wonder that Nelson Rockefeller de-

mands that the platform of every political party pledge it to his "foreign aid" schemes, to "internationalism" and to support of their Rockefeller-Soviet agency, the UN?

The Congo affair clearly reveals the criminal and murderous intent of the conspirators. Katanga, which is the most highly developed region of Congo that approaches most closely to civilization, wishes to exert the so-called "principle" of self-determination and to secede from the primitive, savage part of the Congo. The Katangese and the people who had spent their lives and fortunes in developing Katanga wished to continue to enjoy the measure of civilization and development that they had attained. Katanga's resolve to peacefully retain its civilization and developments would have frustrated the thievish objectives of the conspirators who masked their criminal intent with the slogan: "Freedom from colonialism". The Katangese, in all honesty, opposed to the looting of their Belgian patrons and mentors, and rose to oppose the thievery of the "internationalist" thugs operating under the cover of their "United" Nations agency.

The Katangese soon discovered, however, that the "principle" of self-determination that had been enunciated for the conspirators by their unprincipled agent, Pres. Wilson, and adopted by their criminal U. N. agency, would apply only if they "determined" to submit to rape by the Rockefeller-Soviet Axis. When they refused to become colonies of either the Rockefeller Empire or its Soviet partner, the Katangese discovered that the supposed "riddance" of benevolent and valued "colonialism" by the Belgians meant for them victimization by a revival of savagery and cannibalism that had almost been eliminated.

Rockefeller asked the questions regarding the preservation of U. S. and world security and their dependence on "foreign (Rockefeller) aid" and the "United" Nations, with tongue in cheek and in sheer hypocrisy. As one of the chief beneficiaries of those criminal and subversive devices, he well knows that they are the principal agencies for destroying the security of the U. S. and the world and for impairing the solvency of our country. Who does he think he is duping with those questions? Does he really believe that we have all been moronized by his Dynasty's and its Soviet partner's propaganda and brainwashing? Or does he believe we are all a bunch of imbecilic "peasants"?

THE ENTIRE RECORDS OF BOTH THE CONSPIRATORS' "UNITED" NATIONS AND OF THEIR "FOREIGN AID" PROVE BEYOND ANY DOUBT THAT THEY PROVIDE SECURITY ONLY FOR THEM-

**SELVES, THEIR EMPIRE AND THEIR SOVIET PARTNERS. AND THEIR CONTINUED EXISTENCE INSURES STEADY ADVANCE OF THEIR CRIMINAL CONSPIRACY.**

Rockefeller's bleating plea for the progressive Federal income tax that is one of the basic features of the Marxist conspiracy, is equally false. He is well aware that the prime purpose for which the Dynasty had his grandfather, Sen. Nelson Aldrich, introduced the XVIth Amendment, on which the Federal income tax is based, was to enable them to use the Government to pry into the business affairs of everyone and to loot us at will and without limit. Another purpose was to make sure that no one would be able to build up a fortune that would rival theirs. Rockefeller is well aware that other taxes such as the excise tax and import duties do yield sufficient for all our legitimate Governmental financial needs. It is a matter of record that the entire yield of the income tax is consumed in paying the deficits of more than seven hundred Government corporations and "authorities" set up by and for them, that are illegitimately engaged in competition with private industry, are being deliberately mismanaged for the purpose of looting of the nation, and constitute devices for "making money" for his Dynasty and the conspirators by various means, both direct and indirect, as in the case of "foreign (Rockefeller) aid". Rockefeller also is well aware, from personal experience and profits, of the amount of thievery involved in Government "defense" expenditures and their deliberate use by the conspirators to "progressively" loot the taxpayers by the simple device of raising the tax levied to ever higher levels to which there is no limit in the law.

It is about time that Rockefeller and the Dynasty show a bit of the "fiscal integrity" which he falsely claims, by putting an end to the tax evasion, so-called exemption, which they have provided for themselves by the tax laws and regulations that they and their agents have written. Examples are the so-called "charitable contributions" Sec. 1.170-2, which in effect exempts from taxation persons whose contributions and taxes, if paid, would amount to 90% or more of gross adjusted income; the sections which exempt from tax income earned overseas; and the sections which exempt "philanthropic" foundations, even though they are used to finance business interests. It is safe to say that if the Rockefeller Dynasts would honestly pay the taxes on their trillion dollars a year income, the taxes which the rest of us have to pay would be cut to a small fraction of the present amounts. And Rockefeller would

be less anxious to increase the tax rate at every turn, but would be the first to demand its elimination. Being virtually tax-exempt, and profiting so heavily from the taxes the rest of us pay, one can understand Rockefeller's anxiety for a constantly rising progressive income tax. Especially interesting in this connection is I.R.S. Director Caplin's published statement that he does not pay the 91% tax on his income bracket.

For the rank and file of the nation, their "peasants", the progressive income tax, for which Rockefeller so plaintively pleads, means a marginal existence. It means scraping and scrounging, scheming and conniving, cutting corners and doing without, to provide their families with necessities of life. For many, even those in the higher income brackets, it means mortgaging their futures to provide an education, that has become so enormously costly because of Rockefeller bogus "educational philanthropies", for their children. If they are caught in the process of evading their income taxes in order to provide for their families beyond the scale of six hundred dollars a dependent, that was set decades ago when the dollar had a high purchasing power, they are heavily penalized and lucky not to be jailed. But when Rockefeller, despite his virtual exemption from taxation, deliberately flaunts and violates the law to finance his nomination campaign and his plan to take over the Government, as has been related, he is let off with apologies.

Were Rockefeller truly concerned with our national solvency, he would call for an end to the "foreign aid" looting. The real threat of insolvency of our Treasury consists of our unfavorable balance of international payments and trade. For a number of years our unfavorable balance has consisted of the "foreign (Rockefeller) aid" plus the payments for Rockefeller's foreign oil development and imports. These facts reveal the attack made by Rockefeller on the program of patriotic Americans and their champion, Sen. Goldwater, as sheer treachery and hypocrisy.

Rockefeller's attack on his opponent's suggestion that social security be placed on a voluntary basis and the allegation that it would "bankrupt" and destroy the system, is absurdly false. For social security has never been put on an actuarial basis that would provide sufficient income for the payment of claims against it; and in that sense, it has been insolvent from the start. That has been the chief concern in its administration, plus the added fact that indirectly all funds collected find their way into the Treasury to be used to defray current general government expenses. The deficiencies in the social security funds are made up

by the general tax levies. Consequently, the greater the number of persons *who do not join in* the social security program (as is the case with doctors and other professionals) the lower is the drain on its funds and the lesser is its degree of insolvency. Since under a voluntary social security system, it would be the larger earners, who would draw the larger pensions, who would stay out of the program because they can more advantageously provide for their own security, the advantage to the system of a voluntary basis is obvious. Instead of making the social security system insolvent, placing it on a voluntary basis would make it more closely approach solvency and more secure. Rockefeller's campaign issue with which he undertook to dupe New Hampshire voters, is his characteristic fraudulent misrepresentation of "fiscal integrity".

Rockefeller has repeatedly affirmed his dedication to thievish, revolutionary "internationalism". One can readily discern in his statements and publication the Red, "liberal" and at times Communist views of his ghosts. Rockefeller and his agents have been largely responsible for imposing them on our country as the outstanding feature of Roosevelt's regime, the so-called "New" Deal, in which he played so dominant a role. Nelson Rockefeller's every activity is an expression of it in practise. He likewise played a key role in imposing it, subsequently, on the Truman and Eisenhower regimes, as has been related. Rockefeller's "BRAINS", Francis Jamieson, however, was too shrewd to expose his boss by ghostwriting open declaration of the thievish, Communist "principles" for him to declaim.

After the death of Jamieson, Nelson Rockefeller's choice of alleged "brain" to do his thinking and ghostwriting for him was less discreet. He chose an avowed and dedicated Red, so-called "liberal", Democratic New Dealer who was more in accord with his own sympathies. Emmet John Hughes, a Princeton graduate, has been long associated with the "liberal" press: as correspondent in Europe and in Spain for Time Inc., at which time he wrote THE CHURCH & LIBERAL SOCIETY and REPORT FROM SPAIN both of which had a Red slant. On his return from Europe, he became an editor of the notoriously Red FORTUNE magazine, of which it has long been rumored that it was hopeless to seek employment unless one were a cardholding member of the Party. Hughes also served as editor of LIFE. He was chosen by Pres. Eisenhower, in accord with the latter's invariable choice of Communists or Reds to ghostwrite his views, speeches and publications, as his adviser and ghostwriter in his 1952 and 1956

campaigns, and during the first year of his first term.

Hughes boasts in the blurb on the front flap of his latest publication, that he helped draft many of Eisenhower's major addresses and messages. In that book of his, **THE ORDEAL OF POWER**, he exposes himself as endowed with the usual treachery and deceit (91) that are the pride of all "liberals" and Reds, their so-called "principles." Much in the same manner as characterizes Rockefeller for whom he has ghosted, Hughes attacked Eisenhower for uttering the ideas that he had ghosted and for following the plans that he had advised. One gathers that the chief fault that Hughes attributes to Eisenhower is that he was not more "liberal" than himself.

In the aforementioned blurb, Hughes further boasts that he was "Senior Adviser on Public Affairs to the Rockefeller Brothers." But he makes no mention of his identification with Rockefellers in their IBEC swindle. He still is one of its Directors, according to its 1962 report to its stockholders. His identification with Nelson Rockefeller personally, however, becomes quite clear when one compares the views expressed by Hughes, in his books, and those stated by Rockefeller in the Godkin Lectures that, in 1962, he delivered at Harvard University and subsequently published under his own name as **THE FUTURE OF FEDERALISM** (42). The content of these lectures leave little room for doubt that at the very time that Hughes was inditing the attack on Eisenhower, Nixon and the Republican Party he was being subsidized by bogus "Republican" Nelson Rockefeller and ghosted the latter's Red, "internationalist" speeches.

Later, still further evidence came to light that confirmed their relationship. Hughes's attack, **THE ORDEAL OF POWER**, was published by Atheneum. Several months later the same publishers released a paperbound edition of Rockefeller's ghosted book. On October 1, 1963, the publisher ran a large and costly display advertisement on Rockefeller's **THE FUTURE OF FEDERALISM** in the New York Times. And they announced in the news columns of the Times that the sum of \$40,000 would be spent in the advertising of the 95¢ paperback, even though it would cost the entire profits on more than 700,000 copies to pay the costs of the advertisements alone. And the publisher acknowledged that it was a certainty that no such number would be sold. Another full page advertisement appeared in the highly costly Sunday books supplements. It appears highly improbable that the publication of the two books by the same publisher was a mere coincidence, and was not inspired by the same persons with the

identical purpose of denigration of other leaders of the Republican Party and of building up Rockefeller's "image" as its leader and imposing his New Deal, "liberal" program on it once again as he had done during the two previous decades.

Nelson Rockefeller and/or his ghostwriter (or ghostwriters) in **THE FUTURE OF FEDERALISM**, undertake to perpetrate on the nation and the world a cruel deception and tongue-in-cheek hoax. The lectures are a practise in the dialectics that characterize Communism and other forms of totalitarianism. His use of the word "federalism" is a crude semantic perversion of the term. It is "double-talk".

Nelson Rockefeller's "Federalism" is not the governmental arrangement defined in the Constitution—a union of independent States that for the purpose of common good and self-preservation delegate a limited number of highly restricted, specified powers to an organization consisting of their elected and appointed representatives. The Rockefeller Dynasty and their fellow conspirators have done a thorough job through their "New", "Fair" and "Ike" deals, of destroying that concept. They have succeeded in gradually concentrating and centralizing ever more power, both political and financial, into their own hands, robbing the States of their rights and converting what was our Federal Government into a virtually private monopoly of theirs. In other words, under the leadership of Nelson Rockefeller and fellow conspirators, they are converting our Federal Government into the pattern of Illuminist-Communist dictatorships blueprinted by Weisshaupt and Marx, and modified for the American scene by their agent, Hoffman Nickerson.

What Nelson Rockefeller and/or his Red ghostwriters call "**THE FUTURE OF FEDERALISM**" is a Sovietized world dictatorship. In true Rockefeller tradition, they pretend to be opposing and fighting the very organization that they control, "internationalist", Soviet Communism. Indeed, Rockefeller acknowledged in his lecture that the form of the "Federalism" which he advocated is identical with that of the Soviets. But, he alleged, he and his fellow conspirators could do a better job of it. This is a familiar echo of the platforms which he has succeeded in imposing upon both the Democrat and Republican Party to make it fully match that of the Communist Party. He alleged:

"The Communist new order itself, incidentally, is based on a *false federalism* whose pattern may be found in the Soviet Union itself. . . . the Communists have merely taken our words, our forms, our

very symbols of man's hopes and aspirations and have corrupted them to mislead and to deceive in their quest for world domination." (92, p. 66) He failed to give this statement its full significance when he omitted:

"Even as I am now doing."

Nelson Rockefeller's ghostwriters have rendered a real service, however, in revealing the deceit and treachery of their master (and themselves) in the "doubletalk" and contradictions that they trick him into enunciating, entirely unsuspectingly. For example, they have him mouth:

"And it urgently requires, I believe, that the United States take the leadership among all the free peoples *to make the underlying concepts and aspirations of national sovereignty truly meaningful through the federal approach.*" (42, p. 74)

And how does, and has, he undertaken to "make national sovereignty more meaningful"? By destroying nationalism and patriotism and making the nation-state seem anachronistic, exactly as he and his Dynasty and its "Philanthropic" Foundation Trust have been attempting to do in our country. The words that he mouthed on the subject, in language and rhetoric that would earn a failing mark in a high school course in English, are:

"And so the nation-state, standing alone, threatens in many ways, to seem as anachronistic as the Greek city-state eventually became in ancient times." (42, p. 64)

In other words, Rockefeller seeks to make national sovereignty "more meaningful" by destroying it and replacing it with Red "internationalism", because it is more profitable for the Dynasty. For nothing is "meaningful" to the grasping Rockefellers unless it involves inordinate gains or loot.

Rockefeller acknowledged his role in carrying out Adam Weishaupt's Jesuitic Illuminist-Communist "United" Nations conspiracy. (42, p. 77) He also affirms that it has been a failure in maintaining world peace; and that it can not serve any other purpose than a debating society, in the following words:

"The United Nations has not been able—nor can it be able—to shape a new world order . . . the UN lacks the strength to master or control the forces that it confronts . . . is a forum . . . a channel for daily communications . . ." (42, pp. 64-5)

This "forum" has cost the lives of thousands of GIs. No Rockefeller has fallen! To them it means "security"!

Rockefeller failed to make mention that the very real and effective service of the "United" Nations, for which

he helped design it, has been to paralyze any resistance to the expansion of the Rockefeller Empire and its Soviet partner in the Rockefeller-Soviet Axis, to the world-wide spread of the thievish, murderous Communist scourge. With the duplicity and sham on which the Rockefellers pride themselves, he lays the blame for this sought-for accomplishment on their own Soviet agents. But when American patriots and so-called conservatives make the same estimate as his own of the UN the basis for demand for our withdrawal from the surrender of our sovereignty that he helped his pal, associate and agent Alger Hiss, effect, he attacks them and their champion Sen. Goldwater as the "radical right" and "a menace." Can one have better proof that the disuniting "United" Nations is serving well and most profitably the purposes of Rockefeller and his gang despite his pretense of dissatisfaction with it? Can it be doubted that his Red ghostwriters realized that the brainwashed morosity of his Harvard University audience would blind them to the absurd contradiction and disregard of the truth involved in his lectures?

Rockefeller's pronouncements, it has been rightly stated, however respectfully, by Robert Welch (93, pp. 6-7) are identical echoes of the Communist Youth magazine, *Konsomolskaya Pravda*. This gentle rebuke came as something of a surprise. It was elicited by a vicious frontal attack made by Nelson Rockefeller on Welch and the John Birch Society, that prior to then had been regarded by many as useful tools of Rockefeller for use by him and his fellow conspirators as whipping posts to discredit patriotism, patriots and all who oppose his "internationalist" thievery. Some support appeared to be lent to this view by several things. First, Robert Welch confessed in an interview given the New York Times that he was a member in good standing of a Red, subversive organization that long has been financed by the Rockefellers, their League For Industrial Democracy. He said that he joined it to find out what the subversives were doing, and maintained his membership in it. Second, a large proportion of the John Birch Society directors have been members of Rockefeller's agency, the Council on Foreign Relations, interlocking them. Only Spruille Braden, Rockefeller's CFR agent, has resigned. But Rockefeller's attack on Welch and his Society elicited from him the gentle reply:

"To the Communists, anybody who gets in the way of their takeover of the United States is a 'lunatic' and a 'fascist madman'. To Nelson Rockefeller, anybody who gets in the way of his takeover of the Re-

publican Party is a member of the 'lunatic fringe' and guilty of 'subversion'. That's a pretty farreaching parallel, Governor, with many puzzling ramifications and undertones". (93)

No one acquainted with Rockefeller's ancestry, his training and the entire range of his views and activities, and with the ghostwriters whom he employs and saddles on his public minions, should find puzzling the identity of Rockefeller's views with that of the Communist Party. Nor should anyone be surprised at the identity of the views expressed by Rockefeller in his Godkin campaign speeches at Harvard with those published by his "liberal" ghostwriter and employee, Emmet John Hughes. In an article written and published in his name in the Empire's Council On Foreign Relations house-organ (13) FOREIGN AFFAIRS of April, 1960, Nelson Rockefeller states, as PURPOSE AND POLICY of himself and his gang, effecting and making a success of revolutions. This is readily understandable when one stops to consider the matter. Revolutions create optimal conditions for looting on the most grandiose scale and yield maximal loot. They are the ideals of the Illuminist-Communist "liberal", especially when coupled with "internationalism" which widens its scope to the entire world and even the universe. He greets the past half century of strife, turmoil, war, violence and brigandage which the Rockefeller Dynasty has played a major role in engineering, with their ghastly toll of fortunes and lives, as "blessings of freedom". He hails the disrupted, absurd tribal aggregates of Africa, reverted to savagery, as a "free world", to the preservation of which he demands that our country dedicate itself. In reality, the only freedom that exists in these scantily civilized but thoroughly Communized "democracies", is the "freedom" to once again enjoy cannibalism; and the "freedom" of the Rockefeller Dynasty and its Soviet partner to loot them. That is the "ideal" toward which, Rockefeller demands, we must strive. (13) The attaining of this "ideal" is characterized by Rockefeller as "political creativity, boldness and vision" (42, p. 4) "invention" and "the federal concept and its evolution". It is all so fantastically insane that it must be classified as mad, "grandiose ideas" about which he had his biographers intone.

Before leaving the "doubletalk" prepared by Gov. Rockefeller's "ghosts" as a campaign speech to be delivered at that hotbed of Communism and New Dealism, Harvard University, in the guise of Godkin Lectures, a review of the bald lies in connection with his Governor-

ship of New York State, stated therein is in order. Gov. Rockefeller represented that he had restored "fiscal integrity" in the State by increasing taxes and reducing expenditures. The baldest of the prevarications was the representation that by increasing taxes he had improved the "economic climate" of New York State for business and arrested the flight of industry. Numerous workers have been forced into the ranks of unemployed in New York by the ever greater of flight of industries, that was forced by the increased taxation, to other States. Whole sections of New Jersey have been built up to accommodate businesses and industries fleeing New York to avoid the Rockefeller tax increase. And not a few of the Rockefeller enterprises were among those that fled the State of New York and Rockefeller taxation, many of them overseas.

But the truth seldom hampers the Rockefellers. Seldom can any critic of theirs manage to gain expression in the media of mass communication, most of which they control (not excepting Harvard) so absolute is the censorship that, as has been related, they have established through such advertising and publicity monopolies as Interpublic Inc. As a consequence, Rockefeller felt free to omit any mention of the outstanding feature of his administration as Governor of New York State in his Godkin campaign speech, even though it has become so notorious that in spite of their censorship, many phases of it have "leaked" out in the press.

The sham of the conspirators' "liberal" and "civil rights" agitation on behalf of the colored is sharply highlighted by the investigation made by the Joint Legislative Committee to Investigate the Rigging of Voting Machines that was created by House Concurrent Resolution No. 33 at the 23rd Regular Session of the Louisiana Legislature. It was published in pamphlet form by W. H. Joe Cooper under the title WHAT YOU SHOULD KNOW ABOUT RIGGING VOTING MACHINES & VOTING MACHINE LAWS. (139) on the basis of demonstrations given them, the Committee reported that both of the voting machines in use in the country, the Automatic and the Shoup, can readily be tampered with and rigged, but the former did incorporate a few devices that might be protective if used.

The report made it clear, however, that with both machines it was readily possible to falsify and completely change the votes and counts. In the case of the Automatic voting machine, for instance, it is readily possible for the mechanic carrying the Zero Key that unlocks the counter mechanism in the model in question, to completely alter

the vote when he "repairs" or "adjusts" the machine. It means that those who control the company that services the machines can readily perpetrate frauds and steal elections. This explains the significance of change of ownership of the voting machine companies, such as occurred before Rockefeller's election as Governor.

Since stolen elections mean disfranchising of one and all, it becomes quite obvious that "civil rights" and poll tax agitation and "reform" are mockery. What matters it if one has the right to vote, if the vote is tampered with and changed, or not counted? This trick of the conspirators represents a material advance over the scheme laid out by their agent, Nickerson.

Gov. Rockefeller, characteristically, has shown nothing but abysmal contempt for that "bourgeois weakness", ethics and morality, in his Administration. He has disdained and/or flatly turned down any suggestion that there be set up by New York State Legislature a code of ethics for public officials that would especially bar conflicts of interest. In view of his repeatedly expressed determination of "making money" in whatever he does, this is completely understandable.

As might be expected under the circumstances, Gov. Rockefeller's Administration has been marked by vicious corruption, outrageous venality, a frank and open spoils system and unabashed nepotism. All of the vilest degenerations and depravities of a government and its officials—have characterized the government of New York State under Nelson Rockefeller as Governor and as boss of the Republican, Democratic and Red "Liberal" parties of the State. Criminal activities such as the racketeering "shake-downs" of liquor licensees have been tracked to the closest and most immediate intimates, associates and appointees of Gov. Rockefeller under circumstances that leave little room for doubt as to their ultimate sponsorship.

Rockefeller's Administration of New York State furnishes a clear-cut picture of the real nature of his "Future of Federalism" that he proposes to impose on the nation and on the world, with himself as boss and dictator. It embodies Rockefeller's "grandiose ideas" that he seeks to expand on a super-Napoleonic scale.

Unfortunately for our Republic, the so-called "dissolution" of the Standard Oil Co. that was ordered by the Court, was defiantly but slyly reduced, in its execution, to a mere mockery by the conspirators. And under the guidance of the Dynasty, and more particularly of its present generation, the menace to our Republic and the world has grown into a conspiracy that falls little short of destroying our

Constitutional government, as it already has destroyed the British, the French, the Dutch and the Belgian Empires.

The Rockefeller Dynasty prides itself on never abandoning a program, plan or plot that promises inordinately rich "pickings", or loot, for their gangsterism and brigandage. It matters not to them how many generations it may require to accomplish their purpose. Like the Chinese, the Rockefellers are ancestor-worshippers. And they pride themselves on their Dynastic "traditions" of plunder.

Nelson Rockefeller is not the only Rockefeller who has had "grandiose ideas" and delusions of grandeur. But he is the only one, thus far, who has expressed the fact openly. And in him, the menace of the Dynasty is highly intensified and is more immediate than it was at the time the Supreme Court made its prediction.

In Nelson Rockefeller, the menace of the Dynasty is greatly intensified by a number of factors. First and foremost is the enormous swag and loot accumulated by the gangsterism and racketeering of four generations during the period of a century and a quarter that is estimated as yielding them an income of more than a million dollars a minute. Second, is their tax exemption by means of numerous devices that they have written into the laws that they have imposed for the taxation of the nation by Federal and local governments. These include in addition to the tax-exemption of their bogus, subversive "philanthropic" foundations, numerous special laws, rules, precedent-establishing Supreme Court decisions, and tax-payer-looting devices as so-called "foreign aid". Third, is their complete control of the finance and credit of the nation and of each and every citizen, and of the world, that they have gained through the establishment of their private stock corporation, the so-called "Federal" Reserve System and of its subsidiaries such as the International Monetary Fund. Fourth, is their immense power derived from these and other devices at their command and their enormous loot, that enables them to make realities of the desires and ideas, no matter how "grandiose". These include subversive brainwashing of the nation through their so-called "educational philanthropies", bribery, corruption, purchase, perversion, disfranchisement through the device of crooked voting machines marketed by their agents and imposed on the nation, and numerous other criminal devices. Fifth, is their corruptly gained and almost absolute control of all governmental agencies,—Federal, State and local—both directly as well as indirectly through the control of an endless array of agencies through their subsi-

dized and endowed organizations including their Public Administration Clearing House ("1313").

One of the most absurdly insane aspects of the Rockefeller psychopathy is the fear of poverty and the quest for personal "security." Inspired by the dread that some criminal genius more cunning and ruthless than themselves might arise and loot and despoil them exactly as they have despoiled the nation and the world, it is the driving force of the Dynasty in their scheme to establish a "One (Rockefeller) World" dictatorship.

This mad fear of poverty has attained its sharpest, most open, and at times fatal, expression in the womenfolk of the Dynasty. Rockefellers, according to their pressagents, generally select their consorts on the basis of their extreme thrift and penuriousness. As wives, they are required to keep minutely detailed accounts of all expenditures, and to practise strait-laced economies, even to the point of restricting the amount of food eaten by their help. It has been common practise among the Rockefeller womenfolk to have peepholes in the doors overlooking the dining quarters of their help through which to observe their appetites. Those who eat more than certain restricted amounts have been dismissed. A lush cousin of Nelson Rockefeller's who has been institutionalized repeatedly for mental and alcoholic therapy, adopted the practise of limiting the food expenditures for each of her help to the sum of twenty-five cents a day.

An aunt of Nelson Rockefeller's (John D. the First's daughter) Bessy Strong, is reported to have resorted to collecting food from the garbage pails of neighbors. Though her financial worth was hundreds of million dollars, she feared poverty and starvation. Taken to France in the hope that her mental state might be improved, she was undoubtedly driven more frantically mad by the absence of food in the garbage pails of the thrifty French households. She is reported to have wrapped herself up in cotton wool, poured kerosene over herself and set herself afire, to have committed suicide, driven by fear of poverty despite her wealth. (9, p. 91)

A cousin of Nelson Rockefeller's, Winifred Rockefeller Emeny, whose financial worth was also hundreds of million dollars, likewise ended her life and murdered two of her children, in fear of poverty. Years before the tragedy, in 1937, her mental condition was diagnosed by the Medical Director of the Boston Psychopathic Hospital of the Commonwealth of Massachusetts Department of Mental Diseases. He recommended her institutionalization in as

discreet terms as were requisite for recommending mental hygiene and therapy for a Rockefeller.

Another Rockefeller cousin is periodically institutionalized because of her identical mental ailment, fear of poverty and starvation. She saves every crust of bread and every scrap of meat, after each meal. She will not even entrust them to her nurses. She places them under her pillow. Her fortune is reputed to be close to one billion dollars. But with characteristic Rockefeller mania, she lives in fear of poverty and starvation. Curiously, the same psychopathy that drives Rockefeller women to madness and self-destruction, drives their men to heights of crime.

Mrs. Nelson A. Rockefeller, after about thirty years of married life with him, in spite of the thriftiness which had recommended her to him at the time of the marriage, rebelled against his penny-pinching penury. And as happens among some of the Rockefeller womenfolk who rebel, she did not mind who knew about it.

Mrs. Rockefeller gave a frank interview, on November 19, 1961, to one of the Dynasty-controlled, Hearst publications, the New York Journal-American. She completely confirmed some aspects of the psychopathy that Nelson Rockefeller himself acknowledged through his pressagents.

In polite phrases, she described Gov. Rockefeller as "non compos mentis" (her expression was "he does not know his own mind"); delusional and hallucinated (her expression was "he thinks he knows what it means" when referring to an absurd smear of paint on canvas that he had purchased for \$50,000, as an "abstract painting"); matching in penurious penny-pinching even in personal expenses, and as fearful of poverty as his grandfather, John D. the First, and other familial psychopaths; and more aberrant and degenerate (her expression was "he treats his household help worse"). Forceful confirmation of the last remark came to light in the following year, when Gov. Rockefeller announced his intention of marrying "Happy", the wife of an employee of the Rockefeller interests, Dr. Murphy.

Since Nelson Rockefeller, his pressagents and his wife agree unanimously on his psychopathic mental state, there appears little room for questioning it. Additional evidence is obvious to anyone who observes him and his photographs that have appeared almost daily, in the press. His facial expressions clearly reveal his lack of emotional control that bespeaks civilized self-discipline, and his emotional instability. His pressagents seek to cover up this obvious deficiency, that persists despite the instruction in acting that he has received from television producer,

"Pat" Sylvester Weaver, by alleging that it bespeaks his lack of guile. (43, p. 307) But his record, replete with craftiness and shiftiness, completely belies such interpretation.

It has been Rockefellers' mad quest for the security of themselves and their loot that has been the nation's chief protection against the carrying of their scheme of absolute, monarchic dictatorship as outlined by their sociologist, Hoffman Nickerson. For, in a dictatorship it is only the dictator who has absolute security. And he has that security only so long as he remains dictator.

In the past, the Rockefellers have not dared come out in open control of the nation because of their fear of public knowledge of their criminal record and dread and hatred of them as expressed in the cited Supreme Court decision. They have been fearful that the public was not yet sufficiently brainwashed by their "philanthropic" agents and agencies to have completely forgotten their malign record.

It was Nelson Rockefeller's brashness and desire to strut on the public scene that led to the dispelling of the Dynasty's fears. This was accomplished at the cost of considerable trepidation on the part of John D. the Second (Jr.) that is reported to have contributed to the shortening of his life. He appears to have considered Nelson in the light of a "juvenile delinquent" who caused him much concern. (43)

This concern was shared by Rockefeller pressagents and public relation counsellors. They did not hide their anxiety from the newsmen on their payrolls and the columnists. They put out numerous "rumors", as "trial balloons", in the press and on the air, of Nelson Rockefeller's appointment to positions in their puppet Pres. Roosevelt's Administration. Thus Walter Winchell published in his column a rumor to the effect that Secretary of Commerce Harry L. Hopkins might appoint Nelson Rockefeller as his Assistant Secretary. Subsequently he announced that this report was a "trial balloon" intended to test public reaction to such an appointment; but that the appointment had been called off because of unfavorable public reaction. It was not until after the conspirators had plunged the world and nation into World War II, that Nelson Rockefeller's appointment to his draft-evading post as Co-Ordinator was risked.

When the plotters discovered that the war-dazed nation had been adequately brainwashed into morosity and oblivion of the criminal and subversive record of the Rockefellers and would complacently accept Nelson as a

public official with vast powers, the nation lost its protection from open dictatorship by the Dynasty that was constituted by its "security" fears. They have been cautiously feeling their way, ever since, to open takeover of the government under their dictatorship, by the buildup of Nelson Rockefeller and other members of the Dynasty as "philanthropists" with public interest. In the course of so doing, they have placed some of their wealthy agents and associates in elective and appointive offices, including Averell Harriman and Herbert Lehman, as precursors of Rockefeller as New York State Governors.

The election or succession of Nelson Rockefeller to the post of U. S. President is an unqualified necessity, a *sine qua non*, of the termination of the plot to convert the nation to a monarchic dictatorship, which by preference would be supercapitalist and Communist in character. This is required by the plotters because of the fact that in a dictatorship, it is only the dictator who enjoys absolute security—so long as he remains dictator. Therefore they do not dare carry the conspiracy to its ultimate goal until one of their number is in the White House. These are the avowed aims of self-revealed psychopath Nelson Aldrich Rockefeller.

This eventuality would bring our country into range of ready conversion into a Communist Soviet and linkage with the conspirators' USSR. The Rockefeller preference for the Sovietization of the U. S. that has been openly expressed by their "philanthropies", their agents, and by Nelson Rockefeller himself (13; 42) is readily explainable on the basis of the fact that Communism constitutes immediate, universal looting of whole nations and the ultimate of security for the thievish dictator. It is also the tradition of many "first families of America" and their professed faiths, and a natural outgrowth of their past interests and activities. (14; 45; 51; 57; 103; 11)

To accomplish the destruction of our Republic from within requires merely:

1. The domination of our governments and their agencies by the plotters. This they have attained in the manners related.

2. Direct personal command of the situation by the "planners". Mistrusting all others as possibly being as ruthless as themselves, the only situation that would satisfactorily assure them of the personal security for which they yearn would be occupancy by one of them of the White House, in the role of President converted to the absolute monarchic dictatorship that Nickerson envisaged (39).

This latter objective would be attained by Nelson Rockefeller grabbing the Presidential nomination of any Party and engineering his election.

The only possibility of checking the execution of his "grandiose idea" is blocking the nomination of this self-confessed psychopath, and eliminating him from the public scene. This alone will not eliminate the Rockefeller menace that is constituted, in addition, by the monopolistic control that they have usurped over our national finances, our Treasury, our money and our banking, as well as over the personal fortunes of each and every one of us through their fraudulent "Federal" Reserve System, the theft of our gold through its agency, their enormous wealth that comprises the loot extracted from us that is aggravated by their tax-exempt status, and their usurpation of power in a multitude of directions, personally and through their agents. These place them in the position of visiting national insolvency, war and numerous other disasters on us for the purpose of forcing us to "yield with perfect docility" to their impositions.

In the scheme advanced by them through financial dictator, brother David, concurred in by Pres. Johnson and concurred in by Congress, they plan to withdraw even the token of gold backing of our currency. This could prove to be "the straw that broke the camel's back" in precipitating our national bankruptcy, and a dictatorship of the Soviet type, as envisaged by Marx, Lenin and Stalin, dominated by the conspirators. However true it is that the gold backing of our dollar is infinitesimal, the removal of the gold and silver backing of our currency would have that disastrous psychologic effect. It can be averted only by blocking the financial conspiracy at its present stage and by restoring to the nation the stolen gold, the dodged taxes, the diverted "foreign (Rockefeller) aid" loot and control of banking and currency by removing control of our finances and "Federal" Reserve from them and returning to Congress and the Treasury. This phase of the conspiracy is the subject of this author's book in process of preparation: **THE "FEDERAL" RESERVE CONSPIRACY & ROCKEFELLER.**

## CHAPTER XXI

### RESULTS OF CONSPIRACY DELINQUENCY, CRIME, DICTATORSHIP

One can hardly expect Rockefeller to change his objectives if we would be so unfortunate as to have him imposed on us as President, any more than one could expect a leopard to change its spots. Throughout his life, both private and public, he has shown undeviating singleness of purpose: "making money" in the role of "boss." His pressagents, biographers and other minions describe him as an "impulsive" character who makes "snap judgments" and is "stubbornly determined", "wants his own way". Consequently there must be expected a continuance of his past activities and policies on an even wider and more intensive scale.

It could be expected that as President, Rockefeller would continue his dedication to "making money". A natural corollary would be the imposition of ever higher "soak the poor" taxes to provide ever more domestic and "foreign (Rockefeller) aid" loot, coupled with ever more tax exemption and evasion for the Dynasty. One could expect ever more dishonesty, corruption and nepotism. Further betrayal of our country and sovereignty would serve to expand the Rockefeller Empire and the Rockefeller-Soviet Axis, with ever wider spread of "internationalism" and Communism and ever more looting and enslavement of us "peasants".

One could expect ever further abridgement of our liberties and substitution therefor of so-called "CIVIL RIGHTS" THAT ARE CIVIL WRONGS, THAT WILL REDUCE US ALL TO THE SAME LEVEL OF SERFDOM. We could expect more frequent and bigger "police actions" and wars, that would provide the conspirators with ever greater opportunities for brigandage. These are only a few of the "blessings" to which we could look forward, if Rockefeller and his confederates were permitted in the words of their "Encyclical", Occasional Letter No. 1, to "work our good will."

One of the most dangerous of the developments fostered by the conspirators for the attainment of their objective of the subversion of the nation and the world and their attainment of a totalitarian and Sovietized world dictatorship, will be fostered and intensified: juvenile delinquency and consequent breakdown of law and order. The following statement that was submitted by the author to the Senate committee investigating juvenile delinquency at the request of its Chairman, Sen. Henning, that was suppressed by the committee, is quoted as an outline of this situation.

**STATEMENT ON JUVENILE COURTS &  
JUVENILE DELINQUENCY SUBMITTED BY  
EMANUEL M. JOSEPHSON M.D. TO THE  
SENATE SUBCOMMITTEE TO INVESTIGATE  
JUVENILE DELINQUENCY IN CONNECTION  
WITH ITS HEARING IN NEW YORK CITY ON  
FEBRUARY 13, 1959**

Sen. Henning has rightly pointed out that the results attained by the Juvenile Courts in dealing with juvenile crime and delinquency leave much to be desired; that during the past nine years there has been a steady rise in juvenile crime. Nothing more need be said to stress the futility of courts as a device for coping with the problem. At best, it can be said that the juvenile courts are an inadequate effort to remedy the evil in a small percent of the cases of delinquency and crime that come before them. The only solution of the problem lies in prevention of delinquency and in remedying the conditions which have given rise to it.

To arrive at a remedy for an ailment, as a rule, it is wise to seek out the diagnosis and cause. No one denies that the root of juvenile crime and delinquency, in most instances, is a breakdown of parental influence and discipline. Therefore, one must first seek out the factors that account for this breakdown. Since under present conditions of high taxes and inflation, often both parents must work to earn a living for their family, and therefore have relatively little contact with their children during their waking hours, influences outside of the home that are destructive of parental discipline must be sought out.

Under our system of compulsory education, under which a child must spend the larger part of the day during ten or more years of its life in school, during the most impressionable ages, our school system is the first factor that must be scrutinized. Concomitant with the rise of juvenile crime, a number of fundamental changes have taken place in our schools, their objectives and their meth-

ods. The principal changes have been the elimination of traditional training and disciplines with special emphasis on elimination of control, so-called "interference", on the part of parents, on the ground of pretended desire to avert the development of "complexes"; and the substitution therefore of a deceitful simulation of "freedom of self expression and the fulfilment of their wishes and desires". Actually, there is substituted a cunning and malign indoctrination that is designed to brainwash the children into the acceptance of ideas, conduct and habits that will make them subservient to the dictates of a ruthless group of persons who have undertaken to use education to effect subversion and perversion. Enforced idleness of the child of school age is dictated by them for the purpose of intensifying the evils that are planned.

This malign plan's origin dates back to the beginning of our Republic, to 1776, when a college professor conceived it as a device to attain World Dictatorship via a United Nations. Named Adam Weishaupt, he founded the Order of Illuminati which is the forerunner of the Communist Party of today. For further information on the influence of this professorial conspirator on our American history, I refer you to my treatise on the subject entitled ROOSEVELT'S COMMUNIST MANIFESTO. It suffices to state that since its origin, this conspiracy has been an educational conspiracy. It has completely dominated the development of our educational system and has slowly and cautiously pervaded it, so as not to arouse an alarmed reaction until it had gained absolute control. It is open to question whether the introduction and development of compulsory, prolonged school attendance by all children was not conceived for the primary purpose of furthering the conspiracy.

The progress of this conspiracy was very slow during the first century and a quarter of our national existence. For our virile progenitors were very mindful of the hardships and vicissitudes of their struggle for a measure of liberty and for survival, and of the discipline that it exacted of them and of their offspring. They permitted no tampering with the age-old, tried methods of child discipline and education. They required of the "little red schoolhouse", that did not dare go Red, that it teach the three R's and that it support and sustain parental discipline. Patriotism, ethics, morality and decency were painstakingly inculcated. These matters were the educational tradition from which the conspirators did not dare to deviate initially in the training of children. Only in the institutions of higher learning, in the colleges and uni-

versities, in the teachers' training schools, did the conspirators venture to spread their poison of subversion.

In the early part of this century, about 1904, a ruthless but sneaky and cowardly group of brigands determined to reach out for the control of the wealth of the world. They discerned in the Illuminist tradition of conspiracy a weapon to serve their cause; and in the ruthless cunning of Adam Weishaupt's precepts and plans, they discerned an "inspired" pattern that they could follow. Basic were his teachings of cloaking the conspiracy in the guise of "philanthropy"; the conversion of education to brainwashing and propaganda; the substitution for patriotism, ethics and morality, of "internationalist" treason, ruthlessness, immorality, crime, violence, and contempt for law and order. The product of their plot was an "educational philanthropy", the purposes of which was stated in a paraphrasing of Adam Weishaupt's precepts that reads as follows:

*"In our dreams, we have limitless resources and the people yield themselves with perfect docility to our moulding hands. THE PRESENT EDUCATIONAL CONVENTIONS FADE FROM OUR MINDS, and we work our own good will upon a grateful and responsive rural folk . . . The task we set before ourselves is a very simple one as well as a very beautiful one, to train these people as we find them to a perfectly ideal life just where they are. So we will organize our children and teach them to do in a perfect way the things their fathers and mothers are doing in an imperfect way. . . ."*

This is not a quotation from the orders of Stalin, Hitler or Mussolini. It is, however, a straightforward statement of intent to break the influence of parents over their children, to cast aside educational traditions of the 3 R's and learning, ethics, morality, discipline, patriotism and others; and a declaration of intent to brainwash the children to serve the purposes of the malign "planners". This is the pattern of so-called "education" that was advocated by the Illuminist, Professor Adam Weishaupt, and has become the practise of dictatorships, both Communist and Fascist, as well as New Deal. The juvenile delinquency and crime that inevitably grow out of such "education", are the basis of adult criminality and the terrorism that results; and these in turn are the very best pretext, with government bankruptcy, for dictatorship and crushing and looting of minorities.

But the above-quoted statement is not taken from the writings of Weishaupt, Marx, Hitler, Mussolini or Stalin. It is quoted from the Occasional Letter No. 1 written

jointly by John D. Rockefeller and his almoner Fred T. Gates (paraphrasing Adam Weishaupt), expressing the avowed intent of their "educational philanthropy", the General Education Board. It was issued in 1904. And this purpose has been so intently and persistently followed by the "planners" and "philanthropists" that as early as March 26, 1917, a man of great prescience, Senator Chamberlain (Oregon) said:

"The Carnegie-Rockefeller influence is bad. In two generations they can change the minds of the people to make them conform to the cult of Rockefeller, or the cult of Carnegie, rather than the fundamental principles of American democracy."

The General Education Board, represented to the nation as a so-called "philanthropy", had no difficulty usurping complete control of education at all levels. Initially it was vigorously opposed, as a conspiracy to subvert education, by the National Education Association; but by subsidy and bribery of key "educators" in that organization, it became completely subservient to the conspirators by the beginning of World War I. Shortly thereafter, the NEA officers openly stated that the purpose of the Association was to effect a counter-revolution and a "new social order". This brought it fully in line with the avowed purpose of the GEB and its Rockefeller masters.

The devices whereby the conspirators converted education into training for juvenile delinquency and crime were numerous. Compulsory subjection of all children to brainwashing at their hands in the schools, during at least a decade, was one of their earliest and most readily attained objectives. Also, under pretense of "protecting" children, they forced through legislatures, with the help of labor unions bent on effecting a scarcity of labor, Child Labor Laws. These laws barred youngsters from entering the labor market and earning a living below a set age; and it also insured that they would not come under any more salutary influence. It condemned the youngsters to exposure to brainwashing; and it condemned them to enforced idleness and, often to enforced penury. The conspirators were certainly not unaware of the fact that idleness breeds vice. In fact, they depended upon it to help accomplish their purpose with the aid of the other measures which they adopted.

Destroying parental influence was readily accomplished by them by the simple device of barring parents from having any say in the matter of how and what their children were to be taught. The so-called "Parent Teachers Association" is merely a thinly camouflaged agency of

the conspirators designed to deceive the participants, in which neither parents nor teachers have any real voice.

Teachers have been brainwashed and indoctrinated, and made witting or unwitting agents of the plotters, before they are given a license to teach. This is the prime purpose in the special training in pedagogy, without which no one, no matter how learned, is permitted to teach in our school systems. The teachers are barred from exercising any discipline or control other than that desired by the plotters. Willy-nilly, every teacher, instructor and professor has been forced to become a subversive plotter, as the price for earning his living, and continuing to teach.

The device that was specially adopted by the plotters for breaking parental control and discipline, and laying the groundwork for utter incorrigibility of youngsters, that inevitably leads to delinquency, and/or criminality, is what they label by semantic distortion of the terms, "Progressive Education". On the pretext of averting the development of that Freudian Communist bugaboo, complexes (by which they mean reaction and behavior patterns not approved by the plotters), it is represented that the children are permitted to dictate what they wish to learn, and to follow their every wish and whim. Actually, it is the conspirators who cunningly warp the children's minds, and instill wishes, desires and conduct—with an eye to the fact that "as the twig is bent, the tree will grow".

This is the real significance of such programs as "Youth Wants To Know". The indoctrinated youngsters are used by the conspirators on mass-communication media which they control, such as lecture hall, television and radio, as sounding boards for their plots and schemes. The implication that those programs are intended to convey, is that if the youngsters are so "wise" as to express the views of the conspirators, no self-respecting adult can afford to disagree.

The chief support and sponsorship of this phase of the conspiracy has come from the Rockefellers who have lavishly financed the operation of the John Dewey Marxist and Weishauptian program of juvenile libertinism that paves the way for delinquency, by a grant in 1929, of \$5,923,747.62 from their Foundation to the Lincoln School of Teachers College of Columbia University. They also contributed equally lavish support to the Progressive Education Association.

The mass-communication media, which are virtually all of them controlled by the conspirators, are being used to good advantage by them in fostering juvenile and adult

criminality. Through newspaper columns, "comic" strips and books, movies, theatre, radio and television, the community is being fed a steady diet of murder, treachery and violence. This has an especially forcible impact on youngsters, many of whom are led to regard brutality and murder as "normal" and "heroic" conduct. Unfortunately, much that takes place on the current scene, especially the ascendancy, immunity from the law, and the ill-gotten wealth of criminals and gansters, reinforces the impressions and beliefs that our children acquire from the mass-communication media.

The control of these mass communication media has been exercised by the plotters through the Ford Foundation which set up a Mass Communication Center at Columbia University. The immense influence exercised by that agency has been a key factor in bringing about the situation above described. The Ford Foundations Fund For (The Betrayal) Of The Republic has kept a close check on the effectiveness of their plot, and the reaction of the public to it. It has recently published a "study" on the subject, entitled "Taste & Censors In Television", in which it expresses alarm at public demands for censorship of the type of television programs that have met with the organization's approval. It acknowledges the role that the medium has had in bringing about a 50% increase of juvenile delinquency as a fact, and as a factor in alarming the public, that they must cope with.

The entertainment media have been used by the conspirators with effectiveness in breaking down the level of public intelligence, taste, ethics and morality. Through those media, they have held up to youngsters as examples and models to be emulated by all who seek success,—Ingrid Bergman, a paragon of virtue; Gypsy Rose Lee, Zsa Zsa Gabor, Marilyn Monroe and Jayne Mansfield, paragons of decency; Jimmy Hoffa, paragon of public service; Al Capone and the Rockefeller "philanthropists", paragons of benevolence; Alger Hiss and Owen Lattimore, paragons of patriotism; and Rocky Marciano, paragon of intellect.

Youngsters are being indoctrinated by such examples that are constantly being held up to them to admire and sympathize with, that indecency, stupidity, crime, violence and treason are the easiest road to success. Every available medium is being used by the conspirators to encourage the rising generations to follow in those paths. Can one wonder that they do so and steadily swell the ranks of delinquents and criminals?

The political climate, as Sen. Henning pointed out, is not improving the situation. This I have stressed more

than a decade ago in a chapter in my best seller **THE STRANGE DEATH OF FRANKLIN D. ROOSEVELT**, in the chapter entitled "The Moral Consequences Of The New Deal—Juvenile Delinquency".

The ugliest and most ironic aspect of this tragic and menacing situation is that these criminal conspirators and designed subverters of our children are compelling honest and loyal citizens to finance their plot. They and their foundations derive their status and power from the exemption from taxation which they have deluded, or defrauded, us into giving them. The honest taxpayer bears the entire cost of the conspiratorial plan for destroying our republic and perverting our children, through a double burden of taxation. We whom the conspirators label "peasants" are required to honestly meet our own tax burden; and dishonestly, are forced to bear the burden of taxes evaded by the conspirators and their fake and malevolent "philanthropies". It does not make our burden any lighter, or pleasanter to bear, to realize that it is the tax-exempt conspirators who are constantly demanding, and imposing on us, "peasants", added and newly contrived tax burdens.

It does not improve the situation to witness treason perpetrated by these so-called "philanthropists" with absolute immunity, as in the financing of the Institute of Pacific Relations, Amerasia, the support of the Richard Sorge spy ring in Japan in their successful efforts to get the Japanese to attack the U. S. at Pearl Harbor instead of attacking Russia as they had planned; or by their agent Alger Hiss at the United Nations organization conference at San Francisco, and numerous others. Nor does their use of criminal agents, such as the Maffistas, Hoffa and others, to regiment us "peasants" in labor unions to be taxed and looted for the right to earn a living that is supposedly guaranteed us by the Constitution and the Bill of Rights; in politics; and in the fields of "art" and "culture", as is so clearly revealed by the current investigations of the Government Operations Committee.

The torturing and distortion of law and Constitution by the legal agents of the conspirators whom they have planted on the benches of the Supreme Court and of the lesser courts, for the protection of malefactors as low as traitors, dope peddlers, rapists and Communists, also does not serve to give our children respect for the law or a laudable example to follow.

As a member of your Committee shrewdly pointed out, the solution of the problem of juvenile delinquency and crime lies in prevention rather than in cure. So long as our children see vice, corruption and crime flourish with

impunity and the perpetrators in both public and private life rewarded richly with fame, or notoriety which is accepted as such today, and with fortune, they would be lacking in intelligent self-interest if they fail to follow the example given them, from the viewpoint with which they are instilled by the conspirators in their "educational" brainwashing. Indeed, only a strong sense of ethics and morality, which their parents are virtually barred from instilling in them, and which "Progressive" educators shun, would deter them from "following the crowd", and turning to delinquency and crime. Sen. Henning sagely pointed out that the contempt of many of us for some of our laws and their administration (the parking ticket, he cited as an example) is certain to influence our offspring.

Thus far the conspirators have been quite successful in rigging their committees "investigating" juvenile delinquency to exculpate themselves and report, in the utterly false and trite shibboleth: "Juvenile delinquency arises from failure of parents to exercise discipline." It is hard to believe that the plotters do not have tongues in the cheeks when they make "whipping boys" of the impotent parents, and then turn around and advocate measures that will place a still greater tax burden on the parents so as to force them to keep their noses to their grindstones even more of the time and give them even less opportunity to see or discipline their children.

The first step in the solution of this problem is to destroy its basic causes: the criminal conspiracy that has brought us to the status quo; the tax-exempt status that supplies their fake "philanthropies" and other agencies with the spare wealth and power to carry on; and the impunity with which they and their criminal agents operate. This is your duty.

Above all else, if and when we honestly seek the cause and remedy of juvenile crime and delinquency, rather than an alibi for it, we must bear in mind that we have become a nation in which corruption and crime are rampant, in which smug hypocrisy lets us regard the perpetrators thereof and the gains derived therefrom with honor and respect—until and unless they are caught and convicted, and despoiled of their loot. Our schools teach that material gains and wealth, no matter how acquired, are the highest goal in life and entitled to admiration, respect and emulation.

We must bear in mind, also, that the militarism spelled by universal military training and draft, with its separation and isolation of the sexes, have invariably rotted the fibre of nations and fostered perversion and crime.

And let us also bear in mind that unless we resolve this situation, the conspirators will have succeeded in the plot. And that spells the end of our Republic and its Constitution, and the beginning of the dictatorship that they have plotted. This can already be discerned in our national regimentation into organizations, that are designed by the conspirators to put an end to the American concept of the dignity of the individual and substitute therefore their planned "mass man" who is the natural subject of dictators and Soviets of the type plotted. That is also what lies behind their campaign for "integration", or the "homogenization", of mankind for the purpose of reducing all to the lowest common denominator, preferably of savagery and imbecility. That is the significance of their fostering of gangs and "rumbles" among youngsters.

NEEDLESS IS IT TO RELATE THAT THIS EVIDENCE *WAS NOT PUBLISHED* IN THE "COMPLETE REPORT" OF THE VENAL SENATORIAL AGENTS & ACCOMPLICES OF THE CONSPIRATORS.

## Acknowledgments

The idea for this book grew out of my teaching about the political economy of health care. My students and I asked how the present system came to be. The search for answers led me to histories of medicine, published materials in journals of the period, and the archival files of the Rockefeller and Carnegie philanthropies. The archives provided a rich record of the thoughts, policies, and actions of some of the most influential persons in the history of American medicine.

The search culminated in this book. But the book would not have been possible without the generous help, enthusiastic interest, and personal support of many people. I am especially grateful to Howard Waitzkin, WilHam Kornhauser, Barbara Ehrenreich, Gert Brieger, and Michael Pincus, all of whom gave me detailed and thoughtful criticisms on major portions of the manuscript together with great encouragement. I also received helpful criticism and support from Anne Johnson, Jon Garfield, Charlene Harrington, Barbara Waterman, James O'Connor, Dan Feshbach, Ivan Ilich, David Horowitz, June Fisher, Kathryn Johnson, Jack London, Jane Grant, Tom Bodenheimer, Sara McIntire, Joe Selby, Larry Sirott, and Myrna Cozen. Howard Berliner has been an exceptional colleague, sharing ideas and material in a cooperative effort to understand these sparsely studied issues.

Marianne Parker Brown, my wife, gave me continuing encouragement and intellectual criticism and support, even when the burdens of family and household fell disproportionately on her shoulders. My daughters, Delia and Adrienne, were under-

## xii I Acknowledgments

standing beyond their years while their father was "working on his book."

The staffs of the Rockefeller Foundation Archives and the Rockefeller Family Archives (now combined in the Rockefeller Archive Center) and the Carnegie Foundation for the Advancement of Teaching were very helpful in providing convenient working facilities and making my research in New York excitingly productive. The staffs of the Health Sciences Information Service and the Library Delivery Service at the University of California saved me innumerable hours of retrieving books and journals from the far-flung libraries on the Berkeley campus.

Eva Scipio, Ruth McKeeter, and Sandra Golvin skillfully typed portions of the manuscript in its various phases.

Estelle Jelinek carefully and thoughtfully copy edited the final manuscript.

Much of the research for the last chapter was done while I was a consultant to the Childhood and Government Project at the University of California Law School. The Health and Medical Sciences Program, also at Berkeley, helped defray the costs of my research trip to the archives in New York.

The Rockefeller Archive Center and the Carnegie Foundation for the Advancement of Teaching kindly gave me permission to publish excerpts from their files.

## Introduction

The crisis in today's health care system is deeply rooted in the interwoven history of modern medicine and corporate capitalism. The major groups and forces that shaped the medical system sowed the seeds of the crisis we now face. The medical profession and other medical interest groups each tried to make medicine serve their own narrow economic and social interests. Foundations and other corporate class institutions insisted that medicine serve the needs of "their" corporate capitalist society. The dialectic of their common efforts and their clashes, and the economic and political forces set in motion by their actions, shaped the system as it grew. Out of this history emerged a medical system that poorly serves society's health needs.

The system's most obvious problems are the cost, inflation, and inaccessibility of medical care in the United States. Total health expenditures in this country topped \$200 billion in 1979, nearly \$1,000 for every woman, man, and child. Far more of society's resources now go into medical expenditures than ever before; twice the portion of the Gross National Product was spent on medical care in 1980 than in 1950.

We pay for these costs through our taxes, health insurance premiums, and directly out of our pockets. Public expenditures—four out of every ten dollars spent on personal health services—come out of our taxes. Private health insurance and direct out-of-pocket payments each account for about three out of every ten dollars. No matter what form it takes, the entire \$200 billion originates in the labor of men and women in the society. President Carter estimated that the average American worker

## 2 / Introduction

works one month each year just to pay the costs of the medical system.'

Most people feel they should be getting a lot for this money, but instead they find that it is difficult even to get the care they need. Primary care physicians—general practitioners, pediatricians, internists, and gynecologists—are scarce. Doctors and hospitals are clustered in the "better" parts of our cities and largely absent from the poorer sections and rural areas of our country. For the millions of Americans covered by Medicaid (the government subsidy program for the public assistance-linked poor), the coverage has been as sparse and degrading as the demeaning clinics it was supposed to replace. The middle class and the poor share at least long waiting periods for doctors, one of the most common constraints on the accessibility of physicians. Instead of creating a humane and accessible medical care system, Medicare and Medicaid have helped fuel inflation in medical costs by dumping new funds into a privately controlled system ready to absorb every penny into expansion, technology, high salaries, and profits.

A second, somewhat less widely discussed, problem is the relatively small impact medical care makes on the population's health status. Despite a plethora of new diagnostic procedures, drugs, and surgical techniques, we are not as healthy as we believed these medical wonders would make us. Some critics, like social philosopher Ivan Illich,<sup>1</sup> accuse medicine of making us sicker—physically, politically, and culturally—than we would be without it. Many analysts have documented the medical profession's social control functions, medical technology's frequently adverse effects on our health, and medicine's neglect of important physical and social environmental influences on our health.<sup>2</sup> Instead of medicine liberating us from the suffering and dependency of illness, we find that its oppressive elements have grown at least as rapidly as its technical achievements.

Why has medical care grown so costly so rapidly? Why is it so plentiful and yet so inaccessible? How did medicine become technically so sophisticated but remain socially unconcerned and even repressive?

A popular but too facile answer is that such problems are characteristic of technology and industrialized societies. According to this argument, technology and industrialization impose

## Introduction I 3

their own limits on forms of social organization and produce similar kinds of problems that call forth similar solutions. Medical sociologist David Mechanic finds problems of cost, organization, and ethical dilemmas in medicine widespread among industrialized countries and concludes that "the demands of medical technology and the growth of the science base of medical activity produce pressures toward common organizational solutions despite strong ideological differences."<sup>1</sup> Ilich asserts that "pathogenic medicine is the result of industrial overproduction."<sup>2</sup> In this view, technology has a life of its own, imposing its imperatives on individuals and social organization. By focusing on widespread patterns of industrial organization and technological development, these analysts conclude that technology and industrialization are universal determining forces.

Such technological determinism ignores the particular history in which society and technology interact. In the Marxian view, technology and economic organization constantly shape each other in a dialectical process. Individuals and groups who own the resources and control the organization of production, far from being at the mercy of "neutral" technology, introduce innovations that serve their own ends and oppose those that would serve other interests than their own. These innovations may neglect broader community needs and may hurt the interests of others. Machines and factories undermined the autonomy and even the economic existence of independent craft workers. Hospitals and their expensive equipment may tie many health workers to monotonous jobs and use funds that might otherwise go for more widely distributed community clinics. Those affected by these technological developments may resist them and force their modification. Workers may organize into unions and gain some control over the relations of production. Communities may organize to block hospital expansion and force development of more community-based clinics. In sum, the political-economic organization of society generates certain types of technological innovation and not others, and these innovations generate new social forces that modify technology and political-economic relations.<sup>3</sup>

This book sees scientific, technological medicine not as the determining force in the development of modern health care but as a tool developed by members of the medical profession and the

corporate class to serve their perceived needs. Individuals and groups who possess needed resources can apply them to develop certain types of technological innovation in medicine. Those who have the requisite resources can also apply the resulting technological innovation to serve their economic and social needs.

In the United States medicine came of age during the same period that corporations grew to dominate the larger economy. As corporate capitalism developed, it altered many institutions in the society, medicine among them. Its influence was created not simply through cultural assimilation or the demands of industrial organization but by persons who acted in its behalf. This interpretation does not suggest that history is made by dark conspiracies. Rather, it argues that the class that disproportionately owns, directs, and profits from the dominant economic system will disproportionately influence other spheres of social relations as well.

Members of the corporate class, including those who own substantial shares of corporate wealth as well as the top managers of major corporate institutions, naturally try to ensure the survival of capitalist society and their own positions in its social structure. In the case of medicine, members of the corporate class, acting mainly through philanthropic foundations, articulated a strategy for developing a medical system to meet the needs of capitalist society. They believed their goals for medicine would benefit the society as a whole, just as they believed that the private accumulation of wealth and private decisions about how to use that wealth and its income were in the best interests of society. In this book, we will examine the strategies they developed during the Progressive era and the reasons for their actions, leaning heavily on the public and private thoughts of some persons centrally involved in these efforts. We will describe and analyze the interests and strategies of the medical profession and of the corporate class as they developed independently, coalesced, and then clashed. We will also see that the government has increasingly taken over the strategies and struggles begun by the corporate class.

The corporate class influenced medicine, but it could not control it absolutely. The market system in medical care provides special interest groups—today including doctors, hospitals, insurance companies, drug companies, and medical supply and

## Introduction I 5

equipment companies—^with the opportunity to develop their own bases of economic power, enabling them to carve out and defend their turfs in the marketplace. The larger business class stands "above" these interest groups, trying to tame and coordinate the leviathan but nonetheless committed to private ownership and control and also enjoying medicine's legitimizing and cultural functions. The relationships and the contradictions that emerged among the corporate class and these medical interest groups profoundly influenced the organization and content of today's medical system.

## DOCTORS

From our vantage point today it is difficult to believe that in the late nineteenth century the medical profession lacked power, wealth, and status. Medicine at that time was pluralistic in its theories of disease, technically ineffective in preventing or curing sickness, and divided into several warring sects. Existing professional organizations had virtually no control over the entry of new doctors into the field. Physicians as a group were merely scattered members of the lower professional stratum, earning from several hundred to several thousand dollars a year and having no special status within the population.

By the 1930s, however, medicine was firmly in the hands of an organized profession that controlled entry into the field through licensure and accreditation of medical schools and teaching hospitals. The profession also controlled the practice and economics of medicine through local medical societies. "Medicine" had come to mean the field of clinical practice by graduates of schools that followed the scientific, clinical, and research orientations laid down by the American Medical Association (AMA) and by Abraham Flexner in a famous report for the Carnegie Foundation. All other healers were being excluded from practice. Physicians were increasingly drawn only from the middle and upper classes. The median net income for nonsalaried physicians in 1929 was \$3,758, above the average for college teachers but below the faculty at Yale University and below the average for mechanical engineers."^ Overall, doctors were rapidly rising in income, power, and status among all occupational groups.

In the 1970s physicians have continued to climb to the top

## 6 I Introduction

rungs of America's class structure. The" median net income of office-based physicians—\$63,000 in 1976—places them in the top few percentiles of society's income structure. In 1939 the average earnings of doctors were two and a half times as great as those of other full-time workers, but by 1976 the gap had increased to five and a half times. Doctors rank with Supreme Court justices at the top of the occupational status hierarchy. And in recent public opinion polls, more Americans said they trusted the medical profession than any other American institution—including higher education, government (of course), and organized religion.^

Rising "productivity" has been an important factor in physicians' efforts to raise their incomes, status, and power. The medical profession has drastically controlled the production of new physicians and has delegated to technicians and paraprofessionals below them the tasks they no longer find interesting or profitable. With rapidly expanding medical technology, more and more tasks were shifted down the line to a burgeoning health work force. At the beginning of this century two out of every three health workers were physicians. Of the more than 4.7 million health workers today, only one in twelve is a physician. Thus, doctors have increasingly become the managers of patient care rather than the direct providers of it.^

As medical managers, physicians have found themselves drawn out of private practice into employment in hospitals, research, teaching, government, and other institutions. Today four in ten doctors are employed in such institutions, compared with one in ten in 1931. These physicians have had fewer material interests in common with private practitioners and have shown little political support for the AMA.^°

Physicians entered a struggle to maintain their position at the top of the medical hierarchy soon after that position was won. The challenge has not, for the most part, come from below, except for recent attempts by nurses to increase their authority in patient care. Doctors have found themselves in a struggle with hospitals, insurance companies, medical schools, foundations, government health agencies, and other groups with an interest in a more rationalized health system—one in which the parts are more coordinated hierarchically and horizontally and in which more emphasis is given to capital-intensive services. The conflict has emerged between organized practitioners as one interest

group, what Robert Alford calls "professional monopolizers," and all the groups seeking to systematize health care according to bureaucratic and business principles of organization, what Alford calls "corporate rationalizers."

## OTHER INTEREST GROUPS

In challenging the power of organized medicine to protect its interests, hospitals, particularly through the American Hospital Association (AHA), have tried to appear the "logical center" of any rationalized health system.<sup>1</sup> In their transformation and growth from asylums for the sick and dying poor to their twentieth-century role as the physician's workshop, hospitals developed a powerful position in modern health care as the major locus of medical technology. Because of physicians' growing reliance on technology, hospitals were absorbing an increasing share of dollars spent on medical care. Public and private health insurance (really, medical care insurance) developed as a stable source of income, enabling hospitals to expand their facilities. Collectively, hospitals have become a major force in the medical system, consuming 40 percent of the nation's annual health care expenditures. Blue Cross and Blue Shield (the "Blues"), created in the 1930s and 1940s by hospital associations and medical societies, respectively, together with commercial insurance companies now control 30 percent of medical care expenditures, mostly emphasizing hospital-based technical care. They have developed economic and political clout commensurate with their dominating fiscal role.

While the insurance industry is a new voice in the chorus of corporate rationalizers, medical schools have been in the vanguard for more than half a century. Although run by physicians—for the reproduction of health professionals and as the research and development arm of the medical industry—medical school interests have often conflicted with the interests of practitioner-dominated medical societies. In the nineteenth century, medical schools were generally run by small groups of doctors for their own financial benefit. During most of the twentieth century, medical schools have been university-controlled and responsive to the interests of foundations and, since World War I, government funding sources. For the brief period from about

## 8 I Introduction

1900 to World War I, science-oriented medical schools and the AMA joined forces to press for the acceptance of scientific medicine. Since that time they have gone their separate ways—the AMA struggling to preserve the dominance and incomes of private practitioners, and medical schools fostering more rationalized medical care, usually with physicians as top management.

Hospitals, insurance companies, and medical schools all have a relatively greater interest than doctors in promoting capital-intensive, rationalized medical care. While expanding medical technology helped doctors increase their status and incomes, it has been the *raison d'être* of hospitals, medical schools, and even insurance companies. Medical technology's demands for heavy capital investment also encourage rationalization of medical resources—centralization and coordination of capital, facilities, expenditures, income, and personnel.

## FOUNDATIONS AND THE STATE

Besides these interest groups, two other forces—the government and foundations—have exerted a powerful influence in favor of rationalizing medical care. Although the government has been the dominant influence since World War II, foundations were the major external influence on American medicine in its formative period from 1900 to 1930. Their source of power has been the purse, generously but carefully applied to specific programs and policies. Neither foundations nor the government has operated as an interest group in the manner

of doctors, hospitals, insurance companies, medical schools, and the drug and hospital supply industries. The enormous sums they expended—from foundations some \$300 million from 1910 through the 1930s and from the federal government many billions of dollars since World War II, for medical research and education alone—have not been for their own financial enrichment.

The argument developed and supported in this book suggests that both foundation policy and government policy have served the interests of certain medical groups but only because the interests of these groups coincided with those of the larger corporate class. As evidence from the historical record will show, the programs of foundations earlier in this century were explicitly

## Introduction I 9

intended to develop and strengthen institutions that would extend the reach and tighten the grasp of capitalism throughout the society.

In medicine the major objectives of foundations were: to develop a system of medicine that would be supportive of capitalist society; and to rationalize medical care to make it accessible to those whom it was supposed to reach but at the least cost to society's resources. These objectives created their own contradictions. At first, foundations aligned themselves with the aims and strategies of the medical profession, but they soon rejected the narrow interests the profession wished to serve and moved quickly to expand the roles of medical schools and hospitals and to support their dominance over all medical care. By World War II, when the role of the State\* in governing the capitalist economy was fully established, the federal government took over the foundations' leading role in medicine, continuing the basic strategy adopted by the foundations more than two decades earlier and opening the floodgates of the treasury to implement it.

In the first chapter, we will see how philanthropic foundations emerged from several parallel developments of capitalist society in the latter nineteenth century. While many members of the new wealthy class were supporting charities to ameliorate the disruptions and deprivations imposed on large numbers of people by capitalist industrialization, others recognized the need for technically trained professionals and managers and supported the development of universities and professional science. Just after the turn of the century men of great wealth, like John D. Rockefeller and Andrew Carnegie, created philanthropic foundations with professional managers in charge of their charitable fortunes. With the Rockefeller philanthropies in the lead, these foundations developed strategic programs to legitimize the fundamental social structure of capitalist society and to provide for its technical needs.

Chapter 2 traces the social and economic role of scientific medicine in the history of the American medical profession.

\*Throughout this book, capitalized "State" refers to the political institutions and agencies of government which embody society's political authority. Uncapitalized "state" refers to the individual states in the United States.

## 10 I Introduction

Modern scientific medicine was not merely a "natural" outcome of combining science and medicine in the nineteenth century. Apart from the concrete scientific developments that permitted the application of scientific thought and investigation to problems of disease, scientific medicine had equally important social and economic origins. It was an essential part of a strategy articulated by reform leaders of the medical profession to enhance the profession's position in society, and it succeeded because it won the support of dominant segments of the American class structure.

Scientific medicine gained the support of the American medical profession in the late nineteenth century because it met the economic and social needs of physicians. By giving doctors greater technical credibility in society, it saved them from the ignominious position to which the profession had sunk. Moreover, scientific medicine became an ideological tool by which the dominant "regular" segment of the profession restricted the production of new doctors, overcame other medical sects, temporarily united leading medical school faculty and practitioners, and otherwise reduced competition.

Despite its appeal for the medical profession, scientific medicine would have accomplished little for doctors if it had not had the support of dominant groups in American society. In Chapter 3 we will see the reasons for this capitalist support, especially through the thinking of Frederick T. Gates, for more than two decades the chief philanthropic and financial lieutenant to John D. Rockefeller and the architect of the major Rockefeller medical philanthropies.

As an explanation of the causes, prevention, and cure of disease that was strikingly similar to the world view of industrial capitalism, scientific medicine won the support of the classes associated with the rise of corporate capitalism in America. Capitalists and corporate managers believed that scientific medicine would improve the health of society's work force and thereby increase productivity. They also embraced scientific medicine as an ideological weapon in their struggle to formulate a new culture appropriate to and supportive of industrial capitalism. They were drawn to the profession's formulation of medical theory and practice that exonerated capitalism's vast inequities and its reckless practices that shortened the lives of members of the

## Introduction I U

working class. Thus, scientific medicine served the interests of both the dominant medical profession and the corporate class in the United States.

Nevertheless, a contradiction emerged between the interests of the medical profession and those of the corporate class. As we will see in Chapter 4, the private practice profession and the corporate class clashed over attempts to reform medical education. The financing of scientific medical schools required tremendous amounts of capital from outside the medical profession. Those who provided the capital had the leverage to impose policy. The lines of the conflict were clearly drawn: Was medical education to be controlled by and to serve the needs of medical practitioners? Or was it to serve the broader needs of capitalist society and be controlled by corporate class institutions?

The Flexner report, sponsored by the Carnegie Foundation, tried to unify these interests by centering its attack on crassly commercial medical schools. However, the Rockefeller philanthropies, substantially directed by Gates, exposed the contradiction by forcing a full-time clinical faculty system on recipient schools against the interests and arguments of private practitioners. Gates made it clear that medicine must serve capitalist society and be controlled—through the medical schools that reproduce its professional personnel and innovate its technique—by capitalist foundations and capitalist universities. By 1929 one Rockefeller foundation, the General Education Board, had itself appropriated more than \$78 million to medical schools to implement this strategy, and Gates' perspective was firmly established.

Gates was adamant about keeping his strategy free of involvement with the State by not giving money to state university medical schools. However, within the Rockefeller philanthropies as within the largest industrial and financial corporations generally, most officers and directors had come to see the State as a necessary aid in rationalizing industries, markets, and institutions.

The course that Gates and his contemporaries initiated continued to develop during the next half-century, but with the State assuming the dominant financial and political role in rationalizing medical care and developing medical technology. As we will see in Chapter 5, the State's emphasis on technological

## 12 I Introduction

medicine ignored some of the most important determinants of disease and death while the economic and political forces of capitalist society assured that rationalization would not eliminate the developing corporate ownership and control over the medical market. How medicine will be contained and rationalized in this private market system is a contradiction that now plagues the State and the corporate class as the demand for national health insurance grows. How medical resources can be transformed into effective instruments for improving the population's health is a contradiction imposed on the entire society. These contradictions and their resulting crises are the legacy of medicine's development in capitalist society.

## CHAPTER

## "Wholesale Philanthropy ": From Charity to Social Transformation

Industrialization in nineteenth-century America created many problems for those who owned and managed the corporations that came to dominate the economy. Industrial capitalists had to arrange for adequate capital, obtain raw materials, organize production, discipline a reluctant work force, and develop markets and transportation systems. They also had to deal with the political structures and methods intended for older relations of production, centered around agriculture and commerce, that were only slowly adapting to the new industrial, corporate order. Finally, they had to reshape older social institutions or create new ones. Educational, religious, medical, and cultural institutions were some of the glue that held together the ancien regime. In sum, the new corporate class had to transform all these economic, political, and social institutions to serve their urbanized, industrialized, and corporate society.

The new economic order created different problems for classes that owned little or nothing of the new system. American society had never been tranquil, but industrialization spread deep disaffection and anger among classes who were dislocated by it and among those who suffered as a result of capitalist accumulation of wealth. The agrarian and merchant rulers of the formerly dominant towns resented the meteoric rise of urban industrialists and bankers. Native craftsmen, foreign immigrants, and dis-

### 14 I "Wholesale Philanthropy

possessed farmers reluctantly submitted to the factory system. Unionism, populism, and socialism threatened the power and wealth of corporations and even raised doubts about the continued existence of capitalism.

As we will see in this chapter, corporate capitalists turned to philanthropy, the universities, and then to medicine to solve some of the many problems that grew out of capitalist industrialization. For the most part, social transformations were led by the same "unseen hand" that guided the market forces of capitalism; this self-interest provided a limited perspective for social change. Only gradually did leading capitalists and their allies consciously develop broad strategies and supports for the new order they were building. Philanthropic capitalists supported often harsh but hopefully ameliorative charity to control the desperate poorer classes. Others began building universities to meet the new society's needs for trained experts and managers. A new managerial and professional stratum developed to direct corporations, universities, science, medical institutions, and philanthropy itself. After the turn of the century, some philanthropists transformed foundations into a truly corporate philanthropy,\* modeled after the dominant economic institutions and fueled with their "surplus" wealth. Representatives of the emerging corporate liberalism made these foundations their chief instruments for transforming social institutions, giving corporate philanthropy an historical role beyond the most visionary dreams of early philanthropic capitalists. This union of corporate philanthropy, the managerial-professional stratum, and the universities and science spawned the Rockefeller medicine men and their new system of medicine.

### CREATING PRIVATE FORTUNES AND SOCIAL DISCONTENT

The Civil War was a watershed in American philanthropy, as it was in nearly all aspects of American life. It was a great wrenching experience in American history, spreading death and destruction, stimulating industrial development, and producing

\*In this book, "corporate philanthropy" refers to philanthropy characteristic of corporate capitalism, especially foundations that are philanthropic corporations controlled by members of the corporate class.

### "Wholesale Philanthropy" I 15

upheavals within and between all classes of Americans. A new kind of philanthropy, tailored to these new conditions, emerged in the decades following the war.

The Civil War not only freed the black slaves from legal bonds of slavery. It also freed the hand of Northern capital to extend throughout the nation the industrial transformation it had begun mainly north of the Ohio River. As the "underground railroad" was the vehicle and symbol of freedom for ante-bellum slaves, the iron

railroad was the vehicle and symbol of industrialization and the ascending capitalist class.

As the railroads were used increasingly to move troops and supplies for the Union armies, they helped extend and integrate the marketplace, making possible a specialized manufacturing and marketing system that could be coordinated across the continent. The railroads pushed into every region of the country. They brought farm produce to new markets and to ports for shipment to distant lands. They carried cotton from Southern fields to New England textile mills. They carried iron ore from Lake Superior to the iron mills and new Bessemer steel furnaces in Pittsburgh, and oil from western Pennsylvania to Cleveland refineries. And they brought the products from the nation's factories to markets in every region. Everywhere, they spread new settlements and development. Despite interruptions during the Civil War, railroad construction added 62,000 miles of new lines in the 1860s and 1870s, tripling the nation's existing track mileage. Railroad construction required iron and later steel rails and bridges. The railroads themselves soon became the biggest customers of America's growing steel industry.

The Civil War and the railroads led some men to their pots of gold. Andrew Carnegie began his rise to fortune as a telegraph clerk for the Pennsylvania Railroad in 1853. By the beginning of the Civil War the ambitious twenty-five-year-old Carnegie was well into railroad management and spent a few months organizing rail transport and telegraph communications for the War Department. But Carnegie quit his exciting and dangerous war front job and returned to the Pennsy and especially to tend his growing investment in iron manufacturing and coal mining. By 1863 his annual income exceeded \$40,000.<sup>16</sup>

John Davison Rockefeller's fortunes were also helped by the Civil War. In 1861, as the war consumed the energies and lives of

#### 16 I "Wholesale Philanthropy"

Northerners and Southerners, the twenty-five-year-old Rockefeller was building a successful merchandising firm in Cleveland. As war orders poured in, commodity prices rose sharply, and Rockefeller's profits soared. Two years later, Rockefeller had saved enough capital to invest in an oil refining business, and by the end of the war he was worth enough to take control of the company. By 1880, led by Rockefeller's determination to "make money and still more money," combined with relentless competition in the marketplace and rebates extracted from the railroads, his Standard Oil Company was refining 95 percent of the country's oil.<sup>17</sup>

While the industrial base had obviously been growing in the decades before the Civil War, it was the changes wrought by the war that cemented the new system's structure. The Southern patrician class, whose position was based on agriculture and slaves, was not crushed, but its subordination to the Northern-controlled capitalist economy was assured. The factory system was extended with the railroad, and an industrial working class was formed out of craftsmen and laborers, native folk and immigrants. Small-town America gradually gave way to industrial and commercial boom, and cities grew faster than their fragile tenements could be built. In the process, the older entrepreneurs and landed gentry were displaced by the new entrepreneurs and their corporations. By the 1870s, for example, only 520, or 5 percent, of the 10,395 businesses in Massachusetts were incorporated. But this 5 percent held 96 percent of the total capital and employed 60 percent of all workers. By 1900 three-fourths of all manufactured goods were produced by corporations. Because of the important logistical role of the railroads, the Civil War has been called the "first railroad war." Yet the war did not rely on an industrial economy. As William Appleman Williams aptly put it, the Civil War "produced an industrial system rather than being fought with one."<sup>18</sup> The ultimate victors of the war were the corporations and the men who, for the most part, ruled the new economy.

Not all was smooth for the new barons of the corporate economy, nor did they make life easy for those under them. The owners of each industry, driven to grab what they could of the available market and accumulate as much capital as possible in the shortest time, pushed wages down in order to lower prices

#### "Wholesale Philanthropy" I 17

and to get a jump on their competitors. Immigrants were inducted into the growing industrial work force. Some

16 million foreign-born were attracted to the country in the second half of the nineteenth century, totaling 15 percent of the population by 1890 and nearly a quarter of the population of the industrialized northeastern states. Craftsmen saw their skills, the basis of modest security and pride, fall to degradation and unemployment before machines that outproduced them and factories that oppressed them. Migrants from failing farms and immigrants from foreign lands filled the factories and cities of the New World. Working men lost their livelihoods or submitted to the harshest labors. Women were drawn out of more traditional homebound work into factories, shops, and stores. Twenty percent of the nation's women were wage laborers by 1900. Children were sucked into the factories as the cheapest labor. Working-class family and social life were shaken and devastated.

Exploitation of workers, unmitigated by either legal restraints or humanitarianism, led to increased organizing by labor. The depression of the 1870s brought wages in 1875 down to \$1.50 for a ten-hour day. Riots were common in cities throughout the country. Labor began to organize, and employers used every available power, from lockouts to Pinkertons, to crush the union movement. In 1877 the first nationwide strike, a spreading walkout against the railroads, was put down with a bloodbath that took the lives of scores of workers, their families, and their supporters in city slums around the country. The labor movement grew and strikes continued to spread in the 1880s and 1890s. The Haymarket Square bomb in 1886, the strike at Carnegie's Homestead steel mills in 1892, and the Pullman strike in 1894 were only the most prominent events that made employers and their allies fear for the continued existence of their society. "The times are strangely out of joint," worried a Kentucky politician. "The rich grow richer, the poor become poorer; the nation trembles."\*

Town folk and farmers, especially in the Midwest and South, felt their lives and livelihoods increasingly determined by railroad rates and lines of credit from banks directed from distant cities. Semi-feudal sharecropping kept large numbers of Southern farmers in perpetual debt and poverty. Agrarian opposition to capitalist expansion won broad support. In 1896 the growing

## J8 I 'Wholesale Philanthropy'

Populist party formed a shallow coalition with the Democratic party around the Democrat Bryan for President and the Populist Tom Watson for Vice-President against McKinley, the candidate of big business. The Populist party was decimated by their defeat, but populist resistance to capitalist wealth and control of agriculture continued in the Granges and the Farmers Union well into the new century. To the middle-class professionals who dominated the Progressive movement the society seemed to be breaking up below them because of the greed of those above them. They called for reforms to limit the concentration of power and wealth. Many members of the richer class felt called upon to justify the great inequality that angered the working class and worried the middle class. Naturally they did not see themselves as "idle" rich. They viewed their efforts to build industrial empires as productive work, and they considered all the people to be the beneficiaries of those empires. No one said it as well as Rockefeller:

The best philanthropy, the help that does the most good and the least harm, the help that nourishes civilization at its very root, that most widely disseminates health, righteousness, and happiness, is not what is usually called charity. It is, in my judgment, the investment of effort or time or money, carefully considered with relation to the power of employing people at a remunerative wage, to expand and develop the resources at hand, and to give opportunity for progress and healthful labour where it did not exist before. No mere money-giving is comparable to this in its lasting and beneficial results.^

The great benefit of such enterprises is moral, providing employment to otherwise idle hands, and material, "to multiply, to cheapen, and to diffuse as universally as possible the comforts of life."^ Thus, the building up of private industry is the best method of solving the problems that historically grew with industrialization. "Can there be any doubt that cheapening the cost of necessities and conveniences of life is the most powerful agent of civilization and progress?" asked Charles Elliott Perkins, president of the Chicago, Burlington, and Quincy Railroad. "The true gospel," Perkins philosophized agreeably, "is to enable men to acquire the comforts and conveniences of life by their own efforts, and then they will be wise and good.""

The class of men and women who provided this largess for the rest of society had varied notions about what to

do with their

## "Wholesale Philanthropy" I 19

money and their power. Mark Hanna, a Cleveland industrialist, showed fellow capitalists that the President and executive branch of the government, as well as the Congress, could be secured "for the protection of our business interests." Fearing the growing ranks of Populists and their increasing political strength, he established an interlocking political directorate of corporate leaders to organize their common interests and bring their influence more directly into the federal government. With their first Presidential triumph, electing McKinley in 1896, they inaugurated the modern system of expensive, centrally coordinated national campaigns. Hanna led the formation of a corporate politics that placed the broad class interests of industrialists and financiers ahead of "pork barrel" tactics favoring narrow interests that had dominated state, national, and local political scenes. Hanna and other leaders of this class put together new alliances, like the National Civic Federation, with some labor leaders to create a "harmony of interests" out of the class conflicts that threatened the new economic order. The Progressive movement proved an ideal vehicle for the business class to assert its interests by securing additional, needed capital from the Congress and, through reforms in the federal executive branch, creating and controlling regulatory agencies to bring order and consolidation to a number of industries. The politically wise leaders of this class thus demonstrated that with strategic alliances with social reformers and conservative union officials, the nation's political institutions could be reformed to serve the needs of the corporate order. ^

Not all capitalists, however, could see farther than their own immediate interests in politics. John D. Rockefeller, whose Standard Oil Trust was accused by Henry Demarest Lloyd of buying out the legislatures and the executive branches of Pennsylvania and Ohio, was unenthusiastic about his friend Hanna's broader political strategy. Hanna's first major success sent John Sherman to the U.S. Senate in 1885, ironically providing the author of the very law under which the Standard empire was eventually broken up. Perhaps Rockefeller suspected such betrayals from politicians who had their own visions of what was good for business, for he customarily reserved his political contributions for candidates closer to the Standard's immediate fields of operations. ^

Many wealthy men spent their fortunes on ostentatious luxury

## 20 I "Wholesale Philanthropy"

that left much of the European aristocracy in shadow. The Vanderbilts, Jim Fisk, Jay Gould, and other financiers built palaces along New York's Fifth Avenue, many of them with marble, furnishings, and statuary scooped up from the crumbling baronies of the Old World. Marshall Field and Potter Palmer built their castles on some of Chicago's most prized residential and lakefront land. Mark Hopkins, Charles Crocker, and Leland Stanford transformed San Francisco's Nob Hill with their residences of splendor, using wealth obtained from promoting and governing the westward expansion of the railroads. Carnegie bought himself a castle in his Scottish homeland. And Rockefeller created, not merely a castle, but a royal estate at Pocantico Hills, whose 3,500 acres overlooking the Hudson River was five times the size of Central Park. The spectacle of such living, especially in the midst of tenement-teeming cities, caused considerable agitation. The Massachusetts Board of Education had complained even in 1849, "One gorgeous palace absorbs all the labor and expense that might have made a thousand hovels comfortable." By the end of the century, social scientists cultivated by the wealthy came to their benefactors' defense. A Boston University economics professor retorted to detractors of grandeur, "The notion there is necessarily any causal connection between opulence and poverty is too crude to require serious refutation." ^°

## DRIVING THE RELUCTANT POOR FROM POVERTY

Some representatives of the opulent class, both before and after the Civil War, had a broader sense of purpose. They provided luxurious, even princely lives for themselves and their families, but they carefully set aside a share of their wealth for philanthropy. Philanthropy, of course, did not mean giving money directly to the poor. While charity had always implied providing alms for the relief of the poor, the rich and most social reformers in

the class immediately below the rich have always been wary of the consequences of giving to the poor. Cotton Mather urged colonial Boston merchants to set a disciplined, moral example and give only to the "poor that can't work." Benjamin Franklin hoped to provide sufficient opportunity in society so there would be no need of poverty, and he tried to

## "Wholesale Philanthropy" I 21

develop a strategy for getting the poor to adopt disciplined ways of living. "I think the best way of doing good to the poor," Franklin said, "is not making them easy in poverty, but leading them or driving them out of it."^^

Franklin's maxim and a pitiless Social Darwinist perspective were the heart of the charity organization movement that blossomed in the United States during the last three decades of the century. Patterned after the London Charity Organization Society, founded in 1869, these city and national organizations gave few handouts. Their main purpose was, in the words of a Philadelphia group, to develop "a method by which idleness and begging, now so encouraged, may be suppressed and worthy self-respecting poverty be discovered and relieved at the smallest cost to the benevolent." Even during the vast depression that began in 1873 and lasted until the end of that decade, all takers of charity were suspected of slothfulness and degeneracy. ^^

The poor were a desperate, volatile lot, given to crime, riots, and insolent discontent. Extreme Social Darwinists believed with Herbert Spencer that those who are fit to live do so and those who are not fit die—"and it is best they should die."^ But the dominant classes of any society need a more positive program than that to deal with oppressed classes' articulated demands for sharing the wealth or even their inarticulate mayhem.

The programs that emerged from charity organization work brought systematic study and the label of "science" to philanthropic work. The annual meetings of the National Conference of Charities and Correction brought together experts from charity organizations, administrators of penal institutions, hospitals and settlement houses, academics from university sociology and economics departments, and clergymen and physicians to coordinate their work and develop strategies for uplifting the poor. The attitudes of these "scientific" charity workers ran from harsh to refined, punitive to ameliorative."\* Over the years these reformers turned increasingly to the analytic methods of the social sciences and to the political views of the Progressive movement. Edward T. Devine, in his presidential address to the National Conference in 1906, noted that inmates were entering charitable institutions, insane asylums, prisons, and reformatories "faster than all our educational processes, our relief funds, and even our consecrated personal service" have been able to rehabilitate

## 22 I "Wholesale Philanthropy"

them. The role of "modern philanthropy," Devine continued, is to "seek out and to strike effectively at those organized forces of evil, at those particular causes of dependence and intolerable living conditions which are beyond the control of the individuals whom they injure and whom they too often destroy."^^

Scientific philanthropy must concern itself with "prevention rather than relief," argued Amos Warner, a Stanford economist active in the movement. Warner compared statistics compiled by charity organizations in the United States and Europe and concluded that nearly three-fourths of all poverty is due to personal or social "misfortune" and less than a fourth to "misconduct" on the part of the individual.^ "Prevention" involved intervening in the lives of both groups to assist them through their misfortune or change their bad habits and lead them onto the path of righteousness.

Out of this social intervention perspective and the charity organization movement emerged the social work professions. Case workers, settlement house workers, correctional administrators, probation officers, and their academic advisers shared with the middle and upper classes the prevailing Social Darwinist view that dependent poverty, crime, and social deviance in general had biological roots. But this new professional class believed that medical and social intervention could remedy "natural" imperfections."^

Given the disintegration of older social relations and the increasing fear of working-class revolt—both products of capitalist industrialization—it is not surprising that wealthy men and women supported the goals and

programs of the charity organizations and the social work movement. Charles Hull, who amassed a fortune from Chicago's booming real estate market, gave freely to social rehabilitation programs in the slums and sold cheap land to the poor to give them a stake in the existing society. It was his way of correcting the unequal distribution of land out of which he feared "discontent and revolution will come."<sup>^</sup>

Scorning pity and indiscriminate relief as merely reinforcing the poor in their degraded condition, the charity organization movement, social work professions, and wealthy benefactors in general worked instead to uplift, or rehabilitate the poor. They established institutions that would isolate "the poor that can't work" and prevent them from infecting "honest," hard-working

## "Wholesale Philanthropy" I 23

poor folk. They also developed programs to give the working poor a loftier vision of life than could otherwise be gotten from the factories and tenements in which they spent their lives. Settlement houses and social workers were established in the slums and ghettos to integrate the foreign-born into American society and to rehabilitate and reintegrate the casualties of an industrial society divided into owners and nonowners. Jane Addams' settlement house, provided by Charles Hull's estate, attempted to fulfill her principal goals to "feed the mind of the worker, to lift it above the monotony of his task, and to connect it with the larger world outside of his immediate surroundings. ..." Addams opposed the excesses of both capital and labor and worked to bring together these warring classes through programs acceptable to both.'<sup>^</sup>

Such programs did not suggest that the capitalist social structure itself should be altered. Rather they were intended to ameliorate the harsh conditions of capitalism by helping individuals escape from its pits and lead both useful and more satisfying lives. While many social workers supported union demands, their work won financial and political support from the wealthy classes because it diverted attention from more militant demands. Social workers held out the hope of ameliorating living conditions with social programs while workers demanded union recognition, higher pay, the eight-hour day, and relief from unemployment. All these programs proved more symbolic and ideological than actually ameliorative. The working poor and the unemployed were being taught to blame their own inadequacies for their conditions and to work and wait patiently for their individual rewards.

Some capitalists, however, both before and after the Civil War, were less concerned with revolt brewing below them or were more thoughtful about the future needs of their social system. They developed another line of philanthropy that centered on creating social institutions whose main functions were not even symbolic amelioration but provided for the training of personnel needed by industrial capitalism if it was to survive and grow. Some of these capitalists, particularly in the first half of the nineteenth century, helped to create compulsory public schools to socialize working-class and poor children to the rhythms and cooperative needs of factory work and to give

## 24 I "Wholesale Philanthropy"

them the rudimentary skills—reading, writing, arithmetic, and vocational skills—needed in an industrial society.<sup>^°</sup> Other men and women of wealth understood the country's need for more advanced technical skills. They joined forces with foresighted leaders of the nation's traditional colleges, bringing them out of the orbit of the old agricultural and merchant ruling class and into the service of the ascending industrial and financial order.

## TRAINING SCIENTIFIC HEADS TO DIRECT AMERICA'S "HARD HANDS"

On the last day of April in 1846 Edward Everett, the new president of Harvard University, stood before his faculty, students, and alumni and inaugurated a new era of cooperation between industrialists and America's colleges and universities. Harvard would no longer be geared mainly to the needs of the agricultural gentry and wealthy merchants, producing educated clergy, lawyers, and assorted gentlemen. Everett laid before his inaugural convocation a proposal, that Harvard found a "school of theoretical and practical science" to teach "its application to the arts of life," to furnish a "supply of skillful engineers" and other persons who would explore

and develop the "inexhaustible natural treasures of the country, and to guide its vast industrial energies in their rapid development."^^

Within a year Abbott Lawrence agreed to underwrite Everett's plans. Lawrence's investments in textile manufacturing and railroad financing had made him a man of wealth and influence in Massachusetts. The industrial revolution in America was in its infancy when he began, but now near midcentury its potential was proven. Lawrence knew first hand the value of the factory system and mechanization in increasing production and profits. He saw that railroad construction brought not only profits on his investment; it also created a demand for iron production and opened up regional and national markets, allowing farmers and factory owners to ship their products to distant markets and increasing America's exports. "Hard hands are ready to work upon our hard materials," he observed. But "where shall sagacious heads be taught to direct those hands?"^^

To answer his own question and help Harvard realize its self-appointed role, Lawrence gave the university the then

"Wholesale Philanthropy" I 25

princely sum of \$50,000 to found a school that would apply chemistry and other sciences to the needs of agriculture, engineering, mining and metallurgy, and the "invention and manufacture of machinery." Thus was the Lawrence Scientific School born. Lawrence was so pleased with the new school that he bequeathed an additional \$50,000 for it which Harvard received upon his death in 1855.

Harvard's school was exemplary of the new relationship between science, education, and industrialization. In the nineteenth century, scientists, industrialists, and college presidents developed a profitable alliance. The usefulness of science to industry, the willingness of industrialists to support scientific research, and the opportunity for colleges to train scientists and engineers and do much of the research needed by industry provided a great deal of common ground. It also opened the door for scientists who wanted to make science a full-time occupation and distinguish themselves from others who used the knowledge and methods of the natural sciences in their work.

The great inventors of the early industrial revolution were mostly practical-minded mechanics, craftsmen, and tinkerers, men and women whose lives embraced science through their work. "In contrast with modern practice," observes Harry Braverman, "science did not systematically lead the way for industry, but often lagged behind and grew out of the industrial arts."" By the 1830s and 1840s a new group of scientists emerged who wanted to be more than "dilettantes." Like their European counterparts, whose support and status they envied, the upper ranks of American scientists wanted to devote themselves to research, but they lacked the necessary financial resources. Although young men in America's colleges were taught science, there was almost no original research being done in the country. As Joseph Henry, the nation's leading physicist, complained, "every man who can burn phosphorous in oxygen and exhibit a few experiments to a class of young ladies is called a man of science."^"\*

In 1844 Alexander Dallas Bache, the superintendent of the U.S. Coast Survey, told an attentive audience at the country's first national scientific congress that America's unoriginal and meager science merely aped European science. America's science, he said, had inadequate institutional support, substituted

26 I "Wholesale Philanthropy'

teaching for scientific research, was overrun with gentleman scientists, and lacked professional scientists. Bache and Henry, together with Harvard mathematician Benjamin Peirce, astronomer Benjamin Gould, chemist Oliver Wolcott Gibbs, zoologist Louis Agassiz, and a few other professional scientists fancied themselves the nation's sole custodians of science and its development. They aggressively sought support for their research and promoted the cause of professional science. In their view, only some men were endowed with scientific talent, and only such an elite should be entrusted with training, facilities for research, and money. As Howard Miller has pointed out, their elitism won them no support from the assertive, democratic populists of Andrew Jackson's era."

These new men of science won increasing support from the entrepreneurial fortunes of the captains of industry. Lawrence was neither the first nor the last capitalist of the nineteenth century to channel his surplus wealth to colleges in order to put science at the service of industry. In 1846, with the financial help of philanthropists, Yale created two new professorships in agricultural and practical chemistry and appointed the eminent Benjamin Silliman, Jr., to one of them to develop and teach the "application of chemistry, and the kindred sciences to the manufacturing arts, to exploration of the resources of the country and to other practical uses." Silliman's prolific accomplishments at Yale included developing the first commercially successful method of refining petroleum. Before the Civil War, Joseph Earl Sheffield, a New Haven man who made his fortune in Southern cotton and in financing Northern railroads and canals, gave the struggling Yale Scientific School a large contribution. The university appreciatively renamed the school in honor of its benefactor, whose contributions to Yale for applied science totaled more than \$1 million by the time of his death in 1882.<sup>^\*</sup>

Perhaps the most symbolic change was the conversion of the Reverend Nathan Lord, president of Dartmouth College. As he assumed the college presidency in 1828, Lord asserted that Dartmouth was not designed for men who were to "engage in mercantile, mechanical, or agricultural operations." His strict adherence to the classics and to preparing gentlemen, however, did not survive several large contributions from wealthy advocates of applied sciences and engineering. By the late 1860s Lord

"Wholesale Philanthropy" I 27

eagerly embraced the "necessity now becoming constantly more evident of a higher education in the 'practical and useful arts of life.' "<sup>^</sup>

Some industrialists and finance capitalists, not content with the slow and incomplete transformations of the older colleges, started their own engineering schools. In 1824 Stephen Van Rensselaer, a wealthy landlord farmer who organized and backed the construction of the Erie Canal and thereby experienced for himself the lack of adequately trained engineers, founded the institute that bears his name to teach the "application of experimental chemistry, philosophy and natural history, to agriculture, domestic economy, the arts and manufactures."<sup>^\*</sup> Other engineering and technical schools were begun around the country from fonts of industrial wealth—Cooper Union in New York City, the Massachusetts Institute of Technology, the Stevens Institute in Hoboken, the Case School of Applied Science in Cleveland, the Pratt Institute in New York, and the California Institute of Technology, to name a few.

Philanthropic capitalists left their marks in American higher education in other areas besides science. Joseph Wharton, a wealthy manufacturer of metals, gave the University of Pennsylvania some \$600,000 for a school of finance and commerce that would train the managers, accountants, and leaders of industry who would direct the engineers and applied scientists graduating from technical schools. Entirely new universities were founded in the 1870s and 1880s by some of the wealthiest men and women in the country—<sup>^</sup>Johns Hopkins, Tulane, Clark, Vanderbilt, Stanford, Cornell, and others.

These educational philanthropists were primarily capitalists who disdained the aristocratic pretenses of gentleman farmers and the dabblers' and merchants' ignorance of technique. Remembering their own lack of preparation as they began their careers, they favored practical educations that would promote endeavors like theirs and create a fertile ground from which their new society would grow. They also perceived a need for trained personnel for the growing industrial and corporate economy. As the organizers of factories and other enterprises that employed increasing divisions of labor, they preferred to train technically skilled managers and reduce the skill levels of their laborers; in the words of Abbott Lawrence, let the "hard hands" do the labor

28 I "Wholesale Philanthropy"

and let "sagacious heads" design and direct the labor process. Impressed with the utility of applied science, they subsidized teaching and research in the natural sciences and engineering, and they supported vocational and applied curricula in colleges against the prevailing classical education. By the end of the century they were delighted with the progress that had been made in creating universities and colleges in their own image. And, of course, they were glad to have combined this self-interest with an appearance of generosity and altruism.

The entrepreneurial scientists and college presidents made the philanthropists' job an easy one. The development of modern universities and the founding of professional science in the United States were largely the products of elite college presidents and men of science inviting captains of industry to recognize the importance of their contributions to the nascent industrial and corporate society. They asked for and got money for their work, their institutions, and themselves.

Scientists offered their talents and their services to the capitalists in return for new laboratories and stipends; they gave up to the colleges a degree of autonomy in return for a legitimized base of operations, some financial security, and a protected role in training new basic and applied scientists as well as conducting research. College presidents acted as brokers, eagerly offering their services and institutions to capitalists and scientists alike, in return for new areas of service that would assure the continued relevance and financial security of their institutions under the ascending economic order. Their new buildings and endowments assured them that they were on the right track. By 1872 philanthropy accounted for nearly half the \$13 million income received by all the nation's institutions of higher education.<sup>29</sup>

The founding of schools, institutes, and universities was quite a different tack from giving to charity organization societies and creating settlement houses. They were both intended to meet the needs of the developing industrial and corporate society, but in different ways. One was ameliorative: It tried to compensate for the failings of the capitalist social structure. The other was more technical and "preventive": Institutions were developed to meet the needs of the system for technical expertise and industrial and social management. Both were important to the survival and expansion of industry as it was organized in capitalist society.

## "Wholesale Philanthropy" I 29

There were limitations, however, in the resources and strategies of both approaches. The social work approach was ameliorative at a time when most philanthropists were pressing for preventive strategies. The founding of universities and institutes, which had a preventive character, was limited in two ways. First, it often represented an individual action on the part of a particular rich man or woman who founded the institution to reflect a personal perspective of what was needed. While some of them secured the help of visionary university presidents, these institutions often reflected too strongly the personalities and idiosyncratic views of their founders. Only when governance fell to the institution's trustees did it come to reflect a broader perspective within the benefactor's class. Thus, the trustees who implemented Johns Hopkins' bequest for the founding of a university were able to do what they collectively believed worthwhile because their broad charter left them free of detailed instructions from the deceased benefactor while the endowment meant they had "no need of obeying the injunctions of any legislature, the beliefs of any religious body, or the clamors of any press."<sup>30</sup> Most benefactors, especially those who founded their institutions while on this side of their graves, held closer reins on policies and personnel.

The second limitation on the usefulness of the university movement among the wealthy was one of scale. Most of the founders had fortunes big enough to create only one institution, and those who had the wealth to do more nevertheless concentrated their energies and their money in one place. Thus their direct influence would come from only one place, and their indirect influence would be only as a model. These were often powerful forces. Van Rensselaer's institute claimed, by the middle of the nineteenth century, that it had produced a majority of the country's engineers and naturalists. And the class of wealthy university founders was small and often influenced each other: Ezra Cornell's new university at Ithaca was admired by Leland Stanford, and Stanford's creation in California greatly impressed Jonas Clark and his plans for Massachusetts.<sup>31</sup> These exceptions notwithstanding, the general limitations of individualism and narrowness of resources reduced the utility of university building for corporate capitalism.

The accolades these "good works" generated didn't mean that

## 30 I "Wholesale Philanthropy"

philanthropy could not be done better. And certainly the capitalist impulse to believe in perfectability in the organization of any enterprise encouraged many philanthropists to look for errors and seek a better way. The

obvious constraints of ameliorative social intervention programs drew most of the criticism. But while the create-a-school movement was not criticized explicitly, a successor was soon seen on the horizon. At best the universities were productive models of capitalist rationality and technical modernness in an untamed, competitive marketplace of seemingly incompetent educational institutions. Not surprisingly, it was the philanthropies created by the kings of oil and steel that started American schooling down the same road to vertical organization and centralized control that they had created in their own industries.

## CARNEGIE'S "GOSPEL OF WEALTH"

The growing fortunes of the Carnegies and Rockefellers in this country made them prominent symbols of the success as well as the inequities of industrial capitalism. It was this weighty responsibility that led Andrew Carnegie to explain the problems associated with great wealth and to lay out the responsibilities that came with its possession. In an influential two-part essay entitled "Wealth," published in the *North American Review* in 1889,<sup>^^</sup> Carnegie with a flush of confidence set out a plan for assuring continued private accumulation of wealth. "The problem of our age," he boldly began, "is the proper administration of wealth, that the ties of brotherhood may still bind together the rich and poor in harmonious relationship." Speaking to a receptive audience among the "haves" more than to the truculent "have-nots," Carnegie identified the accumulation of wealth as the essential factor in the "progress of the race." Whether it be "for good or ill, it is upon us, beyond our power to alter, and, therefore, to be accepted and made the best of. It is a waste of time to criticize the inevitable," he reassuringly added.

Though capitalism's "law" of competition "may be sometimes hard for the individual, it is best for the race because it insures the survival of the fittest in every department," he observed, paraphrasing the then widely idolized Herbert Spencer. Furthermore, it produced great material wealth so that all people lived better for it. Society must not only accept; it must welcome "great

## "Wholesale Philanthropy" I 31

inequality of environment," specifically the "concentration of business, industrial and commercial, in the hands of a few." It is not to be regretted that capitalists must "soon be in receipt of more revenues than can be judiciously expended upon themselves." It is simply incumbent upon the wealthy to dispose of their fortunes wisely.

They should not, he warned, leave the bulk of their wealth to their families, for such legacies undermine the moral integrity of the recipients. Nor should the rich man simply bequeath his fortune for public purposes because it is morally reprehensible to accumulate great wealth and not show either the interest or the judgment to spend it wisely. As exciting as Carnegie found his money-making career, it had always seemed to him below the moral and intellectual world to which he aspired. More than two decades before his declarations on wealth, Carnegie had written a memo to himself promising to quit business shortly: "To continue much longer overwhelmed by business cares and with most of my thought wholly upon the way to make more money in the shortest time, must degrade me beyond hope of permanent recovery." Now Carnegie admonished his peers, "The man who dies thus rich dies disgraced."

It is the duty of the wealthy, Carnegie declared in his article, "to consider all surplus revenues which come to him simply as trust funds," to do what, "in his judgment," is best for the community. The wealthy capitalist is thus a "mere trustee and agent for his poorer brethren, bringing to their service his superior wisdom, experience, and ability to administer"—in a word, "doing for them better than they would or could do for themselves."

He then recommended to men and women of substantial means seven uses for their surplus wealth, declaring the priorities that he followed in the years to come. Topping the list were universities, to which Carnegie gave more than \$20 million in his lifetime. Next were free public libraries, which, to Carnegie's mind, squared with his goal "to stimulate the best and most aspiring poor of the community to further efforts for their own improvement." Carnegie contributed 2,811 libraries to communities that promised to support them; this most famous of his philanthropies consumed more than \$60 million of his wealth. Carnegie also recommended

giving money for medical institutions, public parks and city beautification, halls for "concerts of

## 32 I "Wholesale Philanthropy

elevating music" and enlightening lectures, swimming baths, and—last—church buildings.^^

Carnegie's round face glowed and his eyes sparkled as he received the adulation of wealthy admirers and fawning supplicants. Gladstone sanctified Carnegie's proposals with a review of his article in the prestigious British magazine *Nineteenth Century*, criticizing only Carnegie's condemnation of inherited wealth. From his celebrated position, Carnegie dismissed the critical reviews of his article. The Reverend Hugh Price Hughes, a prominent Methodist minister and Christian populist, condemned this new "Gospel of Wealth," as it had come to be called. "Mr. Carnegie's 'progress' is accompanied by the growing 'poverty' of his less fortunate fellow-countrymen," he wrote. William Jewett Tucker, a Ueberal theologian and later president of Dartmouth College, pointed out that the assumption "that wealth is the inevitable possession of the few, and is best administered by them for the many, begs the whole question of economic justice now before society." "I can conceive of no greater mistake," Tucker protested, "than that of trying to make charity do the work of justice."^^

Carnegie's giving never aimed at justice; his goal was "to lead people upward." Like his politics, Carnegie's philanthropy was a mixture of moralistic programs to civilize the masses, impulsive decisions, and sentimentalism. Libraries, institutes, concert halls, and church organs—7,689 organs costing more than \$6 million—were given to uplift the poor and working classes. In 1904 he provided more than \$10 million for the Carnegie Hero Fund to honor men and women who are injured or killed while trying to save their fellows; medals were presented to the hero, or his or her surviving family, and occasionally monetary grants, to encourage the masses to follow examples set by "the heroes of civilization." Carnegie also provided his birthplace of Dunfermline, Scotland, with a \$3.75 million fund for parks, recreation, and general beautification.^^

## REVEREND GATES INTRODUCES ROCKEFELLER TO "WHOLESALE PHILANTHROPY"

Like Carnegie, John Davison Rockefeller's interest in financial benevolence antedates his most famous philanthropies. From the time of his youth. Rockefeller's life consisted of work, family,

## "Wholesale Philanthropy" I 33

and the Baptist church. More like his pious mother than his genial and impulsive father, Rockefeller lived a disciplined life, forever pinching pennies but mindful of his Christian duties. Even in 1855, when he was earning \$3.50 a week as a clerk accountant in Cleveland, Rockefeller carefully apportioned about 10 percent of his income to charities and church work. His philanthropy grew with his riches; by 1881 he was giving away more than \$60,000 a year.^^ By the end of the century, he and Carnegie were competing in their philanthropy—with Carnegie ahead.

Rockefeller was diligent in giving to charity but ungenerous in spirit. Like other men of his day climbing the ladders of business success and those who had reached the top. Rockefeller saw no excuse for poverty. Having gone into business for himself at the age of twenty, the oil king "knew" that hard work and disciplined living were the means to escape poverty. In 1887 Rockefeller answered a poor young man's plea for fifty dollars with a check, a request for an I.O.U., and a warning: "It will be injurious for him to receive from others what he can in any way secure for himself by his own efforts." And after a visit to a "house of industry" in New York's incomparable slum of Five Points, he complained that although the institution gave free meals to the area's "tramps" only on Thanksgiving Day, he "would give them work and make them earn their food."^^

Whereas Carnegie's secular views led him to Social Darwinism as a biological and social explanation for the maldistribution of wealth, Rockefeller's religion exorcised all self-doubts. Particularly as he grew older and more comfortable with his fortune and his role as philanthropist, Rockefeller came to believe that "God gave me my money." When he uttered these words in 1905, "Rockefeller" was not the most revered name in North America. He thus felt called upon to explain: "I believe the power to make money is a gift from God ... to be developed and used to the best of our ability for the good of mankind. I believe it is my duty to make money and still more

money and to use the money I make for the good of my fellow man according to the dictates of my conscience."^^

Rockefeller's conscience led him to heap great benevolence on a wide range of socially uplifting charities. Andrew Carnegie put churches last on his list of recommended philanthropies, but for Rockefeller the Baptist church and its numerous charities and missions were the highest priority. Hospitals and other public

### 34 I "Wholesale Philanthropy"

welfare charities were also favorites. He hoped his contributions would enable the denomination to lead all people to live with rectitude and to aid the fallen poor to gain the proper path. In 1890 Rockefeller's contributions to charities and colleges topped \$300,000, and the next year half a million dollars.

But in May 1889, one month before Carnegie published the first of his two-part "Gospel of Wealth," Rockefeller committed himself to a particularly ambitious philanthropic project and a relationship with a man who was to write a new chapter in philanthropy. For several years a group of Baptists in the East and another group in the West had been trying to develop a new seminary and university for the denomination. The eastern group wanted the institution to be located in New York while the other group desperately hoped to develop it in Chicago, the rapidly growing metropolis of the nation's westward expansion. Both groups were pressing Rockefeller, the richest Baptist in the world, to contribute the millions needed to endow a first-rate institution. While interested in such a project, Rockefeller was not swayed by the emotionalism of either group's appeal."^^

The strugglng academies, seminaries, and colleges of the denomination met in Washington in May 1888 to form the American Baptist Education Society, to raise money for Baptist education, and to coordinate its development. They named the fast-rising Reverend Frederick T. Gates executive secretary, a position from which he leaped to the pinnacle of both philanthropic and corporate power.

Gates immediately conducted a survey of Baptist educational needs throughout the country. Armed with his data, he wrote a detailed and eloquent report. Gates demonstrated that nearly half the country's Baptists lived west of Pennsylvania and north of the Ohio River but that the denomination's educational facilities in this region were practically worthless. He concluded that a new Baptist university should be built "on the ruins of the old University of Chicago," a weak and by then bankrupt denominational institution. While the new university should bring together the most capable specialists in both its classical and scientific departments, it must be "an institution wholly under Baptist control as a chartered right, loyal to Christ and His church, employing none but Christians in any department of instruction, a school not only evangelical but evangelistic.""\*

Gates' report was the turning point in the denomination's

### "Wholesale Philanthropy" I 35

campaign for a university. As he himself put it, "The brothers were 'all torn up' over it." The Chicago proponents coalesced around the report, and the dwindling supporters of a New York location became even more emotional in their desperate appeals to Rockefeller. The Education Society executive board unanimously approved the proposal at the December 1888 meeting. Within six months Gates won Rockefeller's approval and an initial gift of \$600,000 that soon became a torrent of support, totaling \$35 million in the next twenty-one years. Rockefeller was so impressed with Gates that he wrote University of Chicago president Harper in 1889, "I have made up my mind to act in my educational benefactions through the American Baptist Education Society."^^

Rockefeller, worn out by his total immersion in business since the age of twenty, was a physical wreck as he entered his fifties in 1889. He suffered increasingly from nervous fatigue and stomach ailments. He soon lost all his hair, including his eyebrows, because of a nervous disease, generalized alopecia. His doctors had warned him to reduce his activities as much as possible, but his responsibilities were mounting. Although Standard Oil was now in the hands of experienced and trusted lieutenants, there was an increasing flow of requests for large and small portions of his wealth from churches, missionary societies, hospitals, colleges, charity organizations, and individuals—once running as high as 50,000 requests in a single month."^^

In March 1891 Rockefeller sat Gates down and laid out his problem.

I am in trouble, Mr. Gates. The pressure of these appeals for gifts has become too great for endurance. I haven't the time or strength, with all my heavy business responsibilities, to deal with these demands properly. I am so constituted as to be unable to give away money with any satisfaction until I have made the most careful inquiry as to the worthiness of the cause. These investigations are now taking more of my time and energy than the Standard Oil itself. Either I must shift part of the burden, or stop giving entirely. And I cannot do the latter.'\*''

"Indeed you cannot, Mr. Rockefeller," replied Gates, listening with great care and at the same time anticipating the benefactor's point.

"Well, I must have a helper," Rockefeller continued. "I have

36 I "Wholesale Philanthropy"

been watching you. I think you are the man. I want you to come to New York and open an office here. You can aid me in my benefactions by taking interviews and inquiries, and reporting the results for action. What do you say?"

Fervently aware of the wealth and power that would rest in his hands to use on behalf of all the things he believed important, Gates accepted without the slightest hesitation. He thus began a relationship with Rockefeller that transformed the world's largest fortune into the most strategically applied philanthropy, estabshing principles, methods, and directions that were soon emulated by other philanthropists and continued through the next two generations of the Rockefeller dynasty. The numerous medical and public health programs would become the central part of Gates' strategy.

In September 1891, Gates took an office in the Temple Court Building in New York City, not far from Rockefeller's Standard Oil offices at 26 Broadway. He continued his work for the Education Society even while he took charge of Rockefeller's philanthropy. The supplicants who hounded Rockefeller "almost like a wild animal" were sent to Gates' office. "I did my best to soothe ruffled feeUngs, to listen fully to every plea, and to weigh fairly the merits of every cause," Gates recalled of his days at Temple Court."^^

With the same systematic thoroughness that marked his report for the Education Society, Gates investigated each request that came his way. "I found not a few of Mr. Rockefeller's habitual charities to be worthless and practically fraudulent. But on the other hand I gradually developed and introduced into all his charities the principle of scientific giving, and he found himself in no long time laying aside retail giving almost wholly, and entering safely and pleasurably into the field of wholesale philanthropy.""^^

Gates' first act on behalf of "wholesale philanthropy" was to increase Rockefeller's contributions to state and regional Baptist agencies and cut off contributions to individual churches, missions, and charity organizations. By forcing every church and mission to get their aid from centralized denominational boards, Gates increased the latter's power over the far-flung flock.'\*''

Not long after he moved to New York, Gates took charge of

"Wholesale Philanthropy" I 37

Rockefeller's many investments outside the Standard companies. As with his charities, Rockefeller always intended to check on his investments thoroughly before buying into them. Often he was persuaded by acquaintances to invest in a project or industry they assured him would pay off handsomely. Most of the immense "surplus" wealth that Rockefeller was taking out of oil he was putting, not into charity, but into "a good many different industries." By 1893 he had accumulated, besides the Standard, sixty-seven major investments, valued at \$23 million, in railroads, mining, manufacturing, and banks. "It occurred to me," Rockefeller later recalled, "that Mr. Gates, who had a great store of common sense, though no especial technical information about factories and mills, might aid me in securing some first-hand information as to how these concerns were actually prospering." He asked Gates to investigate some of these investments when he happened

to be in the area on Education Society business."^\*

Gates checked on several of Rockefeller's distant stakes: an immense land speculation scheme in the Pacific Northwest that two fellow parishioners of Rockefeller's Fifth Avenue Baptist church had persuaded the oil baron to invest in; a \$600,000 investment in a West Superior, Wisconsin, steel mill and land speculation fraud, recommended by the same brethren; and a smaller iron furnace in Alabama. Gates demonstrated his varied abilities and singular value to his employer. "His report was a model of what such a report should be," Rockefeller remarked with uncharacteristic praise. "It stated the facts, and in this case they were almost all unfavourable." One investment that Rockefeller thought was earning \$1,000 a day was instead losing that amount.'\*^

One more investigation by Gates, of some reputedly rich gold mines in Colorado that turned out to be a complete fraud, settled the matter for Rockefeller. His income was now upwards of \$10 million a year, he was physically and emotionally coming apart at the seams, and he desperately needed a lieutenant in whom he could place complete confidence. He asked Gates to drop his office in the Temple Court Building and share his private offices at 26 Broadway. "That," wrote Gates, "is how I came to be a businessman."^o

38 I "Wholesale Philanthropy"

THE REVEREND FREDERICK T. GATES:

THE MAKING OF A ROCKEFELLER MEDICINE MAN

It is not surprising that Gates should be such an appealing assistant in both philanthropy and finance. Although he graduated from the Baptist-controlled Rochester University and the Baptist seminary in Rochester and then spent eight years in the ministry, Gates was at heart a businessman in spiritual clothing. As he himself said in his autobiography,

Much of my life has been in fact an unconscious preparation for successful business. My interesting experience in selling harrows, my months as a clerk in a country store, and as cashier of a country bank, my interest in my father's financial affairs and the ways and means of paying our debts, my studies of political economy under Doctor Anderson [at Rochester], my close study of the finances of our church building in Minneapolis, a habit of looking at things in their financial tendencies and relations, my study of denominational finances at home and abroad, all these things had given me a business experience and my mind a financial turn.\*'

Gates was nearly thirty-eight years old when he went to work for Rockefeller. His early years were spent in rural poverty. His father had studied medicine but turned to the Baptist ministry for his life's work. The elder Gates' successive congregations were mainly poor farmers in rural New York; his family shared that poverty which bred at least part of Frederick's determination to leave it behind in his own life. When the family moved to Forest City, Kansas, Frederick began but had to quit high school and then taught school to earn money to help his family pay off the accumulating debt on their farm." Through high school and college jobs Gates worked with his characteristic diligence and energy and discovered how much he pleased his employers. His shrewd salesmanship earned him \$1,500 for selling harrows. Gates was developing a sense of where his ambition might eventually take him.

Young Gates' experiences with religion were as important in shaping his future life as were his experiences with poverty. "The best that religion had to offer me as a boy," he wrote near the end of his life, "was death and heaven, the very things I most dreaded—being a normal, healthy boy." With his teaching job

"Wholesale Philanthropy" I 39

Gates developed a strong attraction to the intellectual and personal elements of religion, though his conversion was not an emotional one. He found Christ's social and moral teachings very attractive: "I was drawn to his person and character, and from that throughout my life I wanted to side with him and his friends against the world and his enemies. Such, frankly, was the only 'conversion' I ever had."

He found his seminary training so academic as to leave him poorly prepared for ministerial work. He dispensed with the philosophical idealism the seminary had cultivated, and from his own reading, his life experiences, and examination of the economic and social issues affecting his congregation. Gates took up a pragmatic philosophy that was more in keeping with his personality and his ambition. His fund-raising work for his poor parish in Minneapolis and his less solemn, more modern sermons attracted a bigger congregation and with it, more wealth.

One day George Pillsbury, whose flour fortune made him the wealthiest Baptist in the Northwest, asked Gates' advice in making up his will and especially in leaving \$200,000 to a Baptist school. Pillsbury was very pleased with Gates' suggestion that he immediately give \$50,000 to the school on the condition that the denomination in Minnesota raise an equal amount—to assure their committed interest in it—and that he bequeath another \$150,000 to the school in his will. Baptist leaders were also pleased and commissioned Gates to raise their \$50,000 share of the funds. Gates resigned his pastorate and took up the challenge. So effective were his methods of button-holing Baptists in the state that he had soon raised \$60,000." Gates knew he had found his calling!

He developed a number of rules for fund raising which he learned "mostly on the pastorate" and a couple of years later wrote them down at the request of his admirers in the trade. Dress well, act in a dignified manner, pretend the visit will be a short one, be good-natured, and "keep your victim also good-natured. . . . Let him feel that he is giving it, not that it is being taken from him with violence." Rule number 7 he followed unswervingly through his nearly four decades of service to Rockefeller: "Appeal only to the noblest motives. His own mind will suggest to him the lower and selfish ones. But he will not wish you to suppose that he has thought of them. He wishes you to

#### 40 I "Wholesale Philanthropy

believe him to be giving only from the highest motives."^\* In a few years Gates rose from pastor of an average Baptist congregation in Minneapolis, to a statewide position with the denomination in Minnesota, to chief officer of the Baptists' national Education Society, to the side of Mr. Rockefeller himself, administering a panoply of investments and an immense philanthropy.

As soon as he joined Rockefeller's private office to manage his finances. Gates began a meticulous evaluation of all Rockefeller's holdings outside the Standard Trust. He was given a free hand in reorganizing investments and corporations alike and was provided with assistants, credit, and confidential information. "I had every needed tool," Gates remembered, "and the machinery was well oiled and without the least friction. No man of serious business responsibilities ever had a happier business life than I. No man was ever furnished with more of the external elements of success, or given better opportunities." In some companies Gates bought enough stock to take control and put in management acceptable to him and Rockefeller. Other investments were sold off completely. In the end. Gates was made president of thirteen corporations in which Rockefeller now had a controlling interest. He added sizeable chunks to Rockefeller's geometrically increasing fortune, the grandest chunk being the \$55 million profit Gates made on selling the Mesabi iron ore range and associated industries that he had developed.^ ^

Although Gates came to Rockefeller's employment a poor man, he soon remedied this unfortunate condition. While executive secretary of the Baptist Education Society, Gates was paid a then-respectable income of \$2,500 a year. When he moved East and opened an office in the Temple Court Building, Rockefeller added \$1,500 to his income. His added responsibilities led to annual increases in salary "always paid by the corporations which I managed," until after ten years with Rockefeller he was getting a salary of \$30,000, a very good income in the first decade of this century. Out of his earnings Gates and his wife had saved enough to pay for their Montclair, N.J., home and had invested some \$60,000 in the companies he had organized and managed for Rockefeller. That small investment brought him more than \$500,000 when he sold his shares in 1902. "Prudent investments with few losses gradually increased

this sum." In 1916 Gates began converting all his investments into then-rising and profitable bank stocks and encouraged Rockefeller to do the same, recommending especially the Chase National Bank, which was paying dividends of 20 percent on invested capital. By the time of his death in 1929 Gates was a wealthy man though, needless to say, his fortune fell far short of his employer's.^ ^

Though Rockefeller never paid direct compliments to any person, he more than once recorded his appreciation of Gates' "phenomenal business ability." In response to a reporter's question, "Who is the greatest of all the business men you have known?" Rockefeller heaped warm praise on Gates. "He combines business skill and philanthropic aptitude to a higher degree than any other man I have ever known."^ ^ Though Gates was involved with Rockefeller's finances in important ways, his organization of Rockefeller's philanthropies, and especially the medical programs, makes him historically significant.

In 1897, John D. Rockefeller, Jr., graduated from Brown University and was cautiously trying to find a place for himself in a world preempted by his father. His hereditary position in the world of industry and finance left him little room for any achievement that he could call his own. His own name was inseparable from his father's, who was perhaps the most vilified of all the great robber barons. The one area in which he might stake out new ground and at the same time help clear the family name was philanthropy. And thus he entered his father's private offices at 26 Broadway, an imperium presided over by the Reverend Gates.^ ^

With difficulty Gates and "Mr. Rockefeller, Junior" developed a working relationship. Junior was then twenty-three years old, inexperienced, and reserved to the point of shyness. Gates, twenty years his senior, did not hide his self-confidence derived from varied experience and personal achievement; he was ebullient. Nevertheless, Junior learned from Gates and from his own successes and failures and built an independent role for himself in both philanthropy and finance. For his part, Gates learned to tolerate this scion of the man he worked for and truly respected. Gates considered Junior "diligent" but unimaginative. "He was home-made and hand-trained," he recalled disdainfully. Rockefeller, Sr., had found, as his biographer Allan Nevins

#### 42 I "Wholesale Philanthropy"

observed, "just the combination of qualities he needed: Gates endowed primarily with imagination, fire, and vision, the son endowed primarily with hard sense, caution, public spirit, and conscientiousness."^ ^

Gates and Junior investigated new lines of philanthropy and the value of Senior's investments, bringing major proposals for action on both to the financier for final decisions. Gates wrote his views in eloquent reports; Junior relied on oral persuasion. "Gates was the brilliant dreamer and creator," Junior recalled years later. "I was the salesman—the go-between with Father at the opportune moment." Senior seldom jumped into any new venture. "I'll let the idea simmer," he often told his son and Gates. Then weeks, months, or even years later, moved by considerations inscrutable to his assistants, he was ready to act.^ °

Gates was also quite a contrast to his employer. As Raymond Fosdick, president of the Rockefeller Foundation for more than a decade, revealed:

Mr. Gates was a vivid, outspoken, self-revealing personality who brought an immense gusto to his work; Mr. Rockefeller was quiet, cool, taciturn about his thoughts and purposes, almost stoic in his repression. Mr. Gates had an eloquence which could be passionate when he was aroused; Mr. Rockefeller, when he spoke at all, spoke in a slow measured fashion, lucidly and penetratingly, but without raising his voice and without gestures. Mr. Gates was overwhelming and sometimes overbearing in argument; Mr. Rockefeller was a man of infinite patience who never showed irritation or spoke chidingly about anybody.

From this triumvirate came the influential philanthropies that asserted extraordinary leadership in shaping the social, economic, and political order of the twentieth century. Rockefeller, the individualistic captain of industry from the rough-and-tumble old order that was being transformed at the turn of the century, supplied the money but left the directing to his lieutenants. Gates, the transition figure from unbridled individualism to the discipline of the corporation, provided systematic methods and a rudimentary strategy for asserting corporate

capitalism's needs for supportive social institutions. Junior, emerging gradually as the nation's foremost representative of modernism in corporate relations with labor and the public, brought a refinement and sensitivity to the philanthropic work being developed by Gates.

## "Wholesale Philanthropy" I 43

The programs and strategies that emerged from this center of financial power had an enormous impact, especially on medical care and health systems in the United States and throughout the world."

## THE GENERAL EDUCATION BOARD: \$129 MILLION FOR STRATEGIC PHILANTHROPY

Gates shared Carnegie's fears that excessive hereditary wealth diminishes individual initiative and achievement, that it saps the participation of its bearer in the social and economic processes that make society strong. "Your fortune is rolling up, rolling up like an avalanche!" he warned Rockefeller. "You must keep up with it! You must distribute it faster than it grows! If you do not, it will crush you, and your children, and your children's children!"

Having acquired the fortune, it fell to Rockefeller and his associates to maintain it as a trust for the people, just as Carnegie had advocated. "It is the duty of men of means," Rockefeller wrote early in this century, "to maintain the title to their property and to administer their funds until some man, or body of men, shall rise up capable of administering for the general good the capital of the country better than they can." In his view, neither experiences with state and national legislatures nor "schemes of socialism" offered any promise that "wealth would be more wisely administered for the general good" than it was by its private owners. ^^

Since the owners of capital were mortal men, it was incumbent on them to provide some ongoing trust to see that their wealth would be used wisely even after they passed from the scene. There was nothing new in this concept as understood by the Rockefellers as they launched their first grant-giving foundation, the General Education Board, to aid Southern education. Charitable trusts independent of the state and the church have had legal status in Anglo-Saxon law since the "statute of charitable uses" was enacted by Queen Elizabeth in 1601. Most of these, however, had been narrowly prescribed uses—endowing a particular hospital, giving relief to wayward girls in Brooklyn, and providing scholarships for young men entering mechanical engineering at a particular college.\*

## 44 I "Wholesale Philanthropy"

However, there were a few precedents that greatly influenced the creation of the General Education Board, providing the first of its strategic philanthropic programs aimed at transforming major social institutions. At the close of the Civil War, merchant-banker George Peabody provided \$2 million for a Southern education fund. The war had left the South in ruins and its schools destroyed or otherwise defunct; a generation of Southerners was growing up uneducated and essentially illiterate. The Peabody Education Fund hired Barnas Sears, the president of Brown University, to set up a grant program to help schools that were run and generally supported by Southerners. Sears was succeeded by Jabez L. M. Curry, a Confederate politician and planter from Alabama, who had saved his land from confiscation after the Civil War by swearing allegiance to the United States. ^^

The Peabody Fund set an example for John F. Slater, a textile manufacturer from Connecticut, who endowed a \$1 million fund in 1882 to educate Southern blacks. By the end of the nineteenth century increasing numbers of Northern businessmen and Southern reformers were coalescing around the need to develop Southern schools in general and educate Southern blacks in particular. The South was not only economically and educationally undeveloped; it was the section of the country from which militant populism still received its widest political support, threatening the ambitions of Southern liberal reformers and Northern conservative businessmen who wanted to "modernize" and industrialize the region. In 1899 these leaders organized the first of several Conferences for Southern Education. ^^

John D. Rockefeller, Jr., was a guest at the third conference in 1901. Robert C. Ogden, a partner of John Wanamaker and general manager of their New York department store, chartered a special train, dubbed the "millionaires' special" by hostile Southern newspapers, to bring Northern businessmen on a tour of Southern

black schools and then to a conference with Southern activists in the cause. Junior and the other guests visited the Hampton and Tuskegee institutes and other schools and ended their tour with a meeting in Winston-Salem. This conference established a permanent organization called the Southern Education Board (SEB) to raise money among Northerners, assume formal leadership of the campaign to develop Southern schools, and conduct propaganda on its behalf. Though the board's

## "Wholesale Philanthropy" I 45

budget was low—not more than \$40,000 a year—and they never gave grants as the Peabody and Slater funds were doing, the SEB hired agents to carry their campaign to influential Southerners and state legislatures.^\*

Like the Peabody and Slater funds, essentially combined under the leadership of their chief agent J. L. M. Curry, the Southern Education Board unanimously supported only "industrial education" for blacks. Schools organized around this model taught the rudiments of literacy and emphasized industrial and agricultural skills, disciplined work, thrift, and right living. Hampton Institute, whose chief trustee was Ogden and whose principal was fellow SEB member Horatio Frissell, was the prototype of industrial schools for blacks. Booker T. Washington, an early graduate of Hampton, founded a similar school at Tuskegee, Alabama, and became the country's chief black proponent of the gradualist strategy of racial progress. For half a century this model of education guided the work of the movement for compulsory schooling, and now it was the centerpiece of the progressive education movement, sweeping educators and businessmen alike into a national educational reform campaign.\*^

Northern and Southern businessmen were enthusiastic. "Every element for success exists in the South," the Manufacturers' Record declared in support,

in raw material, in climate, in the forces of Nature, and above all, in an abundant supply of labor, which when properly trained and disciplined will be the main reliance of the South in the future for its prosperity. It only remains for the South to do its duty to its black population by way of training and educating in the simple manual trades.""

With the support of Northern money, the industrial schools flourished and the few genuine colleges for blacks struggled under their less than benign neglect. The Southern Education Board and its allies won grudging acceptance of schools for blacks from Southern white supremacist political leaders, and in return Northern members of the SEB campaigned in the North for acceptance of black disfranchisement and Jim Crow laws as the best way to progress for blacks. "The white people are to be the leaders, to take the initiative, to have the directive control of all matters pertaining to civilization and the highest interests of our

## 46 I "Wholesale Philanthropy"

beloved land," Curry, former Confederate officer and now chief of staff of the Southern campaign, brazenly proclaimed. "This white supremacy does not mean hostility to the Negro, but friendship for him."^'

For John D. Rockefeller, Jr., his 1901 tour and conference in the South were "one of the outstanding events in my life." Filled with a sense of mission, Junior discussed the new Southern Education Board and its program with his father, Gates, his friend Morris K. Jessup, and Dr. Wallace Buttrick, the portly and jovial secretary of the Baptist Home Mission Society, who also attended the conference and was now a member of the SEB. A small group was formed to develop an ambitious project in support of the Southern work. In January 1902, they outlined a munificent philanthropic enterprise. In February an expanded group met for dinner at Junior's house and worked through the evening. Junior announced a pledge he had secured from his father for \$1 million to spend over the next ten years, the first and smallest of many gifts to come. They formed a board of trustees to oversee the expenditures and appointed Buttrick executive secretary."^ "The South with its varied resources and products," their memorandum of agreement observed, "has immense industrial potentialities, and its prosperous future will be assured with the right kind of education and training for its children of both races.""^

The General Education Board was announced to the press. "The object of this association," they explained, "is to provide a vehicle through which capitalists of the North who sincerely desire to assist in the great work of

Southern education may act with assurance that their money will be wisely used."<sup>^</sup>"\*

The General Education Board (GEB), with its large resources, quickly became the locus of leadership in the Southern campaign. At its first meeting in 1901 the Southern Education Board had arranged a "community of interest" with the Peabody and Slater funds. By 1903, according to Southern board member Frissell, "the Peabody and Slater boards are now acting very largely through the General Education Board." In fact a more interlocking directorate could not be found, even among the Standard Oil companies. Several trustees of the Slater and Peabody boards were trustees of the GEB. Curry was a member or agent of all four funds. Buttrick was a member of the Southern

"Wholesale Philanthropy" I 47

board, executive secretary of the GEB, and from 1903 to 1910 he was an agent of the Slater Fund—and so on."

While the General Education Board developed other programs over the next several decades, medical ones prominently among them, their work in the South remained important and never deviated substantially from their original perspective. Over the years the GEB worked to make all schools "more responsive to our social, economic, and professional needs." The black population's role in society was clear. The board believed "the Negro must be educated and trained . . . that he may be more sober, more industrious, more competent." When the GEB finally came to support full-fledged colleges for blacks, it was not because their general outlook on race relations had changed. College training would be "provided for carefully selected Negroes" who will "lead the race in its efforts to educate and improve itself." The black's leaders "must be trained, so that, looking to them for guidance as he does, he may be as well guided as possible."<sup>^</sup>

The GEB was not concerned only with education of blacks. It worked to build up high schools for whites and for blacks throughout the South. Always with an eye to creating "local responsibility for self-help"—what Gates called the "foundation of character and social life itself"—the board's strategy was to stimulate and organize community support for school taxes. The GEB got each state university to create a professorship for secondary education. Then with the university's approval, the board defined the duties of the position and named the person to be hired and, in return, paid the person's salary and all his expenses. The main function of this professor was not to teach but to organize. He would visit the towns of his state—"as an officer of the university, laden with its wisdom and its moral authority"—and develop and channel local support for high schools and taxes to support them. At the end of two decades of work, the GEB had spent a little over \$3 million promoting public schools in the rural and urban South. They considered the plan effective "beyond our most sanguine anticipations" and took considerable credit for the 2,000 new high schools built in that period at a cost of \$60 million, for which annual appropriations in the Southern states increased from \$1.7 million in 1905 to \$15 million in 1922—"all raised by local taxation."<sup>^</sup>

48 I "Wholesale Philanthropy'

The public schools program of the GEB led to a farm demonstration program run for the board by Seaman Knapp and then to the first of a long tradition of public health programs conducted by the Rockefeller foundations. Rooted in the same concern for Southern economic and social development that guided the public schools program, the public health programs, at first in the Southern states and then exported around the world, became important supports for the growing domination by U.S. capital, trade, and military power."<sup>^</sup> Gates, a charter member of the GEB and its chairman from 1907 to 1917, was the eloquent orator and, in Junior's words, "the brilliant dreamer and creator" of most of these programs.

The permanence of the General Education Board was assured with a broad congressional charter, dedicating the new foundation to "the promotion of education within the United States." Senator Nelson Aldrich, Junior's father-in-law and a powerful representative of business in Washington, "took the bill into his own hands and put it through in record time." It was officially chartered in January 1903, a year after it began its first Southern program, yet the most influential work of the GEB was yet to come.<sup>^</sup><sup>^</sup>

Gates took into his own bosom the worries about Rockefeller's still-growing fortune. "I have lived with this

great fortune of yours daily for fifteen years," he wrote his employer in 1905. "To it, its increase and its uses, I have given every thought, until it has become a part of myself, almost as if it were my own."<sup>50</sup>

Recognizing the mortality that all persons must face, Gates laid out the alternatives to Rockefeller. "One is that you and your children, while living, shall make final and complete disposition of this great trust, for the good of mankind. The other is that you shall not do this, but shall hand it down to unborn generations, for them to decide how this trust shall finally be discharged for humanity."

For Gates, embracing Carnegie's "Gospel" and fearing the "powerful tendencies to social demoralization" of inherited wealth, the first alternative was the only moral one. He proposed that Rockefeller decide what major lines of work for "human progress" he wanted to serve and who should administer the funds and then create an endowment "to provide funds in perpetuity, under competent management, with proper provision for succession."

"Wholesale Philanthropy" I 49

Gates then suggested several funds for different areas of work—"a great fund for the promotion of a system of higher education in the United States, ... a fund for the promotion of medical research throughout the world, ... a fund for the promotion of the fine arts," and more. "These funds should be so large that to become a trustee of one of them is to make a man at once a public character." The work of these enterprises should employ "the best talent of the entire human race."

Junior followed this letter with his own enthusiastic endorsement of Gates' proposal. Within two weeks Rockefeller, Sr., gave the General Education Board \$10 million and followed that a year and a half later with another \$32 million. By 1921 Rockefeller's gifts to the GEB totaled more than \$129 million. Larger and more numerous endowments began to flow to the Rockefeller Institute for Medical Research, fathered by Gates from his employer's fortune in 1901, and soon discussions began that led from Gates' 1905 letter to the creation of a much larger and broader fund, the Rockefeller Foundation, to which Senior gave more than \$182 million.

It is not so clear that Gates' only concern in recommending that Rockefeller himself dispose of his fortune was the danger of inherited wealth to its possessors. The notoriety that accrued to Rockefeller and other robber barons along with their profits cast a long shadow on the future of wealth, and the Rockefellers felt the chill as much as anyone. Henry Demarest Lloyd, in *Wealth Against Commonwealth* published in 1894, and Ida Tarbell, in a magazine series ending in 1904, had tarred and feathered the Standard Oil Trust. The Socialist movement was winning the support of working people throughout the country for its program to do away with private capital altogether. And perhaps most frightening of all, upstanding middle-class Americans, professionals and businessmen with values very much like the Rockefellers themselves, were joining the call for Progressive reforms. The Progressive movement, while firmly supporting capitalism, was calling for constraints on the accumulation and concentration of private wealth. Roosevelt was elected in 1904 on a platform that at least threatened to break up monopolies.

"I trembled," Gates later recalled, "as I witnessed the unreasoning popular resentment at Mr. Rockefeller's riches, to the mass of the people a national menace." Gates might believe that Rockefeller "used his wealth always and only in the public

50 I "Wholesale Philanthropy"

interest," that his fortune had been created by economies rather than by theft, that his wide investments in industry and finance constituted "vast permanent contributions to the wealth and well-being of the American people." But few people in the country not connected with 26 Broadway agreed with him.<sup>51</sup>

In the fall of 1906 the federal government launched a major suit to break up the Standard Oil Trust, and that litigation began its five-year journey through the courts. After Rockefeller gave the GEB \$32 million in 1907 to finance Gates' plan to create "a system of higher education in the United States," many respectable newspapers and magazines suggested that "the purpose of Mr. Rockefeller's large gift is to head off, if possible, the teaching of socialism, which is on the increase ... in a number of universities." Also in 1907 federal Judge Kenesaw

Mountain Landis hit the Indiana Standard company with a \$29 million fine for obtaining rebates on its railroad shipments, one of the "economies" in which Gates and Rockefeller took pride. "No oriental despot . . . has committed such arbitrary acts of confiscation as the present administration is responsible for under the forms of law," Gates railed.<sup>^^</sup>

The Landis fine was quashed on appeal, but the spectre of dissolution and ultimately of confiscation pursued the Rockefellers and many of their class. The Rockefeller philanthropies created new programs and with them new images for the benefactors. The programs appealed to their perceptions of social needs, but in their perceptions, society's needs were indistinguishable from their own. Colleges were expanded and organized into a system of higher education to produce the professionals and managers the corporate society badly needed, but the GEB for two decades consciously followed Gates' directive to strengthen private rather than state universities because private institutions, controlled by men and women like themselves, would be more likely to "direct popular opinion into right channels."<sup>\*^</sup> The medical philanthropies, outwardly appearing only to fill an obvious social need, helped to develop a medical care system peculiarly suited to the needs of corporate capitalism, as we will see in subsequent chapters.

## SOCIAL MANAGERS FOR A CORPORATE SOCIETY

It is clear that John D. Rockefeller, Sr., was neither the initiator nor the strategist in his philanthropies. In the early years

"Wholesale Philanthropy" I 51

it was Gates and then Gates and Junior whose ideas and strategies shaped the elder Rockefeller's fortune into purposeful programs. In part the insight they showed concerning the needs of capitalist society may be attributed to their individual personalities, shaped by their own life experiences. But they were also representative of the new class of men (and very few women at that time) who provided the managerial skills needed by corporate industry and finance. Unlike the individualistic entrepreneurs who built the enormous industrial and financial empires around themselves in the latter nineteenth century, these new managers were more sensitive to the smooth workings of their enterprises.

In industry, management's role was to rationalize production, to divide the productive process into "efficient" units, and simultaneously to coordinate each with the other to produce a unified organization, linked in a similarly coordinated fashion with disparate sources of investment capital and raw materials at one end of the production line and with a system of distribution and marketing at the other end. Analogous managerial roles were also developed in government bureaus and departments, then in colleges and the emerging universities. The last major area to which skilled management was directed were the social services—charity and social welfare programs, philanthropic foundations, and medicine.

The foundations were key instruments in early efforts to rationalize social services, public health, and medical care under the control of specially trained managers in those fields, and the foundations themselves became the turf of this same management class. It made little difference whether one owned a substantial share of the country's corporate wealth or whether one simply ran the factories and institutions owned by the wealthy. The actions of each group were essentially the same, and their values were quite similar. They both accepted the prevailing economic, social, and political system as given, and they sought to make the system work smoothly.

Some of these system managers used charity to try to make capitalist society, whose ideal model is a purely competitive marketplace, a less "rigid and heartless" one, as a recent proponent of this view put it. He believes that philanthropy should "provide at least some softening of the corners and relaxation of the rigid rule of self-interest."<sup>\*\*\*</sup>

52 I "Wholesale Philanthropy"

Others like Gates and John D. Rockefeller, Jr., conceived of a more strategic role for philanthropy—the transformation of social institutions. They worked to make the nation's colleges and universities into a system that would more efficiently yield technically trained and properly socialized professionals and managers for the

system. They developed new roles for professionals as managers, and they helped rationalize the institutions in which these professionals worked.

Men like the Senior Rockefeller and Andrew Carnegie knew little of this work. They had understood its relevance to industry where they had been the first ones in oil and steel, respectively, to create vertically integrated corporations, owning or controlling the entire process from oil wells and iron ore mines, to transportation, refining and manufacturing, distribution, and marketing. But running a corporation is different from running a corporate society, and though they understood the need to take more control over social institutions, they did not understand how.

Carnegie, egotistical and individualistic, thought he understood. Until Andrew Carnegie began giving away libraries in the 1880s, the world had never seen such a vast fortune applied to private philanthropy. This remarkable innovation in magnitude of philanthropic wealth—due, of course, to his insatiable ambition in industry rather than to any strategic genius in philanthropy—gave him a social power so vast that it proved truly befuddling. Armed with a crude social philosophy, he set forth to civilize the lower classes and set a model of responsibility for the upper echelons of society. The society he hoped to preserve was one based explicitly on enormous disparities of wealth. And he attempted to preserve the individualism he and other Social Darwinists revered with a largely individualistic approach to social transformation. His programs represented his own personalized views, shared in varying degrees by contemporary capitalists. But Carnegie's vision was a limited one and his programs often stepped over the edge into absurdity. When Carnegie retired from the steel business in 1901, his philanthropic plans were vague and scattered. In the words of his biographer Joseph F. Wall, "For someone who had written so extensively and preached so eloquently as he on the duties of the man of wealth, it is rather surprising that he faced this task better armed with platitudes than with any concrete program of action."<sup>^</sup>

'85

## "Wholesale Philanthropy" I 53

After several years of massive spending without a real plan, Carnegie set up his foundations, and his hired managers began accomplishing what he had not. In 1905 Carnegie began to move from his individualistic method of dispersing money to a more rationalized, systematic model. Appalled by the pitiful incomes of college professors—usually not more than \$400 per year—Carnegie had meant to do something about them for some time. But it was Henry S. Pritchett, the president of the Massachusetts Institute of Technology, who moved him to action. While visiting Carnegie at his ancient castle in the Scottish Highlands in the summer of 1904, Pritchett lamented the difficulties he had in attracting young scientists and engineers to teach at MIT. Academic salaries could not compare with those offered by private industry, and few colleges even had pension systems to provide a minimum of financial security for professors. There were more discussions the following winter, and in April 1905 Carnegie announced the creation of his college teachers pension fund with an initial endowment of \$10 million in U.S. Steel bonds. A board of trustees was selected consisting mainly of the presidents of the most elite universities and colleges in the country. Pritchett was appointed president of the new Carnegie Foundation for the Advancement of Teaching.<sup>\*^</sup>

Under Pritchett's guidance the new foundation set out to recast American higher education. The free pensions became the carrot-at-the-end-of-the-stick that colleges would follow down the path of reform. An applicant college or university had to have a minimum of \$200,000 endowment to qualify for the pension program. Neither state colleges nor those controlled by religious denominations were eligible. Finally, to be eligible a school had to require of its students a prescribed minimum of high school preparation prior to admission. This last requirement proved a successful attempt by the foundation to "throw its influence" in favor of a "differentiation between the secondary school and the college" in order to create "a system of schools intelligently related to each other and to the ambitions and needs of a democracy." Although only fifty-two of the original 421 applicants were eligible for the pension plan, other schools soon modeled themselves on the Carnegie system to make themselves eligible. Denominational colleges cut loose from their controlling churches to take advantage of the plan, and the foundation's rules

were changed to include state institutions. Soon virtually every high school and college in the country measured student progress in "Carnegie units." A national system of education was taking shape with the prodding of Carnegie pensions and the Carnegie Foundation as the unofficial accrediting body.^"

Almost immediately after opening the offices of the Carnegie Foundation, Pritchett began consulting with the General Education Board. His only regret, he told GEB executive secretary Wallace Buttrick, was that "I did not come to you before renting my office for it would be of great benefit to us to be located near you." Pritchett admired Gates, often asked for his advice, and tried to get Carnegie to mend his philanthropic ways. In fact the record left behind suggests that Pritchett's ideas on systematizing higher education were derived from Gates.\*\*

The leadership that attracted this following was Gates' vision of how wealth could rationalize higher education. He described a picture of the GEB, through its "moral influence" as well as its money, fostering cooperation among colleges and universities and securing economies "in administration, in teaching force and in the use of men." He hoped that such a philanthropic board, properly endowed, would "select" and "direct" the resources of higher education, much as the Standard Oil Company had transformed the "universal competitive system" that characterized the oil industry in 1870.\*^

Rockefeller was fortunate to find a man like Gates to develop "wholesale philanthropy" for him. As Junior and other officers of the Rockefeller foundations readily admitted, Gates was the source of most strategic ideas, major programs, and important policies in the foundations' first decade and a half, with Junior developing an increasingly important role. In that time there was no serious challenge raised to Gates' dominance. The board of trustees was the final authority, but other staff members knew that if they had Gates' or Junior's support, "we were on safe ground" and would have little problem winning approval from the board.'«

Gradually, however. Gates' influence declined. While the times changed and the much younger Junior became a leader of the growing image of corporate responsibility and concern. Gates' limitations became apparent. Following the 1914 massacre of striking miners and their wives and children in a Ludlow,

## "Wholesale Philanthropy" I 55

Colorado, mining company controlled by the Rockefellers, Junior was held largely responsible by public opinion throughout the nation. But the posture he developed afterward, formulated by consultant W. L. Mackenzie King, made him the leading representative of the new, more benign face of industrial relations that was winning support from many corporate executives. When Junior, who had been called before a Presidential commission created to investigate such problems, claimed he thought it perfectly proper for "labor to associate itself into organized groups for the advancement of its legitimate interests," Gates criticized him for adopting a "spirit of conciliation toward those who came to him in the spirit of these Unionists." Yet it was Junior's support of company unions that was assuaging public opinion and winning the respect of other corporate leaders. Gates did not adapt himself to the changing times.^'

With Gates' leadership passing from the scene, especially following his resignation from the GEB executive committee in 1917, problems of accountability began to be raised. Trustees who had willingly followed Gates now found the foundations without comparable leadership. Other foundation officers had never demonstrated the broad and clear perspective that Gates had shown, and with Gates gone from daily participation in foundation activities, a vacuum was created. Trustees wanted to fill it by increasing their participation. Foundation officers quarreled with one another. The foundations drifted.^ ^

With Gates these problems did not arise because his carefully developed and forcefully presented proposals won immediate support. Gates never expected the trustees to play an important role in social innovation. When a trustee suggested that GEB members were appointed to throw new light on "the great problem of education in this country," Gates impatiently explained that he and Rockefeller gave an "overwhelming preponderance to business men" in composing the board "to fix the policies of this Board along the lines of successful experience." They knew, he said, that "successful business men would steer the ship along traditional Hnes and would not be

carried out of their course by any temporary breeze or even by hurricanes of sentiment."^^ The trustees were there to assure in perpetuity that Rockefeller's money would be judiciously applied to preserving the system and strengthening it, letting professional educators

## 56 I "Wholesale Philanthropy

promote innovative ideas while the trustees supported only those directions which seemed desirable and whose consequences were more certain.

Though Gates ran the GEB with firm leadership and a fiery tongue during his tenure as chairman, he and Junior both wanted the other trustees to take an active interest in the foundation. Without involvement, their interest and sense of responsibility for the fortune would decrease—the very thing to be avoided. "In the remote future," Junior advised his father, "you must of necessity trust to the character and integrity of the men who come after you."^^

It was clearly just as important to encourage local communities to take "responsibility for self-help." Gates' reasons for this guiding principle were moral, tactical, and strategic. He believed in the moral precepts of self-reliance and self-discipline. He also wanted to enlist the active participation of property owners in community institutions. Although they were not as reliable as the men appointed to the Rockefeller foundations, the local ruling classes recognized, as did he, that "the right to earn and hold surplus wealth marks the dawn of civilization."^^ Gates, Junior, and Rockefeller all understood that to fund a local institution without requiring contributions and participation from local men and women of wealth would be to lessen these people's sense of responsibility for what goes on in the institution. They had a genuine concern for the preservation of their society, and its preservation required the active involvement of all those who had a stake in it.

Rockefeller's involvement with the University of Chicago is a good example of this principle in action. Rockefeller contributed \$35 million to the university during its first two decades compared with \$7 million from all other donors. He was consulted about appointments to the board of trustees and approved the initial Hst before it was finalized. But thereafter Rockefeller did not desire to control the university, as many people charged. "He prefers to rest the whole weight of the management on the shoulders of the proper officers," Gates wrote the university president on behalf of his boss in 1892. "Donors can be certain that their gifts will be preserved and made continuously and largely useful, after their own voices can no longer be heard, only in so far as they see wisdom and skill in the management, quite independently of

## "Wholesale Philanthropy" I 57

themselves, now." Rockefeller's trust in the management was well founded. There is no evidence that he ever tried directly to influence the university administration to fire teachers who expressed radical views. It was University of Chicago president Harper who took the initiative to drop Professor Edward Bemis after he made a speech, following the 1894 Pullman strike, critical of the railroads. Rockefeller and Gates had merely appointed the "right" men to manage their philanthropic and financial enterprises, men who were led by values and considerations similar to their own and who could be counted on to do what was expected. In many ways, local authorities in whom Rockefeller placed his trust proved the correctness of this rule.^^

One final and important tactical reason for securing local involvement was to multiply the impact of each grant. The Rockefeller foundations required virtually all recipients to raise an amount equal to, or as much as four times greater than, the grant being given by the foundation. Besides being chosen for their stabilizing influence, foundation trustees were also chosen for "the prestige and authority of their names." Andrew Carnegie, Long Island Railroad president Wilham H. Baldwin, Harvard president Charles W. Eliot, Johns Hopkins president Daniel Coit Oilman, publisher Walter Hines Page, banker Oeorge Foster Peabody, and other prestigious individuals were appointed to the OEB to "secure general public approval and active and powerful public cooperation" for OEB programs. In gaining public support and in requiring matching contributions from others, the foundation was able to multiply the impact of the grant programs. By 1925 the OEB had given \$60 million to the endowments of colleges and universities in the United States for certain reforms they deemed desirable, and they had, by their matching-grant policy, required the institutions to raise an additional \$140 million to support

these OEB-required changes. By 1928 the Oeneral Education Board had contributed some \$50 million to medical schools for very specific reforms,\* generating total resources estimated at ten times that amount for those same reforms.^ ^

Thus the Rockefeller philanthropies, under the guidance of skilled managers, developed self-consciously strategic programs

\*This program is described in detail in Chapter 4.

## 58 I "Wholesale Philanthropy"

to transform higher education and medical care, among other social institutions. The thrust of their programs was to systematize and rationalize these institutions to make them better serve the needs of corporate capitalism.

The rise of industrial capitalism brought with it many new needs that provided opportunities for groups besides the capitalist class. The work process was reshaped to reduce the costs and increase management's control of production. Scientists developed the basic understandings on which technological innovation was based. Engineers adapted scientific knowledge to production, designing new methods and machines that reduced the need for skilled workers, increased productivity, and generally gave management more complete control of the entire production process.

A new stratum of managers and professionals emerged in the society's class structure to design and organize production and the institutions that reproduce and control capitalist society's social relations. Colleges and universities became the training and research agencies, producing knowledge and reproducing engineers, scientists, lawyers, teachers, and other technicians and social managers. Managers were well paid for their efforts, and some, like Gates, were incorporated into the highest circles of the owning class. But despite their separation from predominant ownership, managers of corporations and institutions alike "still think and act as though the firm belonged to them," as William Appleman WiUiams put it.^\* Their commitments to the prevailing economic system are complete.

Out of an earlier mercantilist philanthropy grew a new corporate philanthropy, intended not to ameliorate the lot of industrial capitalism's victims but to shape and guide social institutions. Foundations were, and still are, important ramparts through which private wealth, acting through creative and loyal managers, influences and often controls universities, medical schools, and other "public" institutions. The Rockefeller foundations established directions and strategies that other foundations followed. Gates led the Rockefeller philanthropies with his "imagination, daring, and an intuitive sense of educational strategy."^ ^ Pritchett, following Gates' leadership, made Carnegie's foundation an engine of social transformation. In many

## "Wholesale Philanthropy" I 59

ways, Gates, Pritchett, and other managers understood the workings and needs of capitaHsm better than the ostensible owners of the system did.

Broad social transformations, however, require the participation of more than the ruling class. While the working class suffered greatly from the capitalist reorganization of production, some groups attached themselves to the ascending corporate class and benefited greatly. New occupations, like engineering and social work, and old ones, like law and medicine, gained elevated professional status in return for becoming the new order's managers of production or social relations. Medicine's almost fantastic transformation from rank ignominy to Olympian heights of status exemplifies the powerful consequences of an interest group adapting itself to the needs of the dominant class.

# Scientific Medicine I: Ideology of

## Professional Uplift

Throughout the nineteenth century the medical profession was almost constantly frustrated in its attempts to gain public confidence and raise professional incomes and status. Despite varied attempts to alter the competitive market economy for medical services, the dominant portion of the profession continued to be plagued by competition within its own ranks and from those beyond the pale of orthodoxy.

In this chapter we will see how the rise of science in the latter part of the century provided the solution that medical reformers had previously sought in vain. Physicians and biological researchers consciously applied the methods and principles of scientific research to problems of disease, though even in the 1860s their work had little support and played a very minor role within the medical profession. At about midcentury, however, leading reformers among elite medical practitioners took up "scientific medicine" as the ideology of professional reform and uplift. Medical science gradually provided practitioners with a somewhat more effective medical practice, enabling them to increase their credibility with the public and reduce economic competition within the profession. "Scientific medicine" was adopted as the unifying theory that enabled the dominant profession to develop strong political organization and to win political and financial

support from wealthy people in society. Perhaps most fundamental, the association of medicine with science won support from the new technical, professional, and managerial groups associated with the growth of corporate capitalism.

## AMERICAN MEDICINE IN THE 1800s

In 1800, nearly all American physicians received their training as apprentices at the side of a practicing physician, assisting with simple techniques and mixing medications. In the eighteenth century, medical lectures had not been widely available in this country, so young men from the upper class went abroad for their medical education, especially to Scotland. The handful of Edinburgh-trained physicians in America developed very successful practices, with the wealthiest citydwellers for their clients and lucrative consulting practices besides. By 1800 only about a hundred American physicians had attended medical courses at Edinburgh, and only three American medical programs—at Pennsylvania, Harvard, and Dartmouth—were offering lectures to supplement the apprenticeship. The graduates of these institutions formed a medical elite, and together with the rank-and-file apprentice-trained physicians they formed the self-styled "regular" profession.^

But most Americans were probably not getting their medical care from "regular" physicians. Whereas most of the populace lived in the countryside or small towns, most apprentice-trained doctors and the few medical school graduates lived in the large towns and cities. In Virginia, by 1800 the eleven largest towns had only 3 percent of the state's population, yet 25 percent of all physicians known to have practiced in Virginia during the eighteenth century lived in those eleven towns.^

Most Americans, when they were sick, consulted herbal practitioners. These empirical healers had no formal training but apprenticed mainly with other herbalists. Some of the herbalists were midwives, and others were men and women who had experimented with herbs and were known for their abilities to heal the sick. Lay healers were distributed throughout the countryside. They seldom relied on healing for their entire support and charged little for their services.^ Regular physicians were increasingly plying their art on a full-time basis and charging

## 62 I Scientific Medicine I

substantially higher fees, often supported by medical societies' publishing "fee bills" to place a floor under competing doctors' charges.

The maldistribution of regular physicians and their higher fees were only two reasons why the regular profession was widely unpopular in the first half of the nineteenth century. Very much related to their social, economic, and geographic separation from the populace, the orthodox profession's clinical practice was greatly feared by much of the population. Not only did medicine offer little hope for curing disease, but the heroic methods used by regular doctors were unpleasant and often lethal. The lancet was the physician's indispensable tool for nearly every ailment. Benjamin Rush, the most prominent physician in America from the Revolution through Jefferson's time, urged bleeding for yellow fever "not only in cases where the pulse was full and quick, but where it was slow and tense."\* When bleeding was not recommended, and even when it was, calomel (chloride of mercury), jalap, or another purgative was administered. The violent vomiting and purging that resulted were more detested than even the pus-filled blisters induced as another form of therapy. After attacking the body as well as the disease with bleeding, blistering, and purging, the physician administered an arsenic tonic to restore the weakened patient's vigor.

Against this distasteful and frequently disastrous treatment by regular physicians, the empirical herbahsts' mild treatments were pleasanter and at the very least did not interfere with natural rates of recovery. Their mild emetics and stimulants seemed closer to nature than the regulars' profuse blood-letting and harsh purges.^

Still experiencing competition from the empirically grounded herbalists, regular physicians resorted to ever larger doses of their therapies through the first half of the nineteenth century. Believing that any desired change in a patient's gross symptoms was to the good and seeking to distinguish their art from lay practice,

regular doctors bled their patients more profusely and doubled and tripled their doses of calomel and jalap. The profession's heroic therapy became the focus of increasingly bitter and widespread attacks. Thomas Jefferson called them an "inexperienced and presumptuous band of medical tyros let loose upon the world." By the middle of the century cholera victims were given an even chance of being done in by the disease or by

## Scientific Medicine I I 63

the doctor. The profession's fearsome and futile methods reduced public confidence in regular doctors to an all-time low.<sup>^</sup>

Leading local and regional members of the profession tried many methods of increasing public confidence in doctors and reducing competition. At various times during the nineteenth century, they sought licensing laws, formed new medical sects, started medical schools and issued diplomas, organized state and national medical societies, demanded medical school reforms, and adopted codes of ethics, all with little or no improvement in technical effectiveness, credibility with the public, or their own status and fortunes.

## LICENSING

Despite the antipathy of much of the populace, regular doctors at the end of the eighteenth century persuaded fellow gentlemen in the state legislatures to pass medical licensing laws to restrict or prohibit practice by herbal healers. Licensure bestowed exclusively on regular physicians the right to sue for fees. The legally sanctioned economic privilege did not provide the regular profession with an economic monopoly, but it did set them apart from and above lay healers and most other Americans.

In addition to the public's lack of confidence in regular physicians' clinical methods, populists in the Jacksonian era articulated their opposition to any form of class privilege. By 1850 medical licensing laws were repealed in nearly every state through the efforts of the Popular Health Movement, a loose populist movement of lay healers, herbal practitioners, artisans, farmers, and working people who fought to remove the legal sanctions that protected the privileged position of physicians."

## MEDICAL SECTS AND MEDICAL SCHOOLS

The humiliated profession was badly divided. Many physicians, critical of heroic medicine, were attracted to the pleasanter new professional sects, such as homeopathy and eclecticism, that were growing in popularity. These sects built their materia medica around herbal drugs or some distinctive technology or procedure, each adding elements that enabled them to claim the necessity of extended study in their field.

## 64 I Scientific Medicine I

Homeopathy, as formulated by its founder Samuel Hahnemann (a German physician), was based on the widely accepted medical view that the symptoms of a disease constitute the disease itself and, a corollary, that eliminating the symptoms constitutes a cure. Hahnemann found that some drugs produced the same symptoms in a healthy person (that is, caused the "illness") that they eliminated in a sick person (whom they "cured"). For example, he found that cinchona bark, at the time used to relieve the symptoms of malaria, produced malarial symptoms in a healthy person. From these observations he developed what he called the law of similia similibus curantur—or "like cures like." Hahnemann also maintained that diluting the dosage of a drug down to one ten-thousandth or one-millionth of its original strength increased the drug's potency.\*

Competition between the sects and the lack of decisive public support for any one of them, left none of the sects in a position to establish control through licensing. The orthodox profession and the other sects turned to medical education and degrees as a method of recruiting and certifying new physicians in their ranks and uplifting the profession. Medical schools proliferated throughout the country, and some 400 were founded between 1800 and 1900.<sup>^</sup> Local physicians organized schools to supplement their practices with lecture fees paid by medical students and, through their graduates, to fatten their incomes with increased consultations. At a time when physicians considered \$1,000 to \$2,000 a year a good income, the average part-time medical school faculty member earned more than \$5,000 annually from student fees and private practice while more

enterprising and popular colleagues earned at least \$10,000.<sup>^</sup><sup>o</sup> Like hundreds of general colleges started before the Civil War by rival Protestant sects and political groups, many medical schools were started by rival medical sects to improve their competitive position vis-a-vis other sects. The orthodox profession controlled by far the largest number of schools.<sup>^^</sup>

The proliferation of medical schools in the 1800s assured the dominance of diploma-carrying regular doctors over lay healers and physicians of other sects. By 1860 regular physicians outnumbered other sectarian doctors ten to one.<sup>^^</sup> The inexpensive and widely dispersed medical colleges encouraged large numbers of young men and some women to attempt careers in medicine.

## Scientific Medicine I I 65

Graduates, many of them from yeoman farming and working-class families, filled the cities, towns, and countryside of America. Elite\* regular physicians resented the competition within the dominant sect, but they saved their most venomous denunciations for competing sects. The sectarian doctor was "the greatest foe to the medical profession," argued the dean of the Tulane University medical department, because he was "an obstacle to the financial success of the respectable medical practitioner."<sup>^^</sup>

As the number of physicians increased, organized doctors became increasingly worried. It was clear to all physicians that producing a lot of doctors would lower rather than raise the status and incomes of the profession as a whole. Lacking the public support necessary for effective medical licensing laws and still smarting from the humiliating defeat of medical licensing earlier in the century, the reformers turned to medical school reform. Raising medical school standards and thereby reducing their enrollment, medical reformers believed, would simultaneously win public confidence in medical practice and reduce the output of doctors. The problem they faced was how to control the independent, proprietary medical schools.

## MEDICAL SOCIETIES

Local and state medical societies, representing the practitioners, fought with medical schools in their areas. In 1847 the societies banded together to form the American Medical Association (AMA). At the founding convention, leading practitioners passed resolutions that sought to raise requirements for preliminary education prior to admission to medical school. So few Americans had the requisite education at the time that enforcement of these standards, according to historian William Rothstein, "would have closed down practically every medical school in the country, and would have depleted the ranks of formally educated physicians in a few years."<sup>\*\*\*</sup>

From its founding onward, the AMA was hostile to the interests of proprietary medical colleges and their faculties. The practitioners wanted to reduce the output of medical schools in

\*The term "elite" refers somewhat loosely to physicians who, by their reputations for clinical or research techniques, by income, and/or by organizational leadership positions, had achieved prominence within the profession.

## 66 I Scientific Medicine I

order to reduce competition within the profession, while the medical faculties opposed any attempted reforms because of their interests in maximizing their lecture fees and future consulting fees. Unfortunately for the practitioners, the reform leadership mistakenly thought that including medical schools in the new national organization would allow the medical societies to control them. This strategic mistake immobilized the AMA as the vanguard of practitioners' interests until 1874 when medical college voting rights in the association were abolished.

## CODES OF ETHICS

The AMA's attacks on medical education and especially on other medical sects were supported by a "code of ethics" adopted at their first convention. With the code the AMA hoped to deny the ability of patients to judge

their physicians or disagreements between physicians, to encourage attacks on "irregular" doctors and "quacks," and generally to reduce competition among regular physicians. At the same time that the AMA complained about the low standards of medical education, the association commanded patients to trust their doctors. "The obedience of a patient to the prescriptions of his doctor should be prompt and implicit," the code of ethics instructed. The patient "should never permit his own crude opinions as to their fitness to influence his attention to them."^^

These efforts to bolster the profession's falling economic status and power were legitimized on moral and ethical grounds by the medical societies. Since the colonial period, violation of "ethical codes" had been grounds for ostracizing nonconforming physicians. Codes were used not only against other sects and lay healers but against members of the regular profession who consulted with homeopaths and eclectics and even against the developing medical specialties which offered competition to the general practitioners. The AMA code failed to win public support or stamp out competition although the medical societies' attacks on members for code violations intimidated some doctors and increased intraprofessional antagonisms.'

In short, conflicts between practitioners and medical faculties, generalists and specialists, and "regular" physicians and other sects kept the profession badly divided throughout the nineteenth century. The incoherent strategy of the regular profession's

## Scientific Medicine I I 67

leadership and the weak structure of their organization, the AMA, left the field with no sect able to secure undisputed control over the competitive marketplace.

Medical school output continued unabated. By the end of the nineteenth century, the United States averaged one physician to every 568 people. ^^ Compared with prevailing ratios in European countries (Germany, with one doctor to 2,000 population, was the favorite example), the United States was "overcrowded" with physicians. Physicians' incomes ran the gamut from poor (\$200 a year) to wealthy (as much as \$30,000 a year for a small number of elite doctors). The chief complaints of the most prominent professional spokesmen by the end of the century were the "surplus" of doctors, "low" incomes, and the low social status of the profession.

Three underlying problems plagued medical reformers who tried to heal these wounds. First, physicians lacked an agreed upon technical basis for settling among themselves disputes between the sects. Without public consensus on technical criteria of effectiveness and validity, all sects competed for business in the medical market. But without sufficient public confidence in the validity of any one sect, no sect could win a monopoly of medical practice and thereby eliminate the competition.

Second, their lack of a technical basis for establishing public support put them all in a weak position to establish political control over entry into medical practice. Earlier efforts to use licensing ended in humiliating defeat for the regular profession because of organized opposition from other sects and a distrustful public.

Third, within at least the dominant sect different economic interests divided those who practiced medicine from those who trained future practitioners. Practitioners wanted to restrict the supply of physicians, and part-time faculty wanted to preserve institutions that were lucrative additions to their own practices.

## INCOMPLETE PROFESSIONALIZATION

Without actually having public confidence in their technical ability, physicians throughout the nineteenth century and earlier had nevertheless proclaimed norms to support their authority over the lay public. Demands for recognition of the regular profession's technical competence (in which they undoubtedly

## 68 I Scientific Medicine I

believed) were the means of legitimating their claims to professional authority. The recognition of that authority, however, was seen as necessary to the profession's controlling the economic conditions of its work. By proclaiming a set of norms and values associated with their work, regular physicians hoped to end the

competitive market for medical services and to win a regulated market for themselves.

The basis of professional status and power is still debated by sociologists, who traditionally have posed a set of essential features that are supposed to distinguish professions from the general run of occupations. In 1928, A. M. Carr-Saunders, the father of the sociology of professions, defined a profession as an occupation: (1) based on specialized intellectual training or study, (2) providing a skilled service to others, and (3) in return for a fee or salary. ^^ Thirty years later, William Goode stressed prolonged specialized training in a body of abstract knowledge and a collectivity or service orientation as the "core characteristics" of professions.^^ The list of formal characteristics of professions has been extended by other sociologists to include a systematic body of theory, acceptance of the authority of the professional by all who come to him or her as clients, protection of the professional's authority by the political community, a code of ethics to regulate professional relations, and a set of values, norms and symbols that build solidarity among the profession's members.^°

However, lists of formal characteristics turn out to be fairly useless in the real world in distinguishing professions from other occupations. Even worse, they tend to gloss over the political and economic dynamics that are essential to the process of professionalization, making professional status and power appear an inevitable and desirable feature of modern societies. In reality, as Eliot Freidson has observed, any occupation wishing professional status creates a systematic body of theory, claims exclusive authority of its practitioners, adopts a code of ethics, tries to build solidarity among its practitioners around formal values, norms, and symbols, and otherwise cloaks itself with the well-known medallions of professions to support its claims. "If there is no systematic body of theory," Freidson argues, "it is created for the purpose of being able to say there is."^^

The commitment to service, argues Harold Wilensky, is "the pivot around which the moral claim to professional status

Scientific Medicine I I 69

revolves."" Like many such professional norms, there remains no clear evidence that a service orientation is in fact strong and widespread among professionals. In reviewing the sociological literature that makes such claims, Freidson has concluded: "the blunt fact is that discussions of professions assume or assert by definition and without supporting empirical evidence that 'service orientation' is especially common among professionals."^^

Indeed, many academic social scientists have been beguiled by their own (usually self-serving) beliefs in "science" and "expertise" into confusing professional norms with the reality of professional practice and motivation. Codes of ethics were accepted by some sociologists as genuine efforts by the profession to guarantee competence and honor. Carr-Saunders believed that "if the foundations of the codes were better understood, they would not be generally regarded with hostility."^^

More recently, some sociologists have approached professional norms more critically. Everett Hughes, for example, argues that the widespread acceptance of norms, like the professional "should have almost complete control over what he does for the client" and "only the professional can say when his colleague makes a mistake," have been used by professionals to hide mistakes. ^^

What much of the sociological literature ignores in examining the process of professionalization is how essential political power is in gaining and maintaining professional status. As the history of the medical profession in the nineteenth century demonstrates, without sufficient political power the profession remained unable to control its economic and working conditions. Initial efforts at licensure were defeated by a popular movement of lay healers and other Jacksonian-era populists. Attempts to use medical education as a strategy of reform were thwarted by the organized profession's lack of control over medical schools. The leading reformers organized a national professional association, but the medical school faculties were beyond the reach of the American Medical Association. Ethical codes, articulating prevailing professional norms, failed to win public support for the profession and could not overcome intraprofessional competition. What the medical reformers sought was the power to enforce the instruments of professionalism that assure high incomes, social status, and continued prosperity for the profession.

Freidson is adamant in this interpretation of professionalization. "Not training as such, but only the issue of autonomy and control over training granted the occupation by an elite or public persuaded of its importance seems to be able to distinguish clearly among occupations," he argues. "And the process determining the outcome is essentially political and social rather than technical in character—a process in which power and persuasive rhetoric are of greater importance than the objective character of knowledge, training, and work." The nature of training, as well as the service ideal, ethical code, and body of abstract theory constitute a profession's "ideology, a deliberate rhetoric in a political process of lobbying, public relations, and other forms of persuasion to attain a desirable end—full control over its work."<sup>^</sup>

The history of medicine, from this perspective, can be understood as a political process in which the specific reforms— however much they may increase the technical effectiveness of physicians—are also instruments of persuasion and symbols of legitimacy. The goals of reform leaders were to gain collective control for the profession over its working conditions and economics in order to establish a hierarchy of authority and power among healing occupations, to assure that physicians reign firmly at the top of the hierarchy, and to assure them as high incomes as possible in any given historical period.

Support for such interests would have to come from outside the profession. While efforts were made to win the credibility of "the public," leaders of the profession did not see their struggle as a grassroots campaign. Seeking a social and economic position above the majority of the population, they could at best hope for the acquiescence of the people. Active support would have to come from the already higher social classes. In the eighteenth century, practitioners had turned to gentlemen farmers and wealthy merchants in the state legislatures to protect their interests. In the nineteenth century a political rebellion from below demonstrated the insufficiency of merely legislated sanctions. Furthermore, political power increasingly rested in a new class in society—those capitalists who controlled great manufacturing and marketing enterprises. These were the men who, for good or bad, were changing the face of the nation. Around their enterprises grew the great cities. From their factories

steel and machines that enabled the same men to unify the country commercially with railroads, products, and even armies. From their corporations came the demand for foreign resources and the products for foreign markets that were rapidly making America a world power. This was the ascending class in America at the end of the nineteenth century. Those groups in society who connected with their enterprises or their interests could rise with them.

It became clear to increasing numbers of physicians that the complete professionalization of medicine could come only when they developed an ideology and a practice that was consistent with the ideas and interests of socially and politically dominant groups in the society. It was desirable that everyone in society recognize their technical effectiveness, but it was essential that the classes and groups associated with the ascending social order believe in their efficacy. The development and increasing dominance of scientific medicine within the profession provided the virtually perfect material and ideological basis for an alliance of the medical profession with other professionals (mainly engineers and lawyers), corporate managers, and all ranks of the capitalist class. The medical profession discovered an ideology that was compatible with the world view of, and politically and economically useful to, the capitalist class and the emerging managerial and professional stratum.

## MEDICINE AS SCIENCE

Medical research was flourishing in Germany and France during the nineteenth century, and even in the United States biologists and physicians made their contributions. In 1818 Valentine Mott, a New York physician, was among the first to attempt major arterial surgery near the heart. Other Americans also attempted new surgical procedures while some physicians contributed new understandings to internal medicine. The New York Academy of Medicine, founded in 1847, and the Pathological Society in Philadelphia promoted discussion of medical research and science.<sup>^</sup>

Few of the findings and developments in medical research were directly useful in improving medical practice. It

is doubtful that many patients survived the new surgical techniques in the

## 72 I Scientific Medicine I

absence of aseptic practices. While the differentiation of diseases made observation more precise, the usual heroic treatments were just as likely to do the patient in as before.

Beginning in midcentury, medical research in Europe started producing more applicable findings. In 1858 Rudolf Virchow unveiled a general concept of disease based on the cellular structure of the body. From the findings of cell physiology, anatomy, and pathology, Pasteur, Koch, and other medical researchers developed new concepts and applications of bacteriology.<sup>^^</sup> In the last quarter of the century specialized German laboratories began to replace the more generalist botanists, biologists, and physicians. Their findings gave medical science a more reductionist and technically more effective turn.

Changes in American medical practice reflected the gradual acceptance of recent developments in Europe. Starting in the 1870s, American physicians flocked to the famous laboratories of German and Austrian universities for a year or more of study—if they were ambitious and could afford the expense of travel and living abroad without income. Between 1870 and the outbreak of World War I in 1914, about 15,000 American physicians studied medicine in Germany alone.<sup>^^</sup>

While most American doctors who studied in Europe returned to develop lucrative private practices, a few put their main energies into developing laboratory medical sciences in the United States. Carl Ludwig's physiology institute in Leipzig produced several luminaries of America's infant medical science. Henry Pickering Bowditch, one of Ludwig's pupils, founded the country's first experimental physiology department at Harvard University in 1871. William Henry Welch, another of Ludwig's pupils, started America's first pathology laboratory at Bellevue Hospital medical school in 1878.<sup>^o</sup>

Fifteen years later American medical science came of age with the opening of the Johns Hopkins medical school, modeled after the German university medical schools with a heavy emphasis on research in the basic medical sciences. At Hopkins, for the first time in the United States, the laboratory science faculty were to be full-time teachers and researchers, supported by salaries adequate to live on and unencumbered by the distractions of private practice. Virtually the entire Hopkins faculty was trained in Germany. Hopkins, and then Harvard, Yale, and Pennsylv-

## Scientific Medicine I I 73

nia, became the indigenous producers of scientific medical faculty. As scientific medicine gained increasing acceptance, medical schools throughout the country vied for Hopkins graduates to add gleam to their lackluster local faculties.

Medical practice likewise began to change with the increased acceptance of medical science. Physicians began introducing into their work those scientific medical practices that were uncomplicated and acceptable to their patients and at least seemed effective in reducing suffering and ameliorating the symptoms of disease.<sup>^^</sup> The use of bleeding and calomel began falling off in the 1870s though many physicians continued to use them on a more limited basis as late as the 1920s.

Physicians who had the money to take an extra year's study in Europe were able to build more prestigious practices than the ordinary American-trained doctor. Usually they would take themselves out of direct competition with the majority of physicians by specializing in gynecology, surgery, ophthalmology, or one of the other new branches of medicine. They quickly formed a new elite in the profession, with reputations that brought the middle and wealthy classes to their doors.<sup>^^</sup>

As the base of scientific medicine spread out to include more practitioners, the peaks of elite physicians rose even higher. They quickly found that "scientific medicine" not only seemed more effective than the heroics of old, it was also far more profitable.

Professional leaders had tried numerous ways of uplifting the profession during the nineteenth century, but none of them had succeeded. It was medical science that provided the key to professional reform. Medical research yielded new tools of understanding and held out the hope of more effective techniques of prevention and treatment than orthodox medicine offered. But scientific medicine was utilized by professional leaders beyond merely increasing the technical effectiveness of their practice. It became as well the ideology of professionalization, used to gain support from the dominant groups associated with industrial capitalism, to cement the complete dominance of health care by the medical profession, and to raise the incomes and status of physicians as a group.

The obvious advantages to the profession notwithstanding, scientific medicine contained within it the seeds of ultimate destruction for the profession. The remainder of this chapter and

## 74 I Scientific Medicine I

the rest of this study will examine how this dialectic played itself out—the benefits the profession derived from the adoption of scientific medicine, the contradictions inherent in this historical process that began to undermine the position of the medical profession, and the new forces and contradictions that are now emerging.

### GAINING PUBLIC CONFIDENCE

Scientific medicine solved two broad problems the medical profession faced in the late nineteenth century: lack of public confidence in the effectiveness of their service and competition within the medical profession.

Rather than inspiring awe and confidence, the regular medical profession had won the public's fear and ridicule. To win public support and patronage was the major task set by professional leaders during the nineteenth century. The AMA's code of ethics sought to assure the lay public that doctors were ethical and competent and attempted to command the public to place their confidence in regular physicians. But no claims or commands were effective in the absence of convincing personal experience or persuasive propaganda that could substitute for personal experience.

While homeopathy, eclecticism, and osteopathy did not have as much public patronage as the regular profession, they had a strong base of support. They had a following, including many wealthy and influential people, who believed in their absolute effectiveness. Their practitioners were widely believed to be, relatively at least, as effective as and certainly less dangerous than most regular doctors. And they did not demand a monopoly of practice, a wise and practical political course given the disreputable condition of the profession and the almost universal reliance on home remedies for most minor acute and chronic ailments.

For the regular profession to win in their competition with the other medical sects, they needed first of all to gain absolutely and relatively in public confidence. Scientific medicine provided the basis for a concerted and successful campaign to win this public support. The effort never depended on the common folk of America. The campaign for acceptance of scientific medicine was aimed at the wealthy and powerful in society and the new

## Scientific Medicine I I 75

"middle" classes. Both of these groups owed their privileged positions to the intensive industrialization that began with the Civil War. They were particularly attracted to a kind of medicine that shared their industrial culture, their values, their world outlook, and their ideologies. "Scientific management" analyzed the labor process in production into its constituent elements and reorganized them under management's control and for management's profits." In a similar vein, "scientific medicine" analyzed the body into its parts, subjected the parts to the control of scientific doctors, and thereby kept the bodies healthier and more efficient.

The germ theory of disease was especially attractive to both the regular profession and these new industrial and corporate elites. The germ theory emphasized discrete, specific, and external causal agents of disease. It gave encouragement to the idea of specific therapies to cure specific pathological conditions.^^ The payoff for the medical practitioners would be increased technical effectiveness and improved standing in the eyes of the public. That was not the foremost concern of either influential capitalists or medical researchers. These men

(there were hardly any women in their ranks) saw in scientific medicine the possibility of preventing diseases through technological intervention that identified the offending organism and its means of contagion, and attacked the organism at the source or used it to create an immune response within the body. Disease was thus seen as an engineering problem, surmountable with sufficient talent and resources. To the medical researchers the germ theory and discoveries in bacteriology confirmed the value of their craft and assured increased support for their work. For capitalists, bacteriological investigations and the application of the findings opened the possibility of reducing the toll that disease took of society's resources.

The forerunners of scientific medicine, along with practitioners in other medical sects, had already greatly improved the classification of diseases. European physicians had long dominated the field of medical discovery although now and then an American made a contribution. In 1836 William Gerhardt, a physician at Philadelphia Hospital, clinically differentiated typhoid from typhus. But there was little practical benefit from such classifications when no therapy was forthcoming to cure the

## 16 I Scientific Medicine I

condition. Bleeding, purging, blistering, and tonics were the standard bag of tricks available to regular physicians. Homeopaths and eclectics, along with lay healers, used a wide assortment of herbs, and many claimed high rates of cures. By the 1880s the regular profession still had only a few drugs that were widely recognized to be curative: Quinine could save the victim of malaria, mercury could cure syphilis, and digitalis was often successful in treating heart disorders.^^

The field of disease prevention was somewhat more successful. In the eighteenth century wealthy Europeans and Americans adopted the practice of variolation, a somewhat dangerous inoculation against smallpox used in the East for centuries. In 1798 Edward Jenner introduced inoculation with cowpox that was effective and somewhat safer than variolation.^^

By the time of the third major cholera epidemic in the United States in 1866, the notion that cholera was a specific and contagious disease had finally won near-unanimous support from the medical profession, joining the already strong popular belief in its contagion. Medical support for cleaning up the accumulated filth in American cities won the backing of the business class and helped prevent the spread of cholera and the high death rates that had characterized the previous epidemics. The success of this preventive effort was credited to sanitary engineering and brought increased support for sanitation programs.^^

Despite the scant results, leading practitioners and the new class of medical researchers sustained their faith in the eventual success of medical science. The major breakthroughs came from Europe in the 1880s and 1890s. In 1883 and 1884 Edwin Klebs and Friedrich Loeffler isolated the germ involved in diphtheria, a major killer in the nineteenth century. Emil von Behring and his coworkers produced a diphtheria antitoxin in the early 1890s, which although of little significance in reducing the death toll from diphtheria, supported the belief that deadly epidemics that were borne with resignation could in fact be prevented by understanding their causes.^®

These and other discoveries in the 1880s and 1890s were lauded around the world. Medical science benefited with new respect and political and financial support. Success indeed paved the road to fortune. The German government provided laboratories for Robert Koch and Paul Ehrlich. In France popular

contributions supplied a research institute for Louis Pasteur. In England and Japan private philanthropy paid for new medical research institutes.

In the United States private and government support for medical research lagged behind these other countries. Veterinary medicine received help from the Department of Agriculture to stem epidemics that were wiping out livestock investments. Government officials and philanthropists saw little value in researching human disease, as Richard Shryock notes, "partly because of the nature of medical science prior to 1885 and partly because human welfare brought no direct financial return. Hogs did."- Discoveries of the 1880s and 1890s, however, held out the promise that as science uncovered the germs that caused the great pestilences, further investigation would provide not only cures but methods for guarding against infection and for preventing the spread of

epidemics. These expectations guided the lives of medical researchers, but they were also spreading rapidly among the middle classes and those who owned and managed America's new industrial empires.

Medical science rescued the medical profession, in particular the practitioners, from the widespread lack of confidence in their effectiveness. These few but significant discoveries, mostly in bacteriology, increased the belief in the technical effectiveness of the profession as a whole. The actual impact of progress against infectious disease was not nearly so great as its proponents claimed. The arsenal of effective weapons against diseases did not increase spectacularly, but its limited advances did provide the basis for persuading the public that scientific medicine reflected on all members of the profession—practitioners as well as researchers—who had been trained in the theory and methods of scientific medical research.

The slight increase in the effectiveness of the new medicine was embellished in propaganda by the profession and the media. From the 1890s on, popular magazines and newspapers joined the leading medical journals in praising the accomplishments and prophesying the future success of medical science. Articles ridiculing "Popular Medical Fallacies" and extolling the "Triumphs of Modern Medicine" and the "War Against Disease" appeared in many popular magazines as well as professional journals. They portrayed medicine as an "exact science" and the

## 78 I Scientific Medicine I

physician as an inquiring and skeptical scientist who avoids "hasty jumping at conclusions or too-ready dependence upon formulae." ^°

The increased credibility of medicine was important in convincing the public that doctors with scientific medical training had an expertise worth paying for. If doctors could do little more for a patient than an herbal healer or a patent medicine, there was not much point in people wasting their money on expensive doctors' fees. Scientific medicine wrapped the modern doctor in an aura of therapeutic effectiveness, and the limited improvements gave support to that aura. Furthermore, the technical expertise associated with scientific medicine helped to mystify the role and work of the physician more effectively than did older notions of the etiology of disease, unpleasant remedies, and transparent codes of "ethics." Scientific medicine thereby supported the claims of the profession for a monopoly of control over all healing methods. These benefits provided the basis for other gains and were effective in undermining sectarian medicine, midwifery, and other forms of competition.

In seeking to destroy its competitors' hold on the medical marketplace, the regular profession proffered scientific medicine as more effective than "medicine as art" and "sectarian medicine" and "quacks." Not only was it more effective, it was, as each sect before it had claimed, the only truly valid medicine. Scientific medicine was held up as the nonsectarian medical theory and practice—the only one based not on dogma but on verifiable truths." ^ As the only valid medicine, it should be granted a monopoly of practice; "none but men and women who have an interest in scientific medicine" should be allowed to join any county medical society.\* ^ But making the claim was not equivalent to having it accepted.

Folk medicine was still widely used in the United States, particularly in the countryside but also in the cities. Every family had its traditional remedies that were part of the family lore, believed in and passed down from generation to generation. Generally, the young woman's own family's remedies prevailed in her new family." ^ ^ Some of the remedies undoubtedly acted as placebos, but many were certainly effective in providing relief and even cures. Such traditions were effective obstacles to the acceptance of scientific medicine.

## Scientific Medicine I I 79

Most practitioners were also very pragmatic, developing a repertoire of skills and utilizing some new techniques that seemed effective and readily accepted by their patients. These country and city doctors were not much impressed by medical science. They saw it as a tool enabling them to heal more effectively when its claims worked and when its techniques did not require a whole new method of practice.

Robert Pusey, a Kentucky country doctor who practiced in the 1870s and 1880s, used the clinical thermometer, assorted specula, and a syringe. Occasionally, he used the stethoscope although he preferred to place his ear to

the patient's chest. With this simple method he could hear and distinguish most conditions as well as his scientifically trained son could with a stethoscope. He used judgments based on practice, read up on cases in the more concrete and concise medical texts, and distrusted journal articles. The older Dr. Pusey vaguely accepted bacteriology, especially as an explanation for infections causing pus but not generally for infectious diseases. He sometimes used calomel, made and sold his own drugs, did not use patent medicines, and often prescribed strichnine and arsenic as tonics. He practiced surgery in which he used chloroform as an anesthetic and asepsis when the knowledge and techniques became available to him."^"\*

The propaganda for scientific medicine was sure to be effective, but it would take time. John Shaw Billings, a leading medical reformer in the late nineteenth century, observed that doctors whose practices were not interfered with by quacks were indifferent to reforms while those in need of larger practices were more indignant about such competitors. Many quacks had effected cures where science had failed, Billings admitted. But rather than giving him pause in his rejection of any but scientific medical methods, Billings saw it as a tactical problem of persuading the American public that it is in their interests to suppress quackery. The remarkable achievements of medical science were being brought to the public, but, Billings cautioned, "it is necessary to go slowly and allow such evidence to accumulate.""^

The reformers believed scientific medicine would increase the technical effectiveness of the medical profession, and they promoted it as the only effective therapeutic method. Through propaganda they hoped to undermine public resistance to its use,

## 80 I Scientific Medicine I

increase the public demand for it, and thereby force practitioners to join the new "nonsectarian" medicine.

## REDUCING COMPETITION

As scientific medicine won public and professional credibility, it also solved the second and fundamentally more serious problem facing the profession in the nineteenth century: competition.

Plagued by competition among numerous medical sects, between practitioners and medical school faculty, and within the "crowded" ranks of regular practitioners themselves, the profession was saved from its own internal competitive struggles by the triumph of scientific medicine. First, the technical requirements of teaching scientific medicine provided several advantages for the profession's elite. Second, scientific medicine forged new unity in the interests of elite practitioners and medical school faculty. Third, as it gained increasingly widespread legitimacy, scientific medicine undermined the major medical sects. It thereby imposed unity among those sects in their subordination to the dominant forces in the profession. And, finally, medical science made possible specialization which was largely a response to competition within medicine. The overall impact of scientific medicine within the profession was to legitimize control by elite practitioners and medical school faculty.

## TECHNICAL REQUIREMENTS OF SCIENTIFIC MEDICAL EDUCATION

## THE NEW ACADEMICIANS

Making the doctor the purveyor of a broad range of skills within a context of mystified knowledge required extensive and esoteric training. Nineteenth-century medical reformers envisioned the physician as a bedside scientist. Medical practitioners must think and talk like scientists. They must be trained in anatomy, physiology, bacteriology, pathology, pharmacology, and the physical sciences. They must think of health and disease, not holistically as general relationships between bodily systems or

## Scientific Medicine I I 81

between the person and the environment, but in terms of the micro-concepts of physiology and anatomy, bacteriology and cell pathology. These sciences and their reductionist concepts were gradually recognized in the late nineteenth century as the foundations of medical education.

The medical schools of the last century were staffed by practitioners, often very talented men who were heavy on the "art" but less expert on the "science." Increasingly, laboratory science courses were taken away from the local practitioner and given to physicians with special training in the laboratory sciences. The new academic physicians who preferred these laboratory sciences over medical practice prospered with the increased demand for more faculty with training in these fields. Those who could afford to spend a year or two studying in Germany or Austria after medical school had secure, if not lucrative, academic careers awaiting them on their return.

In 1893 Johns Hopkins became the first medical school in the United States to employ these laboratory men full time and to pay them salaries that enabled them to devote all their time and energy to research and teaching. The new full-time organization of the laboratory science faculty was hailed as a great advance for American medical education. It was quickly adopted by other elite schools and gradually became the norm emulated by the average institution. Although the laboratory science faculty gave up private practice incomes of \$10,000 a year and more in return for salaries of \$3,000 or \$4,000, there were more than enough people to fill the demand."

Some of the giants of medical reform, like William H. Welch, loathed medical practice, feared the insecurity of competition among private practitioners, and longed for the opportunity to pursue medical research without the diversions of maintaining a private clientele. Before going off to Europe in 1876 to advance his medical science skills, Welch confided to his sister his fears of trying to set up "by hook or by crook a patronage of some kind." Echoing the pipe dreams of most medical graduates, Welch observed, "it is much finer to hold a chair in a medical college, and to have a salary . . . and to be sought by patients instead of seeking them." His studies abroad would give him a jump on his competitors: "If by absorbing a little German lore I can get a hittle

## 82 I Scientific Medicine I

start of a few thousand rivals and thereby reduce my competitors to a few hundred more or less, it is a good point to tally."\*

The emphasis on scientific medicine thus created unprecedented job opportunities for physicians qua medical scientists. As positions expanded, a core of professionals developed who were more dedicated than ever to seeing medicine as science completely displace medicine as art. These medical scientists' interests and identification were bound up solely with medical schools and not with private practice. As the vanguard of the profession's successful strategy and the recipients of millions of dollars in capital investments in medical research and education, the new medical academicians became the symbol of the new profession. In the 1890s, for the first time in the United States, the medical profession came to exalt the scientist over the practitioner."\*\* Despite their more modest, middle-class incomes, the scientists were the new elite in the profession.

The faculty at the most prestigious schools won their professional reputations on the basis of their research contributions to their fields. The best reputations attracted the best students and the wealthiest patients. In 1903 Wilham Halsted, a famous surgeon on the Johns Hopkins faculty, got \$10,000 for an appendectomy, and his colleague, Howard Kelly, charged \$20,000 for a major operation."\*^ Unlike the old-time medical faculties, whose material interests were enhanced by student fees and referrals from their many former students, the new academicians' material interests were tied to the promotion of medical science. It was in their interests to raise the standards of medical schools and to make scientific medicine the only acceptable theory and practice.

The predominant type of medical school, owned by the faculty and existing on student fees, prospered as long as enrollments could be kept high and costs low. However, practitioners would prosper only if the production of physicians was decreased, reducing competition within the profession. This conflict of economic interests had divided elite practitioners from medical school faculty throughout the nineteenth century. The ascendancy of scientific medicine transformed the old conflict into the basis for an alliance between the scientific medical faculties and elite practitioners.

The interests of the new medical scientists in medical education were thus tied to the dominance of scientific medicine and not to large numbers of students or even large numbers of medical schools. They joined the elite practitioners as the leaders of reform in the profession. Together they gained control of the AMA at the turn of the century and completely reorganized it to make the AMA the profession's instrument of political action as we know it today and to use it and the leading medical schools to alter completely the technical, economic, and social forces within the medical profession.

The technical requirements of developing and teaching scientific medicine sharpened the distinction between laboratory science faculty and practitioners, provided new and expanding job opportunities for medical scientists, and hoisted them to elite and influential positions within the profession. At the same time these developments provided the basis for the alliance between these new elite faculty and the elite practitioners, giving them sufficient power to take control of the profession and transform it.

"fewer and better"

As a professional consensus developed around scientific medicine, the scientific medical faculty and elite practitioners agreed upon "objective" criteria for judging medical schools. The needs of scientific medical education were pretty clear cut. If students are to be trained as medical scientists, they need to be taught the biological and physical sciences, and they need to be taught how to apply the principles they learn in those sciences to the diseases of real people. Experience as well as common sense argued for laboratory courses in the sciences and hospital experience for the clinical application of those sciences: Learning how is at least as important as learning about.

The technical requirements of teaching scientific medicine suggest fairly clear criteria for judging medical schools. If the premise of training scientists is accepted, then any worthy medical program must have adequate laboratory facilities, clinical teaching facilities, and well-trained laboratory and clinical faculty.

While the criteria of what is "adequate" might be (and were)

## 84 I Scientific Medicine I

argued, the standards were set by those who secured positions of power. The AMA became the vehicle for political action within the profession and the larger society. The reformers used the technical requirements of training medical scientists to set standards and then evaluate medical schools according to those standards. With a few exceptions—Johns Hopkins the shining example among them—virtually all nineteenth-century medical colleges were weak when judged by these standards.

Unquestionably, scientific medical education was and is an expensive affair. The capital outlays for laboratories and hospital facilities were beyond the resources of most nineteenth-century and early twentieth-century medical schools. Student lecture fees could not cover the larger salaries for faculty who devoted substantial time to research and teaching, let alone the increasingly widespread full-time salaries for laboratory science faculty. No medical school could exist on student fees and at the same time provide these increasingly necessary medical science programs for their students.

In some states, students who graduated from medical colleges that did not have these programs, facilities, and personnel were barred from taking licensing examinations. Increasingly, state exams were geared to the information and perspectives provided in scientifically oriented schools, and graduates of inadequately equipped schools failed their licensing exams with increasing frequency.<sup>10</sup> Since the schools were supported by students' fees and students had little incentive to attend a school that did not prepare them to pass state board exams, inadequate schools lost out in the competitive market for enrollees and their money. AMA president Charles Reed observed in 1901, "Under the pressure of legal requirements the weight falls with almost fatal force upon the small, private and poorly equipped institutions."<sup>11</sup> The technical requirements of scientific medical education thus brought about the conditions of collapse of proprietary medical schools. As Abraham Flexner later noted, "Nothing has perhaps done more to complete the discredit of commercialism than the fact that it has ceased to pay. It is but a short step from an annual deficit to the conclusion that the whole thing is wrong

anyway.'"

In Chapter 4 we will see how these conditions provided an opportunity for the AMA and capitalist foundations to transform medical education in the United States. For the moment it is

## Scientific Medicine I I 85

enough to note that without sufficient capital and endowments, no medical school could survive in the era of scientific medicine. Schools collapsed and consolidated all over the country beginning in 1905, coinciding with the first year of serious activity by the AMA's new Council on Medical Education. Between 1905 and 1910, thirty schools merged and twenty-one closed down altogether." The number of medical schools declined from a high of 166 in 1904 to 133 in 1910, 104 in 1915, and hit a low of seventy-six in 1929. In the reorganization of medical schools the number of students was reduced at many institutions in order to intensify the teaching and research resources within each school. Thus the technical requirements of scientific medical education were used to close schools and decrease the production of new physicians, easing the competition within the profession and raising doctors' incomes.

Furthermore, scientific medical education "required" greater preliminary education. Students must come to medical school, it was argued, having had a full year each of college chemistry, physics, and biology.

The demands for stringent requirements of preliminary education were not new to the era of scientific medicine. In eighteenth-century and nineteenth-century England, where "physicians" were a tiny elite above surgeons and apothecaries, it was essential for physicians to be regarded as gentlemen. Because they practiced only among the wealthy, it was important to their pocketbooks to be able to mingle with the upper class. As professions developed, a liberal education became the mark of upper-class origins. "It might not make you a gentleman," W. J. Reader has observed, "but without it a gentleman you could hardly hope to be."^^ In the United States as well, a college education was the mark of a gentleman. For those who were not born into a privileged class, a college education—if it could be gotten—"rubbed the raw edge off many a country boy," giving them sufficiently proper appearances to make their way to a higher social class.^

It is not surprising then that substantial educational requirements had been declared an imperative in the mid-nineteenth century because it would assure that doctors would be gentlemen. Daniel Drake, probably the most illustrious American physician of the midcentury, criticized his colleagues' ignorance of Latin

## 86 I Scientific Medicine I

and Greek without which, "whatever may be his genius and professional skill," a physician would still necessarily "appear defective and uncultivated."^^ This persistent concern was echoed by Johns Hopkins' famous Dr. Welch who wrote in 1906, "The social position of the medical man and his influence on the community depend to a considerable extent upon his preliminary education and general culture."^

Elite physicians frequently complained of the "coarse and common fiber" of much of the profession.^ Even a minority of the profession lacking upper-class polish cheapened the status of all doctors. The proliferation of inexpensive proprietary schools enabled a young man to live at home while attending medical school and thereby made medicine a ladder that some farm boys, artisans, and shop clerks could climb to middle-class status and income. It was not only the inadequacies in the training provided in commercial colleges that angered the elite reformers; it was also whom they brought into the profession. Frank Billings, in his presidential address to the AM A in 1903, disdained "these sundown institutions" that provided evening classes and enabled "the clerk, the streetcar conductor, the janitor and others employed during the day to earn a degree."^^

Prior to the acceptance of scientific medicine, attempts to lengthen the medical school term of instruction and raise preliminary education requirements were met with charges of elitism. "There is an aristocratic feature in this movement" by medical societies, Martyn Paine, a faculty member in the New York University medical department, asserted in 1846. "It is oppression towards the poor, for the sake of crippHng the medical colleges."^^

Even after the turn of the century some education leaders warned against excluding the poor from medicine. In 1908, W. L. Bryan, president of Indiana University, criticized the Association of American Medical Colleges' proposed requirement of two years attendance at a liberal arts college prior to admission. Raising the entrance requirement would "shui out of the medical schools thousands of men who are not ignorant nor incompetent" but who would be excluded because "poverty and other hard conditions" have kept them from the colleges.^ ^ The profession's objective was exactly that—to exclude the poorer classes from their ranks.

## Scientific Medicine I I 87

Scientific medicine provided an "objective" basis for requiring a lengthy preliminary education. If students had to come prepared with college courses in physics, chemistry, and biology, then there could be no argument against lengthening the requirements. The standard-setting schools raised their requirements from completion of high school to two years of liberal arts college and finally to a bachelor's degree. From the moment it opened its doors in 1893, Johns Hopkins medical school led the way by requiring a bachelor's degree for admission and four years of instruction for its prestigious M.D. degree. When Harvard instituted the baccalaureate requirement in 1901, its entering medical class dropped from an all-time high of 198 students the previous year to sixty-seven.^ ^ The preliminary education requirements were several steps ahead of the great majority of American youth and enabled the profession to draw its recruits from the "better" classes.

Was this an unintended outcome of the technical "requirements" of medical education, or was it the desired outcome for which scientific medicine provided the mere rationale? Given the goals of professional leaders throughout the nineteenth century—to reduce the numbers of physicians and to raise the social-class standing of the profession—it seems that scientific medicine provided the credible rationale that all previous generations of medical elites had sought in vain. The preHminary requirement would weed out the economically and socially "unfit." Some reformers justified this selectivity by the cost of scientific medical education. "It does not pay to give a \$5,000 education to a \$5 boy," intoned John Shaw Billings in 1886 while helping to organize Johns Hopkins medical training." But most elite physicians simply desired to eliminate "professional degeneracy," as Dr. Inez Philbrick put it at the turn of the century. Philbrick, a successful practitioner in Lincoln, Nebraska, rallied his colleagues to "Let fewer and better be our motto.""^ ^

In sum, the technical requirements of scientific medical education gave new career opportunities to physicians as medical scientists, creating a whole new position of full-time researcher and teacher and a new group of elite medical school faculty who combined a material interest in medical schools with a commitment to promoting scientific medicine. At the same time these technical requirements of the new medical education provided

## 88 I Scientific Medicine I

the standards and the rationale for reducing the output of medical schools and raising the social class base of the entire profession.

## "NONSECTARIAN" MEDICINE UNDERMINES THE SECTS

As scientific medicine gained increasingly wide acceptance, it undermined the other medical sects. Scientific medicine thereby forged unity within the profession by enabling the AMA to subordinate the sects to its own standards of medical education and practice. Overwhelmed by the increased claims of technical effectiveness for scientific medicine, the major sects began incorporating scientific medicine into their own doctrines and practice.

Homeopathy, the most formidable competitor of the regular professions in the nineteenth century, gradually dropped its unique features. Most homeopathic physicians in America broke with pure homeopathic theory in the mid-nineteenth century, taking what they believed valid from regular medicine and discarding especially heroic therapies. They purged the purists from their ranks by founding homeopathic medical colleges, previously believed unnecessary, and requiring training in general medical skills, including surgery.^ ^ Most midcentury American homeopaths were regular physicians unhappy with the ineffectiveness of regular medicine and with its growing unpopularity. In 1849, 1,000 Ohio physicians and lay people, disaffected by the

orthodox profession's inability to relieve suffering during the cholera epidemic, organized a homeopathic society in Cincinnati.^^

The direct competition that homeopathy posed to regular physicians led to campaigns to exclude them from medical societies and hospital privileges. The Massachusetts Medical Society began excluding homeopaths in 1860. By the 1870s there was a general attack, led by the AMA, on homeopathy and other "exclusive systems of medicine." Physicians violated the AMA code of ethics if they consulted with sectarian physicians or female or black doctors. In the 1870s the restrictions against female physicians were rescinded under pressure from the growing women's rights movement, and the exclusion of blacks was relaxed though local medical societies and hospitals openly

## Scientific Medicine I I 89

continued their racist practices. But the attacks on "irregular" doctors continued throughout the century.^"

By the end of the nineteenth century, nearly all homeopaths were using both regular and homeopathic drugs. Leading homeopaths announced that the great majority of homeopathic doctors did not believe in infinitesimal doses, rejected the universality of the law of "like cures like," and generally used drugs like regular physicians. Homeopaths also became interested in clinical specialties. In 1899 the American Institute of Homeopathy redefined a homeopathic physician as "one who adds to his knowledge of medicine a special knowledge of homeopathic therapeutics."^® Homeopathy, as well as other sects, were being overcome by the competition from scientific medicine.

Nonetheless, the continued popularity of homeopathy and eclectic medicine and the incomplete acceptance of scientific medicine made it difficult for regular professional leaders to win exclusive licensing privileges in the states. With the convergence in practice and education of homeopaths, eclectics, and regular physicians, it was possible to assure the dominance of scientific training and politically necessary to ignore, for the moment, the sectarian separations. Only through the combined efforts of the regular and "irregular" profession could laws be secured to restrict medical practice to scientifically trained physicians. The profession's leaders around the country agreed with William Osier, the most eminent American physician of his day, who advised the Maryland state medical society in 1891, "if we wish legislation for the protection of the public, we have got to ask for it together, not singly."^^ And together they asked.

Beginning in the 1870s, state legislatures established medical licensing examination boards. In 1873 Texas passed the first modern medical practice act, a morale-boosting victory to the profession that offset the bitter memories of the Jacksonian era's repeal of licensure. The Illinois Board of Health, the state's licensing agency, was a model for the nation. Beginning in 1880, it began to host American and Canadian medical schools according to qualitative criteria set by the Association of American Medical Colleges, an organization of elite, scientifically oriented institutions. ^°

Nonregular doctors participated in some way in medical licensing in at least thirty-three of the forty-five states that had

## 90 I Scientific Medicine I

enacted licensing laws by 1900. Physicians from at least two sects served on the same licensing boards in twenty states.^' By cooperating in licensure, the nonregular profession won inclusion among the respectable. With scientific medicine gaining ground every year, it appeared to the leaders of homeopathy that they had nothing to lose and everything to gain from their association with the regular profession. The president of the AMA even acknowledged in 1901 that "with broadened and increasingly uniform curricula" it made little sense to argue that competing sects did not share the profession's competence.'-

The reform leaders in the regular profession won the biggest rewards. By cooperating with the nonregular sects, they won licensing laws that recognized scientifically oriented reforms as the only valid basis of medical education. In a short time they secured complete control of licensing and the resources for medical education reform. Whether these elite professionals foresaw their ultimate gain from cooperating with the homeopaths

and eclectics or they were guided by expedience undiluted by strategy, the cooperative licensing efforts hastened the elimination of sectarianism amid the growing chorus of support for scientific medicine.

By 1903 the AMA adopted the strategy explicitly. At its annual convention the delegates voted to eliminate the decades-old exclusion of physicians who were trained as homeopaths or eclectics but chose not to "designate" themselves as such."<sup>^</sup> Two years earlier AMA president Charles Reed had drawn attention to the good effects of allowing all licensed physicians into state medical societies. By ending its exclusionary policy, he said, the New York society had reduced the registration of sectarian physicians by "nearly ninety percent."""\*

Scientific medicine was perhaps more effective than homeopathy and eclecticism in treating some diseases for which it had developed cures, but it was not, particularly at the turn of the century, the panacea it was believed to be. The reformers' overly optimistic assessment is shared by many contemporary medical historians. WiUiam Rothstein, for example, maintains that "sects could survive in medicine only so long as medically valid therapies constituted a smnU part of the therapies used by physicians. Once medically valid therapies became the dominant

## Scientific Medicine I I 91

part of medical practice, medical sectarianism declined markedly.""<sup>^</sup>

In reality the number of medically effective therapies had not increased significantly in the first few years of this century, the period when sectarianism declined in medicine."<sup>^</sup> Rather the campaign to win acceptance for scientific medicine struck a responsive cultural chord among the new technical and managerial groups associated with industrial capitalism and with the media they controlled. The campaign established a popular belief in the broad effectiveness of scientific medicine and, together with political action by elite medical reformers, undermined the medical sects that competed with the regular profession.

## SPECIALIZATION: LESS COMPETITION FOR THE ELITE

Advances in medical science during the late nineteenth century rapidly developed the technical basis for some physicians to offer highly specialized expertise not available from the ordinary practitioner. Medical advances were presumably usable by any physician, but in reality only those who studied a particular area developed the expertise to apply techniques and inventions. The ophthalmoscope, invented by Helmholtz in 1851, required considerable study and practice to know what to look for on the other side of the cornea. Anesthetics, antisepsis, and asepsis made surgery a relatively safer procedure, but the masters of surgical techniques were those who devoted their entire practice to it.

The very existence of medical specialization rested upon a reductionist analysis of the body and disease. Its concrete development was made possible by advances in medical science. Nevertheless, specialization among practitioners was encouraged by economic competition within the profession and grew to take advantage of the new market for more technical, seemingly, more scientific medical services.

With dissatisfaction rampant among more ambitious members of the profession, some 15,000 American physicians studied medicine in Germany alone. They returned to reap the benefits of their advanced training and confidence to specialize in some branch of clinical medicine.""<sup>^</sup> Successful specialists soon earned

## 92 I Scientific Medicine I

more than twice as much as the better-off general practitioners."\* Elite, scientifically oriented physicians saw specialization as a solution for themselves in the competitive medical market.

The demand for specialists grew with the urban upper middle class. Patients whose own social position was based on the growth of technology and industrialization sought out physicians whose practice suggested the same world view. Gynecological theory viewed most female disease as being rooted in or associated with uterine problems. As Barbara Ehrenreich and Deirdre English have amply demonstrated, Victorian femininity itself was associated with invahdism and physical and emotional frailty. Women of the "better" classes were defined as

sick in order to support their role as social ornamentation, demonstrating the financial and social success of their husbands and distinguishing them from lower-class women who were expected to work and were considered sickening."<sup>^</sup>

Gynecological surgeons preyed upon the supposedly delicate nature of upper middle-class women and the terrible consequences of having a "tipped" uterus or sexual appetite. Hysterectomies, ovariectomies, and cliteridectomies were prescribed for these and other female maladies. Some gynecologists, like Horatio Bigelow writing in the AMA Journal in 1885, favored a "conservative" approach over too rash use of the knife or mechanical devices. He believed that better results could be obtained "by attention to every detail of life, even the most insignificant, for the aggregation of the little things go to the making of the big ones, and also, by attention to psychical conditions and reactions."<sup>\*o</sup> Such attention, of course, required daily visits from the doctor.

Gynecologists tailored their medical theories to the prevailing notions of the place of women in society and thereby developed a new and lucrative medical market. Upper-class women became the objects of knife-wielding gynecological surgeons or the invalided captives of overly "attentive" gynecological practitioners. From the early 1890s abdominal and pelvic surgery seemed the profession's own Gold Rush, and surgeons were, in the words of the AMA Journal, "as restless and ambitious a throng as ever fought for fame upon the battlefield."<sup>\*\*</sup>

General practitioners obviously suffered to the extent that their patients went to specialists with complaints the GPs

## Scientific Medicine I I 93

formerly treated. From the 1850s onward, the GP-dominated medical societies attacked what they viewed as unfair competition. In 1874 the AMA's judicial council ruled that specialists could advertise only that their practices were "limited to diseases peculiar to women" or "diseases of the eye and ear." Such restrictions on specialists denied the claims of scientific leaders that specialism was based on greater expertise not available to the general practitioner. Moreover, few physicians at that time could completely limit their practices to specialties since specialization was not yet widely enough accepted.<sup>\*^</sup>

Conditions soon changed, at least in large and medium-size cities. Specialists promoted the medical sciences through their own societies. Following a rebuff by the AMA, which named a committee of medically conservative professionals instead of distinguished medical scientists to host the 1887 International Medical Congress, specialists and other medical scientists formed the Association of American Physicians. In 1888 all national specialty societies formed an alliance outside the AMA in the American Congress of Physicians and Surgeons. In the last years of the nineteenth century, as scientific medicine increased and the economic base of specialism grew more secure, membership in scientific societies increased—particularly in Eastern cities where medical centers were beginning to dominate medicine—while membership in the AMA languished.<sup>\*^</sup>

Medical specialty societies were intended not only to promote development of the specialty but also to gain acceptance of the specialists by general practitioners. Even though they were competitors, specialists relied heavily on referrals from other physicians for much of their practice. Generalists had to be induced to refer their difficult cases to other physicians. To encourage referrals, many, if not most specialists, gave a portion of their fee to the doctor who made the referral.<sup>\*\*\*</sup> Fee-splitting became a widespread practice to control competition and gain acceptance of specialists by GPs.

Fee-splitting, however, was a private tool of individuals used to soften competitive relations among themselves. For fee-splitting to be used collectively by the organized profession would require an open admission of its existence and legitimacy within the profession. That would have been worse than the competition that fee-splitting was attempting to regulate because it was a

## 94 I Scientific Medicine I

purely commercial arrangement that undercut professional claims of expertise and privilege. It thereby reduced public confidence in physicians and further weakened the social and political position of the profession. Fee-

splitting could not resolve conflicting interests between specialists and GPs at the national level.

Ultimately, the development of specialties and subspecialties has indeed reduced overall competition within the medical profession. The ratio of primary care physicians has fallen from more than 170 per 100,000 population in 1900 to less than sixty per 100,000 today.<sup>^^</sup> But the division of physician labor into specialties created intraprofessional problems, pitting general practitioner against specialist. The decline in primary care physicians has eased the problem somewhat, but it was still a serious split in the ranks at the turn of the century and an obstacle to the efforts of the scientifically oriented elite practitioners and medical faculty who led the reform movement.

New levels of accreditation of specialists emerged in the twentieth century. The American College of Surgeons was charged with being elitist and un-American for its efforts to restrict surgery to specially licensed physicians and to accredited hospitals. In 1912 Franklin Martin's public relations tour for the College of Surgeons was interrupted with heckling by hostile GPs. The college fellows were accused either of degrading the profession by forming "a glorified surgical union, along labor lines" or of establishing a new oligarchy, "an exclusive Four Hundred in the profession."<sup>^^</sup>

The reform leadership gathering in the wings of the AMA included many leading specialists, but they saw the importance of putting the interests of the profession as a whole at the forefront of their campaign. After failing in 1898, they succeeded in 1901 and 1902 in their efforts to reorganize the AMA into a more effective national organization. Their strategy included the delicate issue of unifying the competing specialists and general practitioners and bringing the specialists into the profession's main political arm—the AMA.

## GAINS AND LOSSES

Scientific medicine was clearly an effective doctrine for the reform and uplift of the medical profession. It increased the

### Scientific Medicine I I 95

technical effectiveness of doctors, providing a basis for increasing public confidence in the profession. The need for research and the teaching of medical sciences created a whole new category of academic medicine. It united the interests of these academic physicians, who sought total victory for scientific medical schools over less adequate ones, with the interests of elite practitioners, who wanted to reduce production of and competition among doctors in order to raise their incomes and status. The requirements of scientific medical education strained the resources of "commercial" medical education to the breaking point, closing down many medical schools and reducing the production of physicians. It also provided the rationale for requiring extensive preliminary education of medical school applicants, forcing the poorer classes out of medicine and thereby raising the social class base of the profession. Furthermore, scientific medicine undermined sectarian medicine, uniting most of the divided profession under the banner of "nonsectarian" scientific medicine. Finally, it provided a basis for further decreasing competition within the profession through the development of specialization. Thus, scientific medicine helped complete the professionalization of medicine.

These gains to the medical profession were accompanied by some losses. Some of the losses were borne by less powerful members of the profession. The gains of specialists, the new elite among practitioners, were the losses of the general practitioners. Scientific medicine provided the profession's scientific elite with the means of securing its position and taking complete control.

While society benefited from more effective techniques against infectious diseases, people lost the benefits of traditional techniques and became dependent on technological medicine. The propaganda of the reform-minded elite sold scientific medicine as the last word on matters of health and disease. Through their campaign, the medical profession excluded herbal methods of prevention and therapy that are only now regaining popularity. They also narrowed the scope of medical inquiry to reductionist concepts, all but ignoring the social and economic contexts of health and disease.

The doctor was portrayed as omniscient and his skill as all-powerful. Patients, accepting the profession's claims

and wanting something for their money, began to expect their doctors

## 96 I Scientific Medicine I

to provide remedies for their suffering. Not wanting to discourage this profitable attitude, most physicians believed that, in the words of a late nineteenth-century physician, "he fails of his duty and his privilege who neglects to do something for the patient."<sup>\*</sup> However, even this lucrative attribution of physician omniscience was a double-edged sword. Armed with assurances of the near-infallibility of medical science, patients demanded compensation when they were maimed by the therapies or mistakes of scientific doctors. The number of malpractice suits from 1900 to 1915 exceeded the number of suits during the entire nineteenth century.<sup>\*\*</sup>

Naturally, the most oppressed groups in society suffered the most from the complete professionalization of medicine made possible by scientific medicine. The poorer classes in general and ethnic and racial minorities in particular have suffered doubly— by being excluded from entering the profession and by losing medical care that was indigenous to their communities and accessible to them. By the early 1900s people who could afford specialists increasingly relied on them, often by-passing the general practitioner altogether. The poor filled the waiting rooms and examining tables of teaching hospitals to become the teaching and research material for interns, residents, and specialists. The nation's wage earners, excluded from charity clinics by means tests and often unable to afford private specialists' fees, became the bread-and-butter clients of the nonelite general practitioners.<sup>\*</sup> Following the largely successful doctors' campaigns to rid the country of midwives, working-class and rural women and men lost the services that helped maintain the integrity of their famines during the disruption of childbirth and found themselves having to pay the higher fees of physicians and the cost of a hospital bed.<sup>o</sup> Women suffered from unnecessary surgery and suffocating attention from gynecologists. They, like the working class and racial minorities in general, were also excluded from becoming doctors.

The fewer physicians competing for consumers' dollars, the higher physicians' incomes rose and the fewer doctors who practiced in working-class and poor sections of the cities and in the countryside. The middle class became the main source of income for the majority of the profession. As Morris Fishbein, editor of the *AMA Journal*, complacently observed in 1927, "The

## Scientific Medicine I I 97

physician of the future will deal largely with this group. From them most of the physicians, who are themselves of the middle class, will derive their incomes."<sup>^</sup>

The dynamics that lifted white middle-class and upper-class male physicians to the top of a hierarchy were not based on conspiracies or conscious deceptions. Physicians acted in their collective self-interest. While the different interest groups within the profession often clashed, their conflicts were gradually overwhelmed by the growing belief that all who embraced scientific medicine would benefit. Old-time homeopaths and eclectics, of course, fell by the wayside, and proprietors of crassly commercial medical schools lost their lucrative businesses. But most physicians could relate to the purposes of the reform campaign— more respect for their skills, higher social status, more money— and to the necessary means of achieving them. Undoubtedly conspiracies and conscious deceptions occurred along the way (we will see some examples in Chapter 4), but even the reform leaders believed their mission would benefit society as well as the medical profession. Nevertheless, it strains the imagination to conclude that the complete professionalization of medicine served the interests of more than a small minority of the population.

The technical limitations of nineteenth-century medicine were replaced by technical narrowness in the twentieth century; the professional pluralism, by professional monopoly controlled by elite specialists and medical academicians; the culturally diverse and widely distributed group of healers, by a more fully stratified and, for many, inaccessible professional class. These were some, of society's losses that accompanied the profession's gains. The consolidation of a scientific medical profession, however, also provided important gains for the corporate class in America.

## CHAPTER

### Scientific Medicine II: The Preservation of Capital

Scientific medicine, while providing well for the medical profession, also posed a major and unresolvable contradiction for doctors. Medical science, as it developed in capitalist countries, was built up around technology. The higher the level of technology, it was believed, the more effective or, at least, salable were the services of practitioners and researchers. But the higher the level of technology, the more capital was required for medical practice as well as for research. Investments in hospital and laboratory facilities and tremendous expenses for highly specialized faculty and researchers were beyond the resources of physicians themselves.<sup>^</sup> Doctors had to turn outside the profession for capital, and in 1900 there was only one class who had such money. Wealthy capitalists were in a position to dictate terms to the profession—policies that served their own interests as much as or even more than those of the profession itself. In this chapter we will see how medical science opened the door to capitalist intervention and the ways scientific medicine served not only the needs of the medical profession but the interests of capitalism as well.

### MEDICAL TECHNOLOGY AND CAPITAL

The nineteenth-century family doctor owned a few instruments—specula, a thermometer, and a stethoscope for examinations, saws for amputations, a chest of medicines to be sold to

#### Scientific Medicine II I 99

their patients—a small investment indeed. But twentieth-century medicine required greater technology than any single physician could afford. Hospitals, once the institutions to which the poor were taken to die, became the workshop for the doctor. Not only did the hospital provide the doctor with fully equipped operating rooms, x-ray machines, and other diagnostic and therapeutic instruments. It also provided auxiliary personnel who would isolate patients from their families, place them under the control of technical experts, and insure that the doctor's orders were carried out. Just as the buggy carrying the doctor to the patient's house symbolized the nineteenth-century doctor-patient relationship, the patient in the doctor's moderately equipped office and then the doctor and patient in the hospital symbolized the modernized counterparts.

Large-scale development of hospitals in the 1890s followed the development of surgery as a specialized skill. The renowned surgical skills of Halsted at Johns Hopkins and of others at the Mayo Clinic provided popular support for the profession's pleas that hospitals with modern surgical facilities be built. Rosemary Stevens notes, "Most of the hospitals now in existence were founded between 1880 and 1920, and the middle class for the first time entered hospitals on a large scale." In 1873 there were only 178 hospitals in the United States. By 1909 there were 4,359 hospitals with a total bed capacity of 421,000.<sup>^</sup>

Physicians grew increasingly dependent on hospitals. By 1929, seven out of ten physicians had some kind of hospital affiliation. In New York and Chicago, the average physician, whether generalist or specialist, spent as much as 30 percent of his or her time in hospitals and clinics.<sup>^</sup> Even by the turn of the century the medical profession was growing dependent on expensive, institutionalized technology.

The capital needed for hospitals, medical education, and research was beyond the means of the profession itself. A fully equipped, medium-sized hospital was an expensive building project. Then, too, room and service charges could not reasonably be expected to pay for the annual costs of running the hospital, especially when hospitals were free-of-charge workshops for the doctor. Patients could be expected to pay a certain amount for their hospital care, but beyond a very vaguely determined limit, any additional hospital charges would reduce

#### 100 I Scientific Medicine II

utilization and cut into the revenues of both hospital and physician. Thus, each year hospitals accumulated

deficits that had to be paid off.

Deficit financing reflected the social role of hospitals as charitable institutions. Historically, from their development as medieval refuges for the diseased poor to their more recent role of providing for the sick of all classes, hospitals have consistently reflected the class structure of the society. Fitting their position in the class structure, the rich have been expected to pay the complete costs of their own private space and attentive care. The middle classes, with less commodious facilities and fewer staff to attend to their wants, have been expected to pay their own costs but not necessarily to support all aspects of the hospital. The poor, until recently, have been expected to pay in accord with their means, and that has been very little. Their care has been categorized as charity, and, consistent with widespread notions of the importance of work and of the slothfulness of the poor, the facilities and care provided for them have been austere at their best and humiliating at their worst. Furthermore, with the association of increasing numbers of hospitals with medical schools, the poor have become the profession's research and teaching material. To complete the differentiation of class relations reflected within the hospital as well as to balance the hospital's books, the rich have been called upon to give money to the hospital to pay the costs of care given to the poor. The charitable nature of hospitals gives wealthy people an almost perfect opportunity to demonstrate their noblesse oblige within an institution that publicly reflects and thus reinforces the class structure of society.

The organization and financing of hospitals clearly provides physicians with the facilities to practice their profession and make money, and it benefits the upper-middle and upper classes by providing them with facilities consistent with their social status and opportunities to demonstrate their superior class positions through charity to the hospital. The dependence of the medical profession on the wealthy could create antagonism, but with their compatible interests in the hospital, their relationship has been symbiotic. Local wealthy men and women opened their hearts and loosened their purse strings to hospital fund raisers.

Medical research and medical education were different issues. Hospitals appealed to a local constituency whereas the new

## Scientific Medicine II I 101

scientific medical schools drew their students and faculty from at least the state and more often a whole region or even the nation. Medical research was a long-term investment in developing new knowledge and technology that would serve the country as a whole rather than provide a subordinating service to the poor. Medical faculty and researchers were no longer the local physicians of distinction; their reputations were made nationally within their own ranks, or not at all. Local rich men and women could be cajoled into providing a laboratory at their nearby medical school through appeals to local pride, but these objects of charity lacked the drama of hospitals serving the poor and providing facilities for physicians known throughout the local community. Medical education and medical research involved much larger sums of money than hospital construction, and the endowments to support faculty and researchers required still larger investments out of the wealth of the local upper class.

The combination of the larger sums required, the less directly charitable and less visible functions of medical research and education, the long-term investments they represented, and the more national character of their appeal made medical education and medical research the philanthropic objects of a national wealthy class more than of those whose wealth was local in its character or size. By the 1890s a new national capitalist class overshadowed the local business and aristocratic elites.<sup>1</sup> Their wealth was derived from investments in national corporations, and their visions of what was good and necessary for society were broader than their local and lesser counterparts. Many of them gave without strategy in their benefactions, except the courting of good will, but some had strategies and interests of their own.

Just as well-connected local physicians appealed to the local pride and charitable obligations of the local upper-middle class to build a modern hospital for their community, so did academic physicians and medical scientists turn to men and women of broader wealth with appeals to the needs of society. A few illustrious centers of medical education and research were relatively well off. Charles Eliot clearly saw that the way to attract large gifts and endowments was to reform Harvard's medical school. Johns Hopkins willed a hospital and medical

school as well as a general university from his Baltimore and Ohio railroad fortune; yet more was needed and gotten from wealthy individuals to open the medical school. These cases were the exceptions.

102 I Scientific Medicine II

"Not half a dozen institutions have received any considerable sums, and very few anything at all," the AMA Journal complained in 1900. The endowments necessary to "advancing medical education and medical science" must come from outside the profession.^ As some reform leaders foresaw and feared, there was danger in dependence on philanthropy for that capital.

WELCH: A ROCKEFELLER MEDICINE MAN

William H. Welch's personal plight and eventual success are indicative of the rising star of medical research. Returning in 1878 from his pathology studies in Germany, Welch found little support in New York for devoting himself to laboratory research. Although he received mild encouragement from Francis Dela-field at the prestigious College of Physicians and Surgeons, he could not find any space in which to set up a laboratory. Finally, he turned to the lesser-rated Bellevue Hospital medical college and negotiated the use of three rooms, some kitchen tables, and twenty-five dollars in equipment. With frogs gathered from the marshes of his sister's upstate New York home, Welch began the first laboratory course in pathology given in an American medical school. He got by with fees from his six students, a partnership with another doctor preparing medical students for competitive examinations, and assisting Dr. Austin Flint, a rich and socially prominent professor of medical practice at Bellevue.^

Welch's European studies and original work brought him immediate recognition. Within a year the alumni of the College of Physicians and Surgeons contributed enough money to offer Welch a modest pathology laboratory at their alma mater, but Welch felt a commitment to Bellevue and also wanted to hold out for the security and completeness of the chair in pathology at the new Johns Hopkins medical school. Drawn by the "more academic" environment at Hopkins, relief from "the drudgery of teaching," an endowed \$4,000 a year salary and paid assistants, Welch shocked the New York medical profession and friends by giving up a future income of "at least \$20,000" for provincial Baltimore."

Welch took the position at Hopkins in 1884. Before going to Baltimore, he spent most of a year studying bacteriology in Leipzig and in Berlin with Koch. He studied bacteriology largely

Scientific Medicine II I 103

because he feared he would be left behind in the growing competition for medical discoveries.^ Welch's singular devotion to his career brought him success. Despite the adulation and social popularity he received, he isolated himself from personal intimacy with any other person, male or female.^

Welch's reputation as a researcher and organizer of research grew even before the Johns Hopkins medical school opened its doors in 1893 with Welch as its first dean. By the turn of the century, Welch's professional reputation began spilling over into lay circles. In 1901 he came to the attention of Frederick T. Gates, the grand master of the Rockefeller philanthropies. Welch was asked to help organize the Rockefeller Institute for Medical Research. He soon became chief adviser to the Rockefeller foundations on medical projects, assisting in important ways in funding medical education in the United States and China, in developing public health programs in the United States and around the world, in organizing and heading this country's first school of public health, and more. In 1930 his eightieth birthday was honored around the world with a live radio broadcast throughout the United States and Europe presided over by President Hoover and simultaneous celebrations in major cities in Europe and Japan.

William H. Welch was indeed a man whose life and career spanned the fortunes of medical science, from its struggling infancy to its prodigious material success. His life combined the perfect mix of ambition, talent, single-minded dedication, and opportunity to make him the ideal of academic medicine in the United States. His gregariousness and wit kept him from being the recluse that his rejection of intimate relationships might have otherwise encouraged. His considerable talent combined with his initially almost frantic ambition to give him a

competitive edge in medicine.

Nevertheless, these qualities would have yielded few rewards had the opportunities not come at the right moments. If Welch had not been born a white male into a prosperous class, he would never have had the material support he needed. If Welch had been born fifty years earlier, there would have been no support for scientific medicine. If he had been born fifty years later, he might well have been just another competent medical researcher. If Johns Hopkins medical school had not been filling its faculty

## 104 I Scientific Medicine II

slots when he was an ascending star in New York medical science, he might have been forced to divert energy into a lucrative private practice and lost his singular immersion in medical academia. If the Rockefeller philanthropies had not sought to develop scientific medical research, to reform medical education, and to develop public health programs, he might not have had a sufficient vehicle for his talents and might not have achieved his reputation as a world statesman and celebrity. While Welch was the right person in the right place at the right time, his spectacular career depended upon more than luck. His sex, race, and social class were crucial conditions for his success. But the development of corporate capitalism was perhaps the most important condition because it provided the ideological and cultural support for scientific medicine and the material support for his research.

It is likely that Welch would have fared well even without the Rockefellers since his reputation would have enabled him to skim off the best positions in medical science. Medical research and education as a whole, however, were helped immensely by the wealth of the Rockefeller fortune. Under the skillful direction of foundation officers, the Rockefeller wealth became the largest single source of capital for the development of medical science in the United States, the conversion of medical education to a scientific research basis, and the development of public health programs in the United States and abroad.

For the first quarter of the twentieth century the Rockefeller officers developed a definite strategy for their capital investment in medicine. That strategy sometimes supported and often opposed different interests in medicine, but such alliances and conflicts were never accidents on the part of the foundation. They were anticipated and necessary consequences of the role of modern medicine in the society, as desired and articulated from the very pinnacles of the American class structure.

Why was so much Rockefeller money—\$65 million by 1928—lavished on a single institution devoted to scientific medical research? What motivated the men at the Rockefeller philanthropy to spend so much of their energy and money on medicine? How important were their humanitarian feelings for their fellow human beings? Did they envision material benefits from their work? As capitalists and corporate managers, did they believe it would further their personal interests or their class interests? The

## Scientific Medicine II I 105

self-consciousness of their pioneering effort made accessible the concerns and thinking behind the facades constructed in foundation-funded histories and authorized biographies.

## ROCKEFELLER MONEY AND MEDICAL SCIENCE: A SOCIAL INVESTMENT

On June 2, 1901, New York's newspapers hailed the founding of the Rockefeller Institute for Medical Research. The most celebrated example of private philanthropy supporting medical research, the institute began a new epoch in the United States. More than its predecessors abroad, the Rockefeller Institute would attack a broad range of diseases, seeking understandings of their biological and chemical causes, developing methods of prevention and cure, and training hundreds of researchers for medical science.

The institute began modestly with a commitment of \$20,000 a year for research grants and soon after an outright gift of \$1 million from John Davison Rockefeller. By 1928 Rockefeller gifts to the institute totaled \$65 million, an enormous sum for the period. Although the elder Rockefeller and his son are most widely known for the benefactions, it was Frederick T. Gates who formulated the strategies and initiated the investments in

medical research, medical education, and public health.

In 1915 Gates set down his memories of the origins of the institute. His anecdotal recollection stands as the widely quoted history of the origins of Rockefeller medical philanthropy.<sup>10</sup> As folklore, it conveys the process and motivations the creator of the Rockefeller Institute wished us to believe about the germination of his interest.

In his retrospective story, Gates describes how the idea for the institute came to him. As minister of the Central Baptist church in Minneapolis from 1880 to 1888, Gates had countless experiences with regular and homeopathic doctors. His visits to "hundreds of sick rooms" and his close relations with several physicians confirmed "a profound scepticism about medicine of both schools as it was currently practiced." As for homeopathic medicine, he concluded that Samuel Hahnemann, the founder, was "Httle less than a lunatic." He had little more confidence in the regular, or orthodox, school.

## 106 I Scientific Medicine II

Then in 1897, six years after joining Rockefeller's staff, he befriended a former member of his Minneapolis congregation who was a medical student in New York. He asked the young man to suggest a readable medical text used in the best medical schools. On his young friend's recommendation, Gates bought himself a copy of William Osier's *Principles and Practice of Medicine*, first published in 1892, and a pocket medical dictionary.

Gates took Osier's book with him to join his family vacationing in the Catskills and read through its approximately 1,000 pages of revelations about the state of medicine. Osier laid bare the limitations of current medical knowledge and practice. Gates learned that many diseases were caused by germs, only a very few of which had been identified and isolated but many of which "we might reasonably hope to discover."

When I laid down this book, I had begun to realize how woefully neglected in all civilized countries and perhaps most of all in this country, had been the scientific study of medicine. I saw very clearly also why this was true. In the first place, the instruments for investigation, the microscope, the science of chemistry, had not until recently been developed. Pasteur's germ theory of disease was ver> recent. Moreover, while other departments of science, astronomy, chemistr>% physics, etc., had been endowed very generously in colleges and universities throughout the whole civilized world, medicine, owing to the peculiar commercial organization of medical colleges, had rarely if ever, been anwhere endowed, and research and instruction alike had been left to shift for itself dependent altogether on such chance as the active practitioner might steal from his practice. It became clear to me that medicine could hardly hope to become a science until medicine should be endowed and qualified men could give themselves to uninterrupted study and investigation, on ample salary, entirely independent of practice. To this end, it seemed to me an Institute of medical research ought to be established in the United States.

In July, Gates returned to his office in the Standard Oil building with "my Osier" in hand and dictated a memorandum to Rockefeller. He laid out his conclusions about the tragic state of medicine in the United States and its immense potential. He pointed out the usefulness of the Koch Institute in Berlin and the Pasteur Institute in Paris. In support of his recommendation for

## Scientific Medicine II I 107

an American institute, Gates explained to Rockefeller that Pasteur's discoveries about anthrax and diseases of fermentation "had saved for the French nation a sum in excess of the entire cost of the Franco-German War." He also insisted that an institute founded by Rockefeller would encourage other wealthy men and women to found and endow other research centers, with the total effort yielding "abundant rewards."

While the memo to Rockefeller did not result in immediate action, it did provide the coherent rationale six months later for opposing the affihation of Rush medical college with the University of Chicago, at the time Rockefeller's dearest and largest philanthropy. Rush was a respected school of the regular profession, a follower of the scientific vanguard but not among them. Gates got Rockefeller's support for a letter urging the university's administrators to abandon Rush and offering them instead a new medical center, "magnificently

endowed, devoted primarily to investigation, making practice itself an incident of investigation." For some reason, probably related to the influence in Chicago of Rush's wealthy and socially and politically prominent practitioner-faculty members, the marriage was consummated anyway. Chicago lost its chance for the proposed institute. Thus was Gates' idea for the institute born and preserved from the clutches of medical sectarianism.

Gates' proposal was carefully considered through 1899 and 1900. Gates and Rockefeller, Jr., who joined the philanthropy staff in 1897, hired Starr J. Murphy, a lawyer friend and Montclair, N.J., neighbor of Gates, to study European institutes and confer with leading medical researchers in this country. L. Emmett Holt, pediatrician to several of Senior's grandchildren and a fellow parishioner at Junior's Fifth Avenue Baptist church in New York, impressed upon Junior the broad and basic biological research that led to the recent discovery of diphtheria antitoxin. What was needed to solve other great problems in medicine, he told the younger Rockefeller, "were men and resources which could be devoted solely to the work of research."^^

Finally, in December 1900 John Rockefeller McCormick, the elder Rockefeller's three-year-old grandson, fell ill with scarlet fever. On the second day of the New Year he died. Any hesitancy the old man, a follower of homeopathy, felt about endowing

## 108 I Scientific Medicine II

scientific medical research was undermined when he was told by respected New York doctors that they knew little about the cause of scarlet fever and had no cure for it.^^

Gates and the Rockefellers were also concerned about competition for their proposed institute. Andrew Carnegie's rival research institute, endowed with \$10 million as the Carnegie Institution of Washington in 1902, was then in the planning stages. Rockefeller, Jr., was sufficiently concerned about the competition to wring an agreement from the steel king that his institution would not enter the field of medical research. At the same time Henry Phipps was founding an institute for the study of tuberculosis in Philadelphia. Competition struck close to home when Rockefeller's daughter Edith and son-in-law Harold F. McCormick unveiled their plans for a tribute to their son, the John Rockefeller McCormick Memorial Institute for Infectious Diseases in Chicago.^^

By March 1901 Rockefeller committed himself to funding Gates' proposed institute. The Rockefeller Institute for Medical Research began its work with \$20,000 a year for grants to medical researchers and soon thereafter a \$1 million gift from Rockefeller, a board of directors composed of physicians—including Holt and Welch—with training in pathology and a commitment to bacteriological research, and Dr. Simon Flexner as the executive director.

For more than two years Gates grew increasingly impatient as the "medical gentlemen" restricted themselves to supporting small research projects around the country.^^ Finally, in the fall of 1904, the board opened its first laboratories and began its own program of medical research. In November 1907 Rockefeller gave the institute an additional endowment but held back half the \$6 million requested by the directors. Finally, in October 1910, after the institute was reorganized—reducing the board of directors to a lesser role as the Board of Scientific Directors and creating a new board of trustees with Gates as chairman—Rockefeller added to the institute's endowment, providing it with the yearly income from \$6.4 million of investments. By 1920 the Rockefellers had given the institute \$23 million and by 1928 some \$65 million.^'

The institute was organized independently of any university primarily for reasons of efficiency and to avoid conflict with

## Scientific Medicine II I 109

Senior's commitment to homeopathy. First, Gates and Rockefeller, Jr., wanted the institute free of any teaching pressures. The objective of the institute was to produce results in medicine in order to reduce the amount of disease in society, and it would be a diversion of resources to ask the researchers to teach.'^

Second, the handful of scientific medical schools, while nominally above medical sectarianism, were the turf of the regular profession's elite. The elder Rockefeller, a lifelong follower of homeopathy, objected to any move

that strengthened the regular profession in its conflict with homeopaths. It was undoubtedly on this basis that Rockefeller in 1898 supported Gates' objection to the alliance between the University of Chicago and Rush Medical College, a creature of the regular profession and an opponent of homeopathy. Columbia and Harvard were briefly considered as recipients of the institute, but they were elite regular medical schools. Although neither Gates nor Junior took the old man's concerns seriously, they had to avoid provoking his objections that they were merely supporting one side, the wrong side in the conflict. With the example of the independent Pasteur Institute before them, the efficiency of a purely research institute as their primary concern, and their desire to assuage Senior's hostility to regular schools. Gates and Rockefeller, Jr., agreed to exclude any university affiliation for their project. ^^

## HOMEOPATHY: THE CONFLICT SIMMERS

The conflict over homeopathy continued for some years. It is an illuminating example of the workings of the Rockefeller philanthropies, and it suggests an ideological difference between the robber barons like Senior who built up huge industrial empires and the next generation of corporate capitalists who ran the operations.

Rockefeller continued to express his concerns that within the institute and later in his philanthropies' support for medical education, his money was being used to support the regular profession at the expense of the homeopaths. "I am a homeopath-ist," he scolded his staff in 1916. "I desire that homeopaths should have fair, courteous, and liberal treatment extended to them from all medical institutions to which we contribute."^\* In

## no I Scientific Medicine II

1919, when he was considering a \$45 million gift to his General Education Board to support medical education, Rockefeller again warned his son and staff: "Homeopathic teaching should not be excluded ... it should be provided for, the same as Allopathic."•^\*

His son and his staff firmly and repeatedly explained that "scientific medicine has rendered obsolete the former distinctions between the so-called Homeopathic and the so-called regular or Allopathic schools."^^ The new medicine is free of dogma, free of values. It represents not "preconceived notions" about the world but only "ascertained facts."^^ Medical science is devoid of "medical dogma of any kind."^^

Furthermore, as the homeopaths and regular schools "are constantly drawing nearer together," a trusted adviser wrote the old man, "the discriminations which formerly were practised against homeopaths are being constantly lessened." Simon Flexner provided assurances that at the Rockefeller Institute "they make no distinction and welcome to their staff qualified men irrespective of the school in which they have been trained."^^

That John D. Rockefeller personally patronized a homeopath-ist might seem surprising. However, Rockefeller and homeopathy were both products of the nineteenth century. From the mid-nineteenth century on, homeopathy in the United States appealed primarily to the upper classes. It was safer than the heroics of regular medicine, and it was a sign of affluence and taste since it was very fashionable among the European nobility and upper class, who were aped in many ways by wealthy Americans.^^ Rockefeller, who was twenty-two at the outbreak of the Civil War, grew up believing that homeopathy was medically and socially desirable.

Furthermore, while Rockefeller used chemists and engineers in developing his Standard Oil empire, his chief assets were an unbridled ambition and an intuitive and cunning sense of opportunity and organization. He accumulated the largest fortune among all the robber barons by paying his workers as little as possible and by ruthless methods in the marketplace, extracting huge rebates from the railroads for his shipments and cutting the

\*"Allopathic" was another term for the regular, or orthodox, sect of the medical profession.

price of refined oil products to drive his competitors out of business. He did not fully share his son's and his later managers' appreciation of the importance of science in developing the base of industrial capitalism.

In his retirement and devotion to giving away his fortune, Rockefeller generally gave free reign to Gates and his son. He knew that his caution in disposing of his fortune was shared by his trusted lieutenants. Within his philanthropies he had the money but did not take the authority to establish policy. It seemed sufficient to him that his name was no longer the object of spittle, but rather gratitude. Except for occasional questions, taciturn consideration of his advisers' requests for millions of dollars, and objections to the treatment of homeopaths, Rockefeller, Sr., left the running of his philanthropies and his financial empire alike to Gates and his son.

Although Gates and Junior worked together in developing programs and prying gifts from the occasionally reluctant father. Junior himself acknowledged that "Gates was the brilliant dreamer and creator," and "I was the salesman, the go-between with father at the opportune moment."^^ Fortunately for history. Gates was a prolific writer of his ideas, leaving his thoughts in letters to Rockefeller, Sr., speeches to the various philanthropic boards, and memos to himself and his staff. Given his central role in the Rockefeller philanthropies and the importance of these philanthropies in the development of scientific medicine, it is illuminating to consider Gates' views of the role and consequences of medical science.

## SCIENTIFIC MEDICINE AND CAPITALIST GATES

Gates, the premier Rockefeller medicine man, was attracted to medical science. It was not the appeals from medical science that drew his interest or his money. He was, like most educated people of the late nineteenth century, vaguely aware of the march of progress in medicine. He knew of Pasteur and the germ theory of disease. He had read Osier and understood the potential of medical science. But he never heard of Dr. Simon Flexner or Dr. William H. Welch, and he had no contact with other medical scientists until he initiated the medical institute. Nevertheless, he did "intelligently and clearly see that there was a tremendous

### 112 I Scientific Medicine 11

need of medical research." Whatever requests for money for medical science crossed Gates' desk, none was taken seriously until 1907, when McGill University asked for aid to replace two medical school buildings that had been destroyed by fire.^ ^

Gates was always an autonomous figure in medical philanthropy. He was moved by his own conceptions of the value of medicine and his own strategies for developing its role in American society. He was certainly influenced by medical men whom he respected, above all Simon Flexner and William Welch, but it was because their ideas and contributions conformed to his plans for the transformation of medicine. What visions did he have of the role and functions of scientific medicine?

We may grant that Gates had genuinely humanitarian motivations. His ministrations to the sick and dying in his Minneapolis parish undoubtedly evoked sympathy for their suffering. In his later years he credited medical science with standing above all other elements of history. None but medicine has "done so much to promote all the forces of civilization, to increase human happiness or to ameliorate human suffering."^ ^

Typical of Gates, his enumeration of the accomplishments of medical science places the relief of human misery after the promotion of the "forces of civilization." This is not a petty criticism, for Gates' preeminent consideration was the development and extension of Anglo-American civilization. What he understood that civilization to represent will become clear in the following pages, but in its essence "civilization" meant the values of work and disciplined living, a social life organized around productive labor and frugal consumption. "Civilization" also meant the right and indeed the responsibility of men of wealth to govern society and of industrial societies to direct economically less developed societies. In brief, "civilization" was equated in Gates' mind with industrial capitalism and imperialism.

What value did scientific medicine have for capitalism? Gates envisioned numerous material and social-political consequences flowing from medical science in a never-ending stream of support for capitalist society.

## HEALTHIER WORKERS

The material benefit of medicine is a healthier population and thus a healthier work force. What Pasteur's work

on anthrax had

done for the French cattle industry, medical science could do for the whole society. The findings of medical science were most important when applied to preventing disease. "By keeping well," Gates observed, a person "enjoys all the employments, pleasures, and financial gains of continuous health." Gates insisted from the beginning of his career to its end that "the fundamental aim of medical science ought to be not primarily the cure but primarily the prevention of disease."<sup>^\*</sup>

Gates believed that events supported his contention. In the first quarter of the twentieth century, "sanitary science and preventive medicine" had reduced sickness by half, he asserted, citing support from U.S. Census Bureau reports of mortality rates, insurance company statistics, and reports of state and local health boards.<sup>^ ^</sup> Although sickness was still a major obstacle to the full utilization of labor, the assault by the forces of science was paying off. Gates cited a report that 20 percent of the employees of large companies were home sick each day, but, he added, triumphantly, "I think that even so high a figure is far below that of the armies of [General] Washington."<sup>^°</sup>

Gates was far from a solitary figure preaching the potential of medicine for capitalists. Big business. Gates observed in 1925, sponsored preventive medical care programs on a large scale "because health is found in a variety of ways to be profitable."<sup>^</sup> Healthy workers are profitable because they are an employer's "human capital" to be utilized for production of salable goods and services. Just as the capital invested in machines needs to be protected by adequate maintenance programs, so too does human capital require maintenance and repair, a perspective long recognized in many contexts.

Southern slave owners and their physicians viewed their black slaves as a capital investment to be saved from disability or death whenever possible, lending credibility to the myth of paternalistic slavery. In a study of the role of medicine in the ante-bellum South, Walter Fisher concluded that the primary reason why slaves were provided with medical care was the tremendous economic investment they represented to slave owners.<sup>^ ^</sup> Every planter understood that "to save his capital was to save his negroes," observed Dr. Richard Arnold, an upper-class physician in Savannah. The self-interest of the slave-owning class in the preservation of its investment made Southern slavery "the only

## 114 I Scientific Medicine II

institution in which Interests and Humanity go hand in hand together," Dr. Arnold wryly added."

It was not only racism and slavery that facilitated "paternalistic" self-interest. The U.S. Sanitary Commission, organized in 1861 to provide medical relief to Union soldiers on Southern battlefields, was by its own account no humanitarian enterprise. Run by wealthy Easterners, the commission declared "its ultimate end is neither humanity nor charity. It is to economize for the National service the life and strength of the National soldier." Saving a soldier's life, the commission calculated, reduced the monetary cost of the war and preserved the soldier as a "producer" when he "returned to the industrial pursuits of civil life." Each soldier's life was worth "no less than one thousand dollars" to society.<sup>^" ^</sup>

With the rapid development of an industrial base in the United States during and after the Civil War, employers in many industries viewed their workers as disposable resources. Particularly with increasing mechanization in industrial production, a decreased demand for skilled workers, and an unlimited supply of desperate immigrants, the work force became a sea of men and women to be plucked up by employers as needed and later tossed out. Workers who were maimed, killed, or simply worn out by their jobs were replaced by other bodies from among the unemployed.

As the unemployed work force shrank with the outbreak of war or upswings in the economy, as labor organized to change its working conditions and pay, and as employers found that lost production because of illness and rapid turnover of their workers cost them profits, enlightened businessmen developed new attitudes toward their workers. It was not concern for the workers' needs that led to better conditions and health and welfare programs. Rather these reforms sprang from the industrial unionism and political organization of workers and

from the opposing necessity of employers to discipline the work force to the requirements of capitalist production. The firm that improved its working conditions reduced work days lost to strikes. The firm that took pains to keep its workers found increased productivity from its capital investment. The firm that offered company housing, shares of stock, and company medical care increased the dependence of the workers on the company and lessened the

## Scientific Medicine II I 115

threat of unionization. And, in the early years of this century up to World War I, industries that voluntarily acted could reduce the risk of restrictive legislation demanded by the forces of Progressivism. As early as 1892, following the bloody Homestead strike, Andrew Carnegie articulated a more conciliatory policy toward his workers to prevent the loss of experienced workers, though there is little evidence that he or his company followed the policy. "It is impossible," he said, "to get new men to run successfully the complicated machinery of a modern steel plant." Labor stability became an important element in the productivity and profit strategies of modern industries. "It is good business to conserve life and health," observed John Topping of Republic Steel, for thereby "one of the most important items of economy in production is secured."

Industrialists who weathered the marketplace and emerged among the monopolistic leaders of their industry had the capital and foresight to ward off unionization and stabilize their work forces with health and welfare programs. Steel companies, railroads, oil companies, and others created complete medical care systems for their workers, hiring or contracting with physicians and providing dispensaries or hospitals.

The efforts of slave owners and the U.S. Sanitary Commission to preserve lives by curing disease were aimed at conserving human capital, the one "belonging" to an individual and the other profiting a whole class. The medical programs of individual corporations were aimed more at undermining unionization and stabilizing their own work forces, with improved health an added benefit rather than the main purpose. Thus, slave owners and industrial corporations exhibited enlightened self-interest while the upper-class sanitary commissioners demonstrated a more far-sighted plan for investing in the whole society's work force. The latter is an articulated interest of an entire class—the interest of the capitalist class in a stable and healthy work force.

Frederick T. Gates consistently articulated this larger perspective and shaped his philanthropic programs around it. He understood the importance of a healthy work force to the growth of capital and industrial output. The Rockefeller Sanitary Commission, organized by Gates in 1909, sought to eradicate hookworm disease from the southern U.S. population. Charles Warden Stiles, a government zoologist, convinced Gates and

## 116 I Scientific Medicine II

Junior that the hookworm was "one of the most important diseases of the South" and a cause of "some of the proverbial laziness of the poorer classes of the white population." Whatever genuine pride the Rockefellers and Gates felt in relieving the suffering of thousands of Southerners, their primary incentive was clearly the increased productivity of workers freed of the endemic parasite. Gates observed that the stocks of cotton mills located in the heavily infected tidewater counties of North Carolina were worth less than mills in other counties of the state where fewer people were infected. "This is due," he explained to Rockefeller, Sr., "to the inefficiency of labor in these cotton mills, and the inefficiency in the labor is due to the infection by the hookworm which weakens the operatives." Gates calculated, "It takes, by actual count, about 25 percent more laborers to secure the same results in the counties where the infection is heavier." It also took 25 percent more houses for the workers, more machinery, and thus more capital and higher operating costs. "This is why the stocks of such mills are lower and the profits lighter."

The Rockefellers did not have any significant investment in Southern textile mills. Rather their extensive and widespread investments gave them a concern for the productivity of the entire economy. The Sanitary Commission was a logical extension of their educational programs in the South (discussed in Chapter 1), all directed ultimately to integrating the Southern economy into the national dominion of Northern capitalists.

Through the International Health Commission—the first program of the Rockefeller Foundation established in

1913—the hookworm and other public health programs were extended worldwide. None of these programs was intended to prop up specific Rockefeller investments abroad. They were directed more generally at improving the health of each country's work force to facilitate sufficient economic development to provide the United States with needed raw materials and an adequate market for this country's manufactured goods. Stacy May, an economist and a director of a Rockefeller-controlled international investment corporation, recently reaffirmed the value of such programs. "Where mass diseases are brought under control, productivity tends to increase—through increasing the percentage of adult workers as a proportion of the total population, [and]

through augmenting their strength and ambition to work," he observed.<sup>^\*</sup>

Each of these programs can be traced to Gates' and the Rockefellers' broader concern for the permanent economic and social viability of capitalist society. Gates viewed the public health in a larger capitalist class perspective than probably any other important figure in the various medical reform movements of the period. Although his articulated views on the relation between health and capitalism were more complete than other capitalists of his era, he was not alone in maintaining the importance of such programs.

The American Association for Labor Legislation, a Progressive era alliance of corporate-liberal business leaders, some labor leaders, and upper middle-class reformers, won business support for its proposal for compulsory national health insurance mainly on the basis of the self-interest of employers. "Illness as well as injury occasion a large economic waste to the company as well as to the employees on account of lost time, idle machinery, and ineffective work," reported Howell Cheney of the Cheney Brothers' Silk Mills. "It is to the direct interest of the company as well as to the individual to bring about a reestablishment of health, and consequently efficiency, by supplying the best conditions possible for recovery."<sup>^^</sup>

The National Association of Manufacturers committee on industrial betterment supported compulsory sickness insurance against voluntary systems largely because of the importance they attached to a healthy work force. "We know that there are employers who would not comply with the voluntary plan," the NAM committee warned. Even a corporation president who sees the long-run advantages of "enhghtened" industrial relations may bow blindly to maximizing this year's profits. This was an important enough issue, they argued, that the State must "subordinate the independence of the individual to the general good."<sup>\*\*\*^</sup>

It was not primarily a concern for conserving human life that led America's corporate liberals in the Progressive era to support compulsory health insurance. From Bismarck to the Conservative party in England to the American Association for Labor Legislation and the National Civic Federation, the far-sighted leaders of corporate capitalism believed that government-sponsored sick-

## 118 I Scientific Medicine II

ness insurance, workers' compensation, and other social security measures would reduce the appeal of radical labor and socialist movements/<sup>^</sup> Hoping to depoliticize workers' unhappiness with their lot, corporate leaders joined reformers in calling for such moderate reforms. Despite this expedient application of medical care programs, leaders of many corporations as well as the conservative National Association of Manufacturers believed that medical care, when extended to the whole population, would substantially improve the health of workers and their families, which included future workers.

Sharing the concern of the business class, the vanguard of scientific medicine considered the economic benefits of medicine among its most important effects. The smaller view pervaded the thinking of physicians working in a particular company's health programs. C. W. Hopkins, chief surgeon for the Chicago and Northwestern Railway, told the 1915 annual meeting of the American Academy of Medicine that the railroads found it economically desirable to organize medical care programs because it cost them \$500 to train an employee and because experienced and healthy workers were important in reducing accidents that injure passengers and destroy property. "It is now a well-recognized fact among the managements of the railroads," reported Dr. Hopkins, "that it is just as important to care for their sick and injured [workers] as it is to maintain a certain standard of efficiency or perfection of their rolling stock and road bed."<sup>^^</sup>

Broader views of medicine's material importance to society guided strategies of men who led the medical reform movement at elite universities and the national level. Charles W. Eliot, the Harvard president who launched major medical reforms beginning in 1869, considered medical research both pure and applied. At the dedication ceremonies for the Rockefeller Institute's laboratories in 1906, Eliot characterized research medicine's primary object as striving for "truth in the abstract" and its secondary objects as preventing "industrial losses due to sickness and untimely death among men and domestic animals," and lessening the negative impact of sickness on human happiness."^^

William H. Welch, at the same ceremony, asserted with pride that scientific medicine made possible the "great industrial

## Scientific Medicine II I 119

activities of modern times, efforts to colonize and to reclaim for civilization vast tropical regions, [and] the immense undertaking to construct the Panama Canal/"" For the most part, academic doctors were content to support the uses of medical science laid down by the philanthropic strategists whose funding programs guided the development and utilization of research. The medical profession thus accepted the capitalist definition of health as the capacity to work.

## IDEOLOGICAL MEDICINE

### AN INDUSTRIALIST WORLD VIEW

For philanthropist and capitalist Gates, the material consequences of medical science were only one of its advantages. Indeed, Gates gave more attention to the other advantages that intrigued him. Probably more than any of his contemporaries, Gates perceived and understood the ideological functions of medicine. Some of his thoughts were implicit understandings of the relation between scientific medicine and industrial capitalist ideology. His most systematic thinking concerned the social value of medical science as ideology and as a cultural force.

Members of any society or social class whose existence is intimately tied to industrialism will find scientific medicine's explanations of health and disease more appealing than mystical belief systems. The precise analysis of the human body into its component parts is analogous to the industrial organization of production. From the perspective of an industrialist, scientific medicine seems to offer the limitless potential for effectiveness that science and technology provide in manufacturing and social organization. Just as industry depends upon science for technically powerful industrial tools, science-based medicine and its mechanistic concepts of the body and disease should yield powerful tools with which to identify, eliminate, and prevent agents of disease and to correct malfunctions of the body.

Gates and other industrial capitalists found a close correspondence between this new medicine's concepts of the body and disease and their own world view. The body, Gates believed, is a microcosm of society, and disease is an invasion of external

## 120 I Scientific Medicine II

elements. Medical research must discover the agents of disease and find the means of preventing their destruction of the body or provide a cure. Health, in Gates' view, is the absence of disease. "Nearly all disease," Gates explained to Rockefeller,"^^

is caused by living germs, animal and vegetable, which finding lodgement in the human body, under favorable conditions multiply with enormous rapidity until they interfere with the functions of the organs which they attack and either they or their products poison the fountains of life.

Nature's healing methods are strikingly similar to the organization of industrial society.

When, for illustration, the skin is cut with a knife, nature at once begins to hurry to the point of disaster

squadrons of white corpuscles of the blood and other healing forces. Just as the fire engines start from all quarters on the dead run to a fire when the alarm is sounded, healing forces rush from every part of the body to the point of trouble, some to destroy any poisonous germs that may get into the wound, others to unite the wounded parts as before.

The body in which nature works is constructed like a Lilliputian community, complete with modern social organization and industrial plants.

The body has a network of insulated nerves, like telephone wires, which transmit instantaneous alarms at every point of danger. The body is furnished with a most elaborate police system, with hundreds of police stations to which the criminal elements are carried by the police and jailed. . . . The body has a most complete and elaborate sewer system.

The body's industrial life exists in

an infinite number of microscopic cells. Each one of these cells is a small chemical laboratory, into which its own appropriate raw material is constantly being introduced, the processes of chemical separation and combination are constantly taking place automatically, and its own appropriate finished product is constantly being thrown off, that finished product being necessary for the life and health of the body. Not only is this so, but the great organs of the body like the liver, stomach, pancreas, kidneys, gall bladder, are great local manufacturing centers, formed of groups of cells in infinite number, manufacturing the same sorts of products, just as industries of the same kind are often grouped in specific districts.

Scientific Medicine II I 121

"We are fearfully and wonderfully made," Gates ironically concludes, as though praising some new machine created in God's own image. Because "nature is the great physician," her healing powers have obscured the failing of all pre- and nonscientific forms of medicine. Recovery from disease before the advent of scientific medicine, Gates believed, was due entirely to the power of nature as healer. Homeopathic and orthodox medical sects, Christian Science, psychic healers, osteopaths, Indian herb doctors, and patent medicine men all survived by claiming nature's cures as their own.

Only science was able to comprehend nature. "Science has discovered the laboratories where she has stored her reserves and has robbed her of them for use on human beings." Medical researchers in Gates' day were pressing the campaign against disease on two fronts: "they are trying to break into and expose to the light many more of the secret processes in nature's laboratories," and "they are working to create new chemical combinations that will cure."

Gates thus appreciated the human body as one of nature's puzzles, to be investigated and understood by science. His view, shared by scientific doctors, engineers, professionals of all sorts, and most corporate executives and owners, envisioned health as the absence of disease and medicine as an engineering task. Science was helping industry reshape the organization of production by developing machinery to control and cheapen human labor and more cheaply extract from nature a salable product. Science would also extract from nature the secrets of life itself while medicine would apply them to understand disease and develop methods of preventing or curing these pestilences of life and commerce. Improving the health of the population was thus an engineering job that involved understanding and manipulating nature.

Gates' views were not very different from those generally held by medical scientists of his day. While few directly applied the analogy of industrial society, nearly all conceived the body in mechanistic terms that made such an analogy seem natural. The similarity between the constructs of scientific medicine and the world view of industrial capitalism made it seem natural for the new order to support scientific doctors against all "quacks." The medical profession benefited from the compatibility of its theo-

## 122 I Scientific Medicine II

ries with the perspectives of the newly dominant class, but the capitalist social order won extraordinary ideological and cultural advantages.

## INDUSTRIAL CULTURE AND CAPITALIST LEGITIMATION

Scientific medicine's singular concern with the microbiological interaction of the human body and specific disease states had political consequences which Gates and a few others envisioned. In brief, Gates embraced scientific medicine as a force that would: (1) help unify and integrate the emerging industrial society with technical values and culture, and (2) legitimize capitalism by diverting attention from structural and other environmental causes of disease.

Gates and other officers in the Rockefeller foundations believed that medicine had an important cultural role to play. Gates believed that the goal of medicine, the "healing ministration," is "the most intimate, the most precious, the superlative interest of every man that lives." After food, water, sleep, and sex, freedom from disease is the great longing of all peoples. The desire for health is a unifying force "whose values go to the palace of the rich and the hovel of the poor." Medicine is "a work which penetrates everywhere." Thus, "the values of medical research are the most universal values on earth, and they are the most intimate and important values to every human being that lives."""^

With medicine's unique acceptance by all people, the Rockefeller Foundation discovered what the missionaries also knew: Medicine can be used to convert and colonize the heathen. In 1909 the Rockefeller philanthropies added public health programs to their earlier efforts to develop public schools and promote agricultural demonstration projects in the South in part because medical care is so seductive to even the most reluctant people.

In China, Gates switched from supporting religious missionaries to building a Western medical system. This episode is fascinating both because of the greater value that Gates, a man of the cloth, placed on scientific medicine in promoting Western influence and because of the unabashed imperialist motivations he himself attributed to Rockefeller philanthropies abroad. In 1905 Gates urged Rockefeller, a frequent contributor to Baptist

## Scientific Medicine II I 123

missionaries, to donate \$100,000 to an organization of Congregational missions/" "Now for the first time in the history of the world," Gates explained to Rockefeller,

all the nations and all the islands of the sea are actually open and offer a free field for the light and philanthropy of the English speaking people. . . . Christian agencies as a whole have very thoroughly invaded all coasts, all strategic points, all ports of entry and are thoroughly entrenched where they are.

For Gates, transforming heathens into God-fearing Christians was "no sort of measure" of the value of missionaries:

Quite apart from the question of persons converted, the mere commercial results of missionary effort to our own land is worth, I had almost said a thousandfold every year of what is spent on missions. . . . Missionary enterprise, viewed solely from a commercial standpoint, is immensely profitable. From the point of view of means of subsistence for Americans, our import trade, traceable mainly to the channels of intercourse opened up by missionaries, is enormous. Imports from heathen lands furnish us cheaply with many of the luxuries of

life and not a few of the comforts, and with many things, indeed, which we now regard as necessities.

Industrial capitalism, however, required not only raw materials and cheap products. It also needed new markets for its abundant manufactured goods. As Gates added to Rockefeller's receptive ear:

our imports are balanced by our exports to these same countries of American manufactures. Our export trade is growing by leaps and bounds. Such growth would have been utterly impossible but for the commercial conquest of foreign lands under the lead of missionary endeavor. What a boon to home industry and manufacture!

The missionary effort in China was effective for a time in undermining Chinese self-determination. Missionaries were the velvet glove of imperialism, frequently backed up by the mailed fist. Nevertheless, the missionary effort, promoted through schools and medical programs, was still a very transparent attempt to support European and American interests. As J. A. Hobson, an English economist, noted at the time, "Imperialism in the Far East is stripped nearly bare of all motives and methods save those of distinctively commercial origin.

"48

## 124 I Scientific Medicine II

In China, as throughout the world, the Rockefeller philanthropists soon concluded that medicine and public health by themselves were far more effective than either missionaries or armies in pursuing the same ends. The Rockefeller Foundation removed the Peking Union Medical College from missionary society control, established it under foundation direction, and developed it into a completely secular, world renowned medical center, spending a total of \$45 million for the China medical program.

In the Philippines, the foundation's International Health Commission outfitted a hospital ship to bring medical care and the "benefits of civilization" to the rebellious Moro tribes. The foundation officers were ecstatic that such medical work made it "possible for the doctor and nurse to go in safety to many places which it has been extremely dangerous for the soldier to approach." Their medical work paved "the way for establishing industrial and regular schools" and served as "an entering wedge for permanent civilizing influences."^^ Thus, in subduing primitive peoples and bringing them into desired colonial relations, medical care has, in the words of foundation president George Vincent, "some advantages over machine guns."^o

Given the openly imperialist ambitions of the United States early in this century, the Rockefeller philanthropy officers could publicly acknowledge their use of medicine to integrate dissenting people into industrial and capitalist society. Their domestic medical programs had exactly the same ends, though Gates and others were far more circumspect in discussing them.

Medicine was increasingly replacing religion as the intimate arm of the social order. In education the teaching of values was obvious, and attempts to reform the schools provoked angry responses from a class-conscious society.^' In 1914 the National Education Association's attacks on the Carnegie and Rockefeller foundations were joined by many newspapers that condemned the foundations for trying to turn "our schools into mills for the manufacture of men and women made according to Rockefeller and Carnegie specifications." Medicine was more insidious.

For Gates to see medicine as a desirable replacement for religion was indeed an interesting turn of events. Gates, it will be recalled, was successively a Baptist minister, executive secretary of the American Baptist Education Society, and Rockefeller's

## Scientific Medicine II I 125

chief lieutenant in charge of the industrialist's philanthropy and a large part of his financial empire. Like other members of the managerial stratum, Gates identified his own interests and destiny with those of his employer.

Shortly after his move from the ministry to directing the largest philanthropic and financial empire in the world,

Gates' views on religion began to change. He began to read the Bible more critically and was soon convinced that "Christ had neither founded nor intended to found the Baptist church, nor any church; that neither he nor his disciples during his lifetime had baptized; that the communion was not conceived by Christ as a church ordinance, and that the whole Baptist fabric was built upon texts which had no authority, and on ecclesiastical conceptions wholly foreign to the mind of Christ."^^ Gates found himself converted from Baptism to capitalism and scientism!

Medicine was a fundamental part of his new "religion." While theology was being "reconstructed in the light of science," scientific medicine was promulgating "new moral laws and new social laws, new definitions of what is right and wrong in our relations with each other." For Gates, the Rockefeller Institute for Medical Research was a "theological seminary, presided over by the Rev. Simon Flexner, D.D."^^

Gates did not fully explain the meaning of his metaphor, but it seems clear that he viewed medicine as industrial society's counterpart to religion, carrying moral precepts, "new duties," and the values of science to all people through its universal appeal and irresistible intimacy. This function was understood by leading members of the medical profession as well. Dr. John B. Roberts, in his presidential address to the American Academy of Medicine in 1904, laid out "The Doctor's Duty to the State." The physician "should teach the laity that mental hygiene, or disciplin<sup>e</sup>, is as essential to proper living and happiness as physical hygiene," Roberts said. "Hygiene of the body gives a spirit of religious toleration and calm" whilst "hygiene of the mind gives a healthy digestion and a good income-making body and fits man for this world as well as the next."^^ Scientific medicine was thus an ideal instrument to help unify and integrate the new industrial society and indeed a world order in the values and culture of science, technology, and capitalism.

Western scientific medicine was an uncommonly good vehicle

## 126 I Scientific Medicine II

for United States efforts to dominate Latin America, Asia, and Africa. But it was equally useful in bringing rural and technologically and industrially naive North Americans to accept the domination of their lives by science and technology. Science had provided a basis for rationalizing industry, for organizing production consistent with the imperatives of profit and the growth of capital, and simultaneously for undermining the arguments of workers that the new technology eliminated their control over the productive process. The application of science to industry in fact depoliticized the whole productive process and created the appearance that progress is technology's own imperative. Beneath that rule by technology lay the more fundamental imperative—capitalism's need for economic growth. The march of scientific and technological progress appears as an independent variable on which essential economic growth depends. Science and technology are developed mainly in ways useful to capitalist society, and as Jiirgen Habermas has shown, "the development of the social system seems to be determined by the logic of scientific-technical progress."^^

The same mystification that the technological "imperative" pulls over the productive process is extended to all social spheres. Mechanical engineers, led by Frederick Taylor, developed more "efficient" ways of utilizing human labor in the factory, mainly by separating mental from manual labor, reorganizing the labor process under management's control, and substituting unskilled for skilled labor wherever possible. Although it did not particularly increase profits, Taylor's "scientific management" proved a very effective form of social control.^" It provided a moral rationale for demanding obedience to capitalist values of hard work and disciplined living. "Too great liberty," Taylor wrote to Harvard president Charles EHot, "results in a large number of people going wrong who would be right if they had been forced into good habits."^^ Housewives and mothers were similarly exhorted to be more efficient, for the home was "part of the great factory for production of citizens."^^ Industrial and social leaders of the Progressive era, whether themselves Progressives or not, hoped to rationalize all social relations. The cult of efficiency firmly established in American culture and intellectual life the notion that technology must be served. Added to the

## Scientific Medicine II I 127

already widespread view that science and technology are value-free, the technological imperative became a

powerful moral force.

Corporation heads, presidents of elite universities, and philanthropists all joined in support of the new religion of science. "Respect for the man who knows and loyalty to demonstrated truth," preached Nicholas Murray Butler, president of Columbia University, "are characteristics of a civilization that is founded on rock."<sup>^</sup>«

Research institutes were the temples of the new religion. The Rockefeller Institute for Medical Research will be important in three ways, Butler told the dignitaries assembled for the opening of the institute's laboratories. It will add to mankind's knowledge of medicine, it will help train needed scientists, and it "will help spread abroad in the public mind a respect for science and for scientific method." Each of these contributions is a public service, he added, "but the last named is perhaps the greatest."<sup>^</sup>

Scientific medicine, as part of the fervent campaign for science, helped spread industrial culture, albeit a capitalist industrial culture, throughout the land and indeed the world. But scientific medicine also developed into an ideological perspective that legitimizes the great inequalities of capitalist societies and the misery that results from the private appropriation of human and environmental resources.

At one time, many physicians were in the vanguard of progressive social reform movements. By the mid-1800s social medicine was a highly developed field. Villermé, Buchez and Guérin in France, Neumann, Virchow, and Leubuscher in Germany, and dozens of lesser-known doctors studied the economic, social and occupational causes of disease and worked for reforms to eliminate them. Rudolf Virchow, one of the fathers of modern cell physiology, argued that medicine "must intervene in political and social life. It must point out the hindrances that impede the normal functioning of vital processes, and effect their removal."<sup>""</sup> Many physicians and sanitarians identified and statistically documented inhuman and dangerous working conditions, unemployment, miserable living conditions, malnutrition, and general poverty as the major causes of the high disease rates and early deaths among Europe's working classes.

## 128 I Scientific Medicine II

The failure of the revolutionary movement of 1848, in which many of these physicians participated, did not halt their efforts to change the conditions they opposed.

From the time of Pasteur and Koch, however, a more conservative outlook dominated medical research. The clinical, or medical, model focused attention on the individual, while bacteriological research identified discrete, external, and specific agents of disease. This perspective encouraged the idea of specific therapies to cure specific pathological conditions, and it diverted attention from the social and economic causes of disease. When Koch presented his discovery of the tubercle bacillus to the Berlin Physiological Society in 1882, many medical scientists did not share Koch's view that this bacillus causes tuberculosis. Virchow and others argued that since pathogenic micro-organisms lived in healthy bodies, they are not the cause of disease. In their view, invading micro-organisms could cause disease only after the host organism had been weakened by some physiological or environmental misery." Pasteur and Koch, nevertheless, won deserved plaudits for their technical accomplishments; they and their followers also won extensive financial support from their governments and wealthy individuals alike. In Europe and the United States elite physicians perceived the opportunities opening before them, and leading capitalists showed their appreciation for medical science's ideological role.

Ideologues for capitalist society promulgated the insufficiency of our mastery of nature, the inadequacy of our technological development as the fundamental cause of misery. "The trouble is," Gates wrote Rockefeller, "that the blanket of happiness seems to be too short. If you pull it up at the head you expose the feet; if you tuck it in on the one side you uncover the other side." While there is probably no way to increase the "sum total of human happiness," it is certain that the Rockefeller Institute "is actually and enormously decreasing the sum total of human misery."<sup>^^^</sup>

It is clear whence comes the unhappiness. It comes not from unequal distribution of wealth, sickening working and living conditions, miserable and alienating work, tension caused by frequent and prolonged unemployment, economic insecurity, and competition among those whose sights are set on higher stations in life. "Disease is

the supreme ill of human life," Gates

## Scientific Medicine II I 129

proclaimed, "and it is the main source of almost all other human ills, poverty, crime, ignorance, vice, inefficiency, hereditary taint, and many other evils."<sup>^ ^</sup> It is not poverty or one's place in the capitalist class structure that breeds misery; it is disease that is the cause of the misery commonly attributed to poverty. Misery is a technical not a social problem.

While "the great mass of charities of the world" go around helping an individual poor family or indirectly "relieving or mitigating such evils and miseries of society as are due mainly to disease," the Rockefeller Institute reaches "the root of the evil" and cleanses "the very fountains of human misery."<sup>^ \*\*</sup> This human unhappiness can be eradicated through science and technology. The same forces that helped create America's vast and growing industrial base could be turned to eliminating her misery as well. Gates thus joined with others in "medicalizing" all social problems, defining them out of political struggle and even religious morals, and giving them over to technical expertise and professional management.

Rockefeller money did not support medical research that investigated the relationship of social factors to health and disease. In its first decade, the Rockefeller Institute focused its resources on chemistry, biology, pathology, bacteriology, physiology, pharmacology, and experimental surgery.<sup>^</sup> It ignored the impact of the social, economic, and physical environment on disease and health. In later years, institute researchers touched on the role of nutrition as a contributing factor in malaria and some other parasitic and infectious diseases, but even then they did not extend their conclusions to the actual social conditions in which people lived.<sup>^ ^</sup> Of the more than 650 men and women who contributed their skills to the Rockefeller Institute, few—with the notable exception of Rene Dubos—seemed even to understand the role of society and environment as forces affecting the very diseases they studied.

This orientation to biological reductionism pervaded the Rockefeller medical philanthropies. When Gates, Junior, and other men in the Rockefeller Foundation decided to establish the first public health school in the United States, they selected Dr. Welch and Johns Hopkins University as their vehicles, knowing the new school would have a heavy emphasis on the basic sciences and not stray too far into social issues.<sup>^ ^</sup> Charles Wardell Stiles,

## 130 I Scientific Medicine II

the government zoologist who brought the hookworm to the attention of the Rockefeller philanthropy and was named scientific director of the campaign to eradicate the parasitic disease, exhibited a capacity for keeping his nose to the parasites and not being distracted by social concerns. In an article on "The Chain Gang as a Possible Disseminator of Intestinal Parasites and Infections," Stiles offered not one word of criticism of chain gangs per se. He limited himself to criticizing the lack of privies and bemoaned the missed "opportunities for rigid discipline" that could "make these penal institutions admirable schools in which the State might easily give its charges some good lessons in cleanliness, hygiene, and sanitation."<sup>"" ^</sup>

## GATES' DIGRESSION

Gates genuinely believed in technical solutions for problems of social happiness. But there was another side to Gates. There was a side that recognized the exploitation of labor by capital, that felt compassion for the oppressed men and women of the industrial working class. As a member of the board of directors or chairman of the board of more than a dozen corporations, but not a part of day-to-day management. Gates was never personally involved in labor disputes. From his lofty heights at the top of the Rockefeller financial and philanthropic empires. Gates had a broad view of the needs of his class and a measured strategy for meeting them.

In 1916, two years after the clamorous criticism over the Ludlow massacre and a time when "labor is demanding more wages everywhere," Gates asked himself the strategic question, "shall one oppose this demand or favor it?" In a memorandum for himself, Gates developed his position on "Capital and Labor."<sup>"" ^</sup> First, unionism is

selfish, violent, ignorant, perverse, and mistaken, he believed. Through unions, labor demands "the largest possible wage" and does "the least possible work" whereas the public-spirited citizen, whether wealthy capitalist or poor laborer, does the "largest possible service" and consumes the "least possible amount of the public wealth" by accepting private economy and saving.

Second, the object of labor should be to increase its real wages, not merely get a jump on the next guy. "If a few crafts become thoroughly unionized and secure their demands, it must

Scientific Medicine II I 131

be," Gates observed, "at the expense of all other crafts that are not so unionized." Unions seemed to care little that raising the wages of any one group will result in an increase in the cost of living for all other groups since employers will pass on to workers-as-consumers the increase in wages they grant. The wage earner will have won his battle. Gates concluded, "not merely when he has got his wages, but when he has so got them that they will buy more." Higher wages without a higher cost of living is the object, "and the only way under heaven in which that can be done is by taking the wages out of the returns of the capitalist." Gates believed labor's demand for a greater share of the wealth was just. The laboring classes are "degraded" by the kind of work they have to do, the amount of work required of them, and "the deprivations that they have to suffer." The differences between rich and poor, capitalist and laborer, "are due not to heredity but to environment." The rich and aristocratic have no purer blood than the "misshapen, ill-dressed, half-brutalized men and women" who have worked the mines from childhood.

Shall we hate and despise and look down upon these people whom our social system has made what they are, or shall we pity them and shall we blame ourselves for having made them what they are, for keeping them where they are, and for clothing ourselves with the fruits of their unpaid labor?

Frederick Engels was not more eloquent!

Gates concluded that it was necessary and desirable for capital to voluntarily reduce its return on investments from the prevailing 5 percent to 2 percent and give the balance to the workers.

Cut down their hours of labor. Improve their living conditions. Give them opportunities for music, for pictures, for whatever can cultivate them in mind, whatever can beautify and adorn them in body. Let us ourselves share to some extent the manual labor of the world, and instead of a few rising to the top on the backs of the many, let us undertake to build up society in all its parts as a whole to a higher level.

Gates was moved not by compassion but by fear. He and other members of America's ruling class were shaken by the violent labor struggles, widespread working-class consciousness and support for the Socialist party, and unrest among middle-class Progressives. Most of this class antagonism was aimed at the

132 I Scientific Medicine II

great concentrations of wealth in the industrial monopolies and the flaunting of wealth by the Vanderbilts and the Astors. Always an advocate of inconspicuous consumption, Gates now privately and momentarily looked to corporate-liberal social reforms to head off the anticipated cataclysm.

With the entrance of the United States into the European war, full employment and patriotism overwhelmed the Progressive reform movement and justified repression of the Socialists and militant working-class organizations. The immediacy of the internal threat passed, and Gates abandoned even his private thoughts of redistributing the wealth. Promoting physical and social science research continued unaltered as the primary foundation program for ameliorating misery although the junior Rockefeller developed new programs in the arts to uplift the people's culture.

A PERMANENT INVESTMENT

In addition to the expected material and political benefits of medical science, Gates believed that endowing the

Rockefeller Institute was an ideal investment because of the permanence of its findings. Each generation takes from the past and hands on to the future "only the things that are proven to be permanently useful." The "useless baggage" is dropped and left behind. The one thing that "humanity has got to live with" is "old Nature and her laws in this world," Gates told his friends at the Rockefeller Institute. "These laws do not change and humanity will never outlive them. Whatever we discover about Nature and her forces, and incorporate into our science, that will be carried forward, though all else be forgotten."""^

Despite his naive view of science. Gates viewed endowments for scientific research as permanent social capital, an investment that would continue to return dividends into the distant future. Given his broad and long-range perspective of the needs of capitalist society. Gates was very attracted to this feature of scientific research.

Aside from its permanence, an investment by Rockefeller in an institute for medical research would call forth more money into medical research. This one act of philanthropy would "call public attention to the importance of research" and encourage

## Scientific Medicine II I 133

"many thoughtful men of wealth" to endow research in scientific medical schools throughout the country."^

In the end, private fortunes and public taxes alike flowed in ever-increasing amounts into medical research. In 1911 Gates was pleased that other rich men and women had indeed followed the example of Rockefeller.""^ By the mid-1920s Gates felt assured that his strategy of encouraging public and private grants had paid off. "Never before were the common people so ready to grasp the extended hand of a liberal philanthropy," he told fellow trustees of the Rockefeller Foundation, "and to cooperate by legal enactment, liberal taxation, and private munificence."""^

All this financial support for medical science and the social recognition heaped upon the scientific medical profession by members of the upper class had given physicians a higher and more secure status. Medical research institutes, Gates observed, "have conferred dignity and glory upon medicine," with the consequence that the medical profession was awakening "to a proud and healthy consciousness of the dignity of its vocation." Quite uncynically. Gates believed that "the elevation of the medical profession" would further the interests of the profession itself and help stabilize a sometimes shaky class structure."^ Capitalist society was gaining another firm supporter as the medical profession, cleansed of any social conscience, increasingly recognized its duty to preserve the existing social order.

The philanthropic capitalists who supported medical science believed it would do more than demonstrate their good works. First, reductionist scientific medicine bore a striking, and not incidental, similarity to the capitalist world view. Second, scientific medicine would help integrate all members of society, whatever their occupations or social standing, into an industrial-technical culture, unifying the fragmented and often fragile industrial-capitalist social order. Third, scientific medicine would help replace the widespread class theories of misery with the perspective that inequalities and unhappiness are technical problems susceptible to engineering solutions, thus depoliticizing medicine and legitimizing capitalism. Finally, scientific medicine would help elevate the medical profession, encouraging a stronger identification of its members with the highest class in society and the capitalist order itself.

## 134 I Scientific Medicine II

Gates believed that all these characteristics and consequences of scientific medicine were good for society, just as he considered socially beneficent the accumulation of wealth by Rockefeller and his private decisions as to how it should be spent. Gates' views on the benefits of scientific medicine and medical research were clearly shared in practice by other capitalists, government officials, and members of the profession. Seldom laid out for us with even Gates' minimal explicitness and coherence, their perspectives were nevertheless clear in their programs and articulated concerns. Gates' views on scientific medicine were influential beyond the support given the Rockefeller Institute and encouragement given to other programs of medical research. Gates had the interest, the ideas, and the money at his disposal to formulate and launch numerous programs to develop and

extend public health work and a major program to reform medical education.

### CHAPTER

#### Reforming Medical Education: Who Will Rule Medicine?

By the end of the nineteenth century, American physicians were still complaining bitterly of their "poverty" and low status in American society. Those who had studied in Europe were especially struck by the low esteem in which American doctors were held compared with their German colleagues. The disparity among physicians' incomes left some well off and some poor. As the New York State Medical Society's journal put it, "There is a handsome income for a few, a competence for the many, and a pittance for the majority."^

Most professional spokesmen blamed the relative poverty of doctors on "overcrowding" in the profession. The AMA Journal argued in 1901 that through death and retirement of old doctors and the increase in population, there was "room for nearly 3,300 new doctors each year," but the nation's 160 medical colleges were producing nearly double that number.^

To deal with these problems, the medical profession adopted an effective strategy of reform based on scientific medicine and the developing medical sciences. Their plan was to gain control over medical education for the organized profession representing practitioners in alliance with scientific medical faculty. Their measures involved large expenditures for medical education and required a major change in the financing of medical schools. Dependent on outside capital, the profession opened the door to

outside influence. The corporate philanthropies that intervened turned the campaign to reform medical education into a struggle for control between private practitioners, on the one hand, and academic doctors and the corporate capitalist class, on the other. The conflict over who would rule medical education, to which we now turn, was fundamentally a question of whose interests the medical care system would serve.

## PRACTITIONERS GAIN A FOOTHOLD

By 1900 the strategy evolved by elite physicians to reduce the number of doctors, increase incomes, and raise the social class base of the profession began to pay off. Medical research, despite its limited financial support, was building public confidence in modern practitioners. Reforms were being pressed in some leading universities, setting a new standard that others would soon be forced to follow. Most states had established medical licensing boards, however varied the standards they imposed. The Illinois Board of Health in particular had begun a crude evaluation of all medical schools in the United States and Canada. Its report published in 1889 shook more than a few of the 179 schools of the regular sect, twenty-six homeopathic, twenty-six eclectic, thirteen miscellaneous, and thirteen schools condemned as "fraudulent."<sup>^</sup>

All these advances did not yet resolve two major obstacles to professional uplift. First, medical schools remained unregulated. In the final quarter of the nineteenth century more than 114 new schools had been founded.<sup>^</sup> The finances of medical schools forced their faculties to oppose the reformers' strategy of promoting scientific medicine to reduce output. Medical schools were for the most part small profit-making enterprises, owned mainly by their faculties. The only commodities they could sell were medical degrees. Dependent for their survival as well as their profits on student fees, the schools continued to pour forth their products. Being proprietary in character but profitable only to the faculty directly involved, they were unable to attract outside capital or operating funds to support expensive teaching and research programs necessary to scientific medical education. Thus, "scientific medicine" was taught at only a few university medical schools, and to a limited extent even in those—except for Johns Hopkins, which was far from the norm.

## Reforming Medical Education I 137

The second obstacle to implementing the reform strategy was the organizational disarray of the profession itself. The AMA had failed in its mission. It was by-passed in the last part of the century by specialty societies which formed an alliance in 1888 in the American Congress of Physicians and Surgeons. The American Academy of Medicine and other groups were formed to fill the reform role left vacant by the AMA. Membership in local and state medical societies did not confer membership in the national association, isolating it from the majority of practitioners. By 1900, only 8,400 physicians were members of the AMA.<sup>^</sup> The national leadership, without structural ties to state and local societies, operated within a vacuum. Structurally weak, numerically small, dominated by traditional doctors only half-heartedly committed to scientific medicine, the "voice of the medical profession" seemed to have laryngitis.

Before the medical profession could secure reforms in medical education, it had to strengthen its own organization. After some stalled attempts at reorganization at the end of the nineteenth century, the reformers won support from state medical societies and completely reorganized the AMA at the 1901 convention in St. Paul. The new organization, which continues to this day, made the local medical society the basic unit of the association. Individual physicians would join a local society. The local society would send representatives to a state society, which in turn would elect delegates to the newly formed house of delegates, the legislative body of the national association. The president of the AMA and a board of trustees were given substantial powers. With the campaign skillfully managed by Dr. George H. Simmons, the reform leader recently appointed secretary of the AMA and editor of its Journal, and with the convention sessions presided over by Dr. Charles A. L. Reed, the reorganization plan was instituted without discussion.<sup>^</sup>

The reorganization created a hierarchical, representative structure. The direct line of authority depended on the strength of the local societies, always the strongholds of professional interests. The new structure gave the state and national organizations stable leadership, which could more effectively coordinate and mobilize resources for

the profession's interests. The plan was intended, and succeeded, to federate state societies into the national association and, in the words of the committee on reorganization, "to foster scientific medicine and to make the

## 138 I Reforming Medical Education

medical profession a power in the social and political life of the republic.""

Doctors with a vision of uniting the profession behind a campaign to elevate it moved from the wings onto center stage. George Simmons invigorated the Journal with the mission of the reform movement. AMA leaders asked physicians around the country to spur legislative reforms, control state licensing boards, and goad medical schools into altering their admission criteria and curricula. The increased effectiveness of the AMA brought support and membership from the many specialists who seemed to have forgotten that they were physicians first and surgeons or gynecologists second. Private practitioners of all types rose to support the coordinated local-state-national vehicle for their common interests. By 1910 some 70,000 doctors were AMA members, more than eight times the membership at the turn of the century.

Although many rank-and-file physicians were unhappy with the centralized control emanating from the AMA's Chicago offices and with the reform strategy itself, most physicians undoubtedly supported the movement.^ Most physicians resented the economic and social conditions of the profession, particularly when they realized that things could be better. They understood that competition among physicians for a greater share of the available medical dollars would help only a few and that the interests of every physician were tied to the interests of the profession as a whole.

The reform leadership, representing a coalition of private practitioners and medical school faculty, articulated the desires of most doctors for financial and social uplift, and offered a viable strategy for achieving them. This coalition controlled the \*AMA from the end of the nineteenth century until World War I, sharing the association's presidency and jointly implementing its reform strategy.^

## COUNCIL ON MEDICAL EDUCATION

Once in control of the reorganized AMA, the reformers launched their most effective tool for transforming the profession. In 1904 the AMA replaced its temporary committee on medical education with a permanent Council on Medical Educa-

## Reforming Medical Education I 139

tion, headed by the energetic and resourceful Arthur Dean Sevan, a successful surgeon and part-time professor at Rush Medical College in Chicago. The new council was armed with a staff to help it exert "a national influence and control of medical education."^°

To facilitate that control, it invited state licensing boards to a national conference in 1905 to review the status of medical education and set standards. There the council adopted "an ideal standard to work for in the future"—one that would raise U.S. medical education to the same basis as England, France, and Germany—and "a minimum standard for the time being." The temporary standard was: (1) a preliminary education of four years of high school, (2) a four-year medical course, and (3) passing an examination before a state licensing board."

Bevan urged local and state medical societies to become more active in the reform movement and to see that "the right sort of men" were appointed to the licensing boards. Within two years the state medical societies, under the guidance of the Council on Medical Education, dominated the state boards. Through the influence of the state societies and direct contact by the council, the licensing boards increasingly became agents of the council's plan of action.'^

The more the state boards cooperated with the council to accept diplomas only from medical schools "in good standing" and to gear their examinations to the curricula of scientific medical schools, the more uncertain was the future of all medical schools except those elite schools already geared to the needs of scientific medicine. Those schools that could tap sufficient resources to provide laboratories, "technical material," and scientifically

trained faculty had a reasonably good prognosis. The graduates of such schools were allowed by the state boards to take their licensing exams, and they had a fairly good chance of passing. There was little incentive for students to attend and pay the fees of unapproved schools and schools whose graduates tended to flunk the licensing examinations. But state boards were not uniformly in the hands of the state medical societies, so the council developed a new tactic to upgrade medical education, close more schools, and develop a controlling role for itself in the field.

In 1906 the council inspected every one of the country's 160

#### 140 I Reforming Medical Education

medical schools. Each school was personally visited by council secretary Dr. N. P. Colwell or another council member and was rated on the percentage of its graduates who passed the state licensing exams, enforcement of preliminary education requirements, curriculum, laboratory and clinical facilities and instruction, laboratory science faculty, and whether the school was run for a profit. Reports on each school were sent to the state licensing boards, and the percentage of each school's graduates who failed state board examinations was published in the AMA Journal. ^^

In 1907 the council divided medical schools into classes A, B, and C, depending on their ratings. Of the 160 schools inspected, eighty-two were rated as class A medical colleges, forty-six were class B, and thirty-two class C. The impact of the council's report was significant. Fifty schools agreed to require one year each of college physics, chemistry, biology, and a modern language before admission to the medical program. Sensing doom, a number of schools consolidated with other medical schools in their cities, combining facilities and staffs. Other schools realized that they did not have the resources to survive the heightened competition. By 1910 the number of schools had fallen from a high of 166 to 131.^^

While the practitioner reform leaders were pressing for stiffer standards within medical education, the medical schools themselves were doing their best to survive. The Association of American Medical Colleges (AAMC), representing about a third of all American medical colleges, sought to differentiate its member schools—"the better classes of medical colleges"—from run-of-the-mill schools. They were concerned that rising standards in admission and instruction would bankrupt even the best schools. As the representative of the elite portion of scientific medicine's rear guard—the schools themselves—the AAMC favored cooperation between itself, the Council on Medical Education, and the association of state licensing boards. The AAMC sought uniform minimum standards for all states so that each state's requirements of medical schools would come "up to, but not beyond," the standard recommended by a joint committee of all three bodies. ^^

Although the Council on Medical Education had neither legal powers nor authority within the profession, council chairman Bevan, AMA secretary and Journal editor Simmons, and other

#### Reforming Medical Education I 141

professional reformers well understood the role of leadership and the powerful advantage of articulating a strategy consistent with historical forces. Science's time had arrived in medicine: A middle and upper class whose dominance depended on industrialization was receptive to what scientific medicine advocates within the profession offered. State licensing boards, under the influence or in the hands of the medical societies, assured the dominance of scientific schools and the competitive disadvantages of economically weaker schools. The cost of a scientific medical education was shattering the financial arrangements of proprietary medical schools. The council could not order schools closed, but it rallied political allies in the state boards and the forces of the marketplace to wreck the ancien regime.

#### MONEY FOR MEDICAL EDUCATION: WHO WILL PAY?

The reforms initiated and pressed by the AMA leadership were clearly having their desired impact. But the profession's power to accomplish its ultimate goals was limited. Scientific medicine was an expensive affair. Nearly all medical schools at the end of the nineteenth century relied for most of their support on students' tuition fees. Most independent medical colleges and many of those nominally associated with universities had

no other source of income. Yet the teaching of scientific medicine required expensive laboratory buildings, a teaching hospital and teaching clinic, and equipment. Some of these facilities could be obtained from local men and women of wealth if faculty members had fashionable private practices. Some facilities could be had if the medical school was affiliated with a well-endowed university. However, more than facilities were needed.

The largest operating expense for a scientific medical school was the faculty to teach the laboratory science courses. A practitioner might be good enough to teach clinical courses, but he usually was not expert enough in physiology, bacteriology, or pathology. The basic medical sciences had to be taught by medical scientists who were specially trained in that area and whose on-going research kept them abreast of developments in their field. These faculty had to devote their full time to teaching and research, and they were the largest operating expense of a turn-of-the-century scientific medical school.

The cost of a scientific medical education was beyond the

## 142 I Reforming Medical Education

means of students. "It costs more to educate a medical student," Bevan noted, "than he can pay in the way of fees." ^ The capital investment and operating costs for scientific medical education were also beyond the means of the profession itself. Wealthy physicians might provide a small portion of the capital for a medical college, but the reformers recognized early that most of the capital for scientific medical schools would have to come from outside the profession. ^^ States might be persuaded to support state institutions, but most medical schools and universities—and certainly the most elite—were privately controlled. "The public must be taught the necessities and the possibilities of modern medicine," Bevan argued, and philanthropists must be shown that medicine deserves their endowments. ^^ Because of the amounts involved, much of the money would have to come from the fortunes of the very wealthiest men and women in America. The medical reformers were well aware of the dangers of help from the outside. "Rich men may injure the cause of medical education," the AMA Journal warned in 1901, unless their giving is directed by the profession itself. ^^ With the blessings of the rest of the profession's leadership, Bevan took on the task of getting and guiding endowments for medical colleges. "We must secure for them state aid and private endowment," he told the council's 1907 national conference. "We must start an active, organized propaganda for money for medical education." ^^

## HELP FROM THE CARNEGIE FOUNDATION

Impressed with the impact of the council's own survey, Bevan turned to the Carnegie Foundation for the Advancement of Teaching. He sought the foundation's help, not just to replicate the council's own work, but to add to their campaign the foundation's developing prestige and image of "objectivity." Bevan understood the foundation's potential for molding public opinion and providing a credible blueprint for philanthropists to follow while channeling their money into medical education. It was also clear that an agency outside the profession could openly attack medical schools that resisted reorganizing themselves or going out of business without once again splitting medical school faculty off from the reform leadership. At the council's first

## Reforming Medical Education I 143

national conference in 1905, Bevan criticized proprietary medical schools as an obstacle to reform, but he felt compelled by the need for diplomacy to urge leniency because of the "property and professional interest" invested in them. ^^

In 1907 Bevan invited Henry S. Pritchett, president of the Carnegie Foundation for the Advancement of Teaching, to examine the survey materials collected by the council. Meeting at the Chicago Club, Bevan and Pritchett saw eye-to-eye on the value of a Carnegie-sponsored study of medical education. For Bevan the Carnegie study would be the big guns in the campaign for medical education reform. Pritchett was sympathetic to that concern, but mainly in the context of the foundation's program to reform and rationalize the nation's colleges and universities, including its professional schools. ^^

The foundation had been established in 1905 to upgrade the status of college teachers while creating a uniform system of higher education. Out of discussions between Andrew Carnegie and Pritchett emerged a plan to

advance teaching by the carrot-and-stick method. The new foundation provided an initial endowment of \$10 million to support a retirement program for college teachers. The pensions would be given without any cost to the institution or its individual teachers, but each college must meet the conditions laid down by the foundation. Denominational colleges were not eligible for the pension plan. Religion was, of course, an important moral force, but it would not promote the universality of science; colleges controlled by competing denominations would be more concerned with propagating the faith than with training scientists and engineers. Denominational colleges, hoping to make themselves more attractive to faculty, besieged the foundation with inquiries about how to amend their charters to make themselves eligible for free pensions. In addition, the foundation imposed academic and financial requirements designed to force the poorer colleges to match the academic standards of the better colleges and to make higher education follow a uniform pattern throughout the country."

Thus, Bevan's request for a study of medical schools fit well with the foundation's general program and provided an opportunity for the foundation to move into reforming professional education. Pritchett discussed the proposed study with Charles Eliot, president of Harvard and a trustee of the Carnegie

## 144 I Reforming Medical Education

Foundation, Rockefeller's General Education Board, and the Rockefeller Institute for Medical Research. He also talked with Dr. Simon Flexner, director of the Rockefeller Institute. Flexner suggested a director for the study, his brother Abraham. The suggestion meshed well with Pritchett's conception of the study as contributing to the reform of higher education.^"^^

Abraham Flexner was a professional educator. He got his bachelor's degree from Johns Hopkins in two years of diligent and hard work. He later founded and ran his own college preparatory school in Louisville and afterwards spent a year in advanced study in education at Harvard. While in Heidelberg in the summer of 1908, Flexner wrote *The American College*, which, in his own words, "fell quite flat." Late in the summer of 1908 Flexner returned from Europe unemployed and "prepared to do almost anything." Hoping to get a job, Flexner initiated a meeting with Pritchett. They talked about higher education and its problems and found they agreed on the necessity for reform. "When I next saw him," Flexner later recalled, "he asked me whether I would like to make a study of medical schools." Flexner was enthusiastic, "but it occurred to me that Dr. Pritchett was confusing me with my brother Simon at the Rockefeller Institute, and I called his attention to the fact that I was not a medical man and had never had my foot inside a medical school."

"That is precisely what I want," replied Pritchett. "I think these professional schools should be studied not from the point of view of the practitioner but from the standpoint of the educator. I know your brother, so that I am not laboring under any confusion. This is a layman's job, not a job for a medical man."^^

A report on medical education by a physician would lack credibility, and it would feed the divisions between practitioners and part-time medical school faculty. Moreover, Pritchett, while certainly not adverse to aiding medical professionals, wanted medical education integrated into a general system of education. A report by an educator sold on the importance of a scientific medical profession would provide both the right perspective and credibility.^^

At their November 1908 meeting, Pritchett asked the Carnegie Foundation trustees to authorize the study and appropriate the necessary funds. With their approval, Flexner immediately began his study.^^ Bevan directed the reform campaign, Pritchett

## Reforming Medical Education I 145

financed it with Carnegie's money, and Abraham Flexner implemented it.

## THE "FLEXNER REPORT"

A scholarly technician, Flexner began by reading up on the history of medical education in Europe and America. He went to Chicago to discuss the study with George Simmons, secretary of the AMA and editor of its *Journal*.

He also met with Bevan and Colwell, secretary of the Council on Medical Education. He read Colwell's reports on medical schools and found them "creditable and painstaking documents" but "extremely diplomatic."

Flexner then visited his alma mater, Johns Hopkins, where he met with the medical school's leading faculty members, Drs. Welch, Halsted, Mall, Abel, and Howell. Flexner found Hopkins "a small but ideal medical school embodying in a novel way, adapted to American conditions, the best features of medical education in England, France, and Germany." Hopkins became the living model for Flexner. "Without this pattern in the back of my mind, I could have accomplished little."^^

Flexner saw his mission as translating the Hopkins medical school into a standard against which to judge all other medical education in the United States. All others paled before this "one bright spot." Flexner's praise of Hopkins grew ecstatic:

It possessed ideals and men who embodied them, and from it have emanated the influences that in a half-century have lifted American medical education from the lowest status to the highest in the civilized world. All honor to Oilman, Welch, Mall, Halsted, and their colleagues and students who hitched their wagon to a star and never flinched!"

Flexner visited every one of the 155 medical schools in the United States and Canada. Colwell, of the AMA, went with him to most of them. In nearly all cases, the school administrators and faculty laid bare the facts of their existence—facilities, laboratory equipment, numbers of faculty and their qualifications, numbers of students and their preparation, the curriculum, patients available as teaching material, income from student fees, and endowments.^o

Even administrators and faculty who knew their schools were

## 146 I Reforming Medical Education

deficient in many assets the Council on Medical Education believed important permitted Flexner and Colwell access to facilities, staff, and account books. Many of the schools were run by doctors who were committed to elevating the profession and saw the importance of creating scientific medical schools. Even more persuasive in opening medical schools to inspection was that deans, faculty, and trustees of most medical schools believed that Flexner's visit "would be followed by gifts from Mr. Carnegie to set things right." Whatever fear the medical school deans and faculty had of the consequences of public criticism, they understood that failure to comply with the Carnegie study would result in their rapid demise. The market for medical students was very competitive, and bad publicity would do serious injury. But riskier still were the dynamics of the competitive market. If many competing medical schools that cooperated with the Carnegie study got a large advantage—for example, a new laboratory or an endowment—the financial collapse and demise of the disadvantaged was assured.^ ^

Some colleges resisted inspection, but resistance was grounds for suspicion. To the recalcitrant medical schools, Pritchett let it be known that "all colleges and universities, whether supported by taxation or by private endowment, are in truth public service corporations," and, therefore, the foundation, the medical profession, and the public had a right to know about their finances and educational practices. Rather than fear intervention by outsiders, the leading reformers in the profession savored this attitude of the foundation. Not only did this attitude support their campaign, but it recognized medicine as a vital societal function.^ ^

## flexner's findings

Flexner visited the medical schools and wrote his report in the space of eighteen months. His whistle-stop tour and his acerbic comments on what he saw gave him a reputation, even among medical reformers, for being "erratic" and "hasty in judgment." The medical faculty at Harvard were insulted and in return cast aspersions on his ability while the faculties at lesser schools merely bristled."

Not coincidentally, Flexner's criticisms of American medical schools and his recommendations for reform were perfectly

consistent with those of the leading medical profession reformers. Flexner attacked medical schools for producing too many doctors, for requiring too little education before admission to medical school, for having inadequate facilities and faculty and providing inadequate training, and for creating a social composition for the medical profession that was inappropriate to its important social role.

Flexner and Pritchett both attached great importance to medicine's changing role in society. The physician's function in society, traditionally "individual and curative," was rapidly becoming "social and preventive."<sup>147</sup> If "society relies" on doctors for important social functions, then "the interests of the social order" must be considered first in any public policy for reforming the profession.<sup>148</sup> What was wrong with the medical profession from society's point of view?

Overcrowding was the most serious problem with the profession, according to Pritchett and Flexner. If Germany could thrive with one doctor for every 2,000 inhabitants, then the United States, with an average of one doctor for every 568 persons, suffered from a severe oversupply of physicians. Overcrowding forces professionals into competition with one another, fighting for a relatively inelastic market of patients and encouraging one another to perform unnecessary services to increase their incomes. Overcrowding "decreases the number of well-trained men who can count on the profession for a livelihood," reducing the attractiveness of a medical career to competent men. "The country needs fewer and better doctors," Flexner argued, and "the way to get them better is to produce fewer."<sup>149</sup>

The main reason for the overcrowding of the profession, as well as for its generally low standards, was the prevalence of "commercial" medical schools. Only fifty of the 155 medical colleges were integral parts of universities. The rest, whether independent or nominally affiliated with a university, were in reality run by the medical faculty alone without any outside control. These proprietary schools depended on students' fees, which were divided up among the local practitioners who were lecturers in the school. Many of the faculty fattened their incomes through "the consultations which the loyalty of their former students threw into their hands." Faculty chairs in the commer-

## 148 I Reforming Medical Education

cial schools were bought and sold, sometimes for as much as \$3,000.<sup>150</sup>

Commercial medical schools dragged down medical education in its entirety, argued Flexner. Their incomes based entirely on student fees, the schools tended to admit as many students as possible and to reduce their expenses as much as possible. Since lectures were the cheapest form of education—in which the income from student fees went directly to the faculty instead of being invested in buildings, laboratories, or equipment—medical education came to consist almost entirely of lectures until the 1880s. The necessity of laboratory and clinical training for the scientific medical doctor greatly strained the resources of proprietary medical schools. The choice was clear. "The medical profession is an organ differentiated by society for its own highest purposes, not a business to be exploited by individuals according to their own fancy."<sup>151</sup> To assure its public service character, medical schools must be made integral parts of universities.

The social importance of the medical profession meant not only that medical education should not be left to proprietary organization, but that it should be reserved for those who could afford "a liberal and disinterested educational experience." Proprietary medical schools, with their admission requirements of four years of high school or its "equivalent," attracted "a mass of unprepared youth . . . drawn out of industrial occupations into the study of medicine." Neither "the crude boy" nor "the jaded clerk" were suitable material for a career in medicine.<sup>152</sup> Flexner proposed a minimum two years of college for admission to medical school at a time when only 15 percent of the high school age population was enrolled in high school and only 5 percent of the college age population was enrolled in a college or university.<sup>153</sup>

Consistent with the racism of his period, Flexner argued that "the practice of the Negro doctor would be limited to his own race." However, "self-protection not less than humanity" should encourage white society to support

improved training for black physicians: "ten millions of them live in close contact with sixty million whites." In addition, the importance of black physicians in facilitating "the mental and moral improvement" of their race required creating an elite core of scientific black doctors. Applying the formula of "the fewer, the better," Flexner

## Reforming Medical Education I 149

recommended that of seven black medical schools then in existence, only Meharry and Howard be continued/\*

Flexner also recommended closing the three women's medical colleges. Schools for women alone were unnecessary and inefficient since "medical education is now . . . open to women upon practically the same terms as men." If the number of women medical students was declining, it demonstrated a lack of either "any strong demand for women physicians or any strong ungratified desire on the part of women to enter the profession," or both. Flexner seemed to believe, with most of his peers, that women are seldom equipped for the mental rigors of medicine and, if middle or upper class, women make better patients than doctors."\*^

The very clear consequence was to be an across-the-board reduction in the production of doctors, with especially large reductions in the numbers of poor and working-class young men, blacks, and women entering the medical profession. The social class and status of medicine would be raised, together with the incomes of physicians, to a level appropriate to its role in society. These changes were made necessary, according to Flexner, by the requirements of scientific medicine as well as by medicine's new social role.

Flexner found that only twenty-three of the country's 155 medical schools required two or more years of college preliminary to medical school. And 132 schools admitted students with a high school education or its "equivalent." The latter would be a tolerable "temporary adjustment" where there were not enough college students to fill the medical school openings, but two years of college provides "the varied and enlarging cultural experience" necessary to a modern physician.'\*^

Instruction in biology, chemistry, and physics should be required before the student could enter medical school. The medical college curriculum was to proceed from there. In the first two years the student would study anatomy, physiology, bacteriology, pathology, and pharmacology. With this thorough grounding in the laboratory sciences, the student would spend his or her third and fourth years in supervised clinical study. Only the better medical schools, affiliated with universities and requiring two years preliminary college education, provided the model curriculum.\*^

## 150 I Reforming Medical Education

Flexner's report thus sought to place medical education on a uniform basis consistent with the needs of scientific medicine and to elevate the status of the medical profession to a position consistent with its important social role. This mission required eliminating both proprietary schools and the lower classes, restricting the opportunities of women and blacks to enter the practice of medicine, as well as increasing the preliminary requirements and standardizing the curriculum into a graded, four-year program. Reducing the supply of physicians was no mere by-product of Flexner's program. "The improvement of medical education cannot," he argued, "be resisted on the ground that it will destroy schools and restrict output: that is precisely what is needed."\*\*^

Flexner's analysis and recommendations were strikingly like those of the leading reformers of his time within the profession. For at least a decade before Flexner's report was published in 1910, medical journals argued that the profession was overcrowded and that improving medical education was the best means of restricting output. "We raise the standard of medical education year by year, yet the mushroom colleges do not go," Frank Lydston complained to his colleagues in 1900. "We have done the best we could to breed competition by manufacturing doctors."\*\*^

In 1901 the AMA Journal warned that the growth of the medical profession should be stemmed "if the individual members are to find the practice of medicine a lucrative occupation."\*\*^ And in 1905, Council on Medical Education member V. C. Vaughan told the council's first national conference that "the supply quite equals the demand, and for this reason the time is propitious for raising the barrier to admission one notch

high-gj. "48 yj^g argument that medical students should be drawn only from the better classes hkewise did not originate with Flexner."\*

At their 1905 national conference and in the following year, the council had urged a temporary preliminary education requirement of high school graduation and one year each of university physics, chemistry, and biology. The council had also recommended a curriculum of four years, with anatomy, physiology, pathology, pharmacology, and bacteriology in the first two years and supervised clinical study in the last two.^o

Strict university affiliation had been a cornerstone of the medical education reform movement for at least forty years by

## Reforming Medical Education I 151

the time Flexner published his report. The university affiliations of most nineteenth-century medical colleges provided the medical school with prestige and legitimacy and gave the university credit for having a medical school, but there were few administrative or academic ties. Charles Eliot, when he assumed the presidency of Harvard in 1869, asserted the authority of the university over the medical faculty and turned the medical school over "like a flapjack," in the words of Oliver Wendell Holmes, then a faculty member in the school. Eliot's new regime raised entrance requirements, instituted scientific medical courses, and forced the faculty to submit to the normal university administrative and academic authorities. Eliot hoped to attract an endowment by demonstrating that the medical school was no longer a private venture "for the benefit of a few physicians and surgeons." His plan was successful. Subordination of the medical school to the university became a key plank in the platform of medical education reformers.^'

The coincidence of Flexner's and the profession's analysis and recommendations could be due to the compelling claims of scientific medicine. That is, any two investigators of the medical profession at that time might have been led to more or less the same conclusions because, within the strategy of developing medical science, the deficiencies of the profession and medical training were obvious. But the relationship of Flexner to the profession was close. His brother was director of the country's leading medical research institute, and he consulted at great length with the AMA leadership throughout his study.

In fact, it was explicitly understood from the beginning that the Carnegie study would be part of the council's campaign, lending credibility to the council's plans for reforms. Six months before Flexner's report was published, Pritchett, president of the Carnegie Foundation, wrote Bevan:

In all this work of the examination of the medical schools we have been hand in glove with you and your committee. In fact, we have only taken up the matter and gone on with the examination very much as you were doing, except that as an independent agency disconnected from actual practice, we may do certain things which you perhaps may not. When our report comes out, it is going to be ammunition in your hands."

## 152 I Reforming Medical Education

Bevan, anxious to start getting mileage out of the Carnegie study, wanted Flexner and Pritchett to speak at an AMA meeting several months before the report was to be published. Pritchett was concerned that if the conspiracy between the foundation and the AMA was made visible—and especially before publication—the report would lose some credibility, and the foundation's "disinterested" image would be tarnished. "It is desirable," he privately added to Bevan, "to maintain in the meantime a position which does not intimate an immediate connection between our two efforts."

This sort of deception increased the credibility of the Flexner report, but it was not essential to the transformation underway. It merely helped along the social and economic forces already in motion.

## IMPACT OF THE REPORT

When the Flexner report was published as "Bulletin Number Four," the Carnegie Foundation found itself the object of "more stone-throwing than was to be expected" for its association with the "Medical Trust"—the AMA

and its Council on Medical Education. Pritchett was embarrassed by the "somewhat dogmatic appearance" of the report which lent credibility to charges of collusion with the AMA, but Bevan and the AMA felt "very much flattered by such an association." Regardless of how Pritchett felt about the public impugning of the foundation's reputation, neither he nor the foundation backed down from its support for the AMA."

Pritchett did not consider that aligning his foundation with the medical professionals might compromise the foundation's larger objectives. Only in 1913 did he begin to see a conflict developing between the profession's objectives of closing medical schools right and left and the foundation's goals of rationalizing higher education and providing for a professional group to fulfill an important function in society. The council's demand for one year of college preparation for admission to every medical school in the country did not take account of regional differences and especially the relative backwardness of the South. Pritchett feared that the very classification scheme that so impressed him in 1907 was being used to set medical education off from the rest of

### Reforming Medical Education I 153

the school system, rather than gradually pressuring the lower schools to meet the preliminary training needs of the medical schools. He accused the council of disregarding "the educational results which the school system itself can turn out," and he warned that "your power will quickly disappear if you advocate courses which are educationally indefensible."^^

Pritchett gradually came to realize that the medical profession's interests would lead it to actions that conflicted with the interests that the foundation wanted to further. By 1918 it was clear to Pritchett that the AMA would wreck all medical education for blacks if left to its own devices. Believing in the social importance of black doctors among black people, the Carnegie Foundation was supporting the Meharry medical school while the council was rating it a class B school. Pritchett protested the "grave injustice done to the negro [sic] schools" by the council's de facto policy of not extending to them the same leniency given to white schools in the South. The policies of the zealous AMA reformers were closing medical schools and disrupting the attempts to build a uniform school system, all without regard for the public interest as defined by the leading foundations. Pritchett threatened to call a meeting of his and the Rockefeller foundations, representatives of some licensing boards, and the dozen "stronger medical schools" to force the council to "revise its present classification of medical schools."" Within a decade of his cordial meeting with Bevan at the Chicago Club, Pritchett had come to view the council's power in much the way Dr. Frankenstein viewed his own creation.

Pritchett's dismay at the council's use of its power was undoubtedly made more painful because of the influence exerted by the Carnegie report. It is sometimes forgotten that the report did not create the movement for medical school reform. The movement for scientific medical education had borne its first fruit four decades earlier. Charles Eliot had led the reform of the Harvard medical school beginning in 1870. Also in the seventies the first teaching hospital was founded by an American university in Michigan, state medical licensing boards were reestablished, and the Illinois board had begun a series of influential reports on medical schools. The Council on Medical Education's own survey of medical schools in 1907 was, of course, the model for Flexner's study and had a substantial impact itself. The pro-

### 154 I Reforming Medical Education

fession's increasing control of state boards made rapid "progress" possible. ^^

Flexner noted that even before his study was published, great strides had been made in reforming medical education. Medical school programs had been extended to four years, clinical teaching had been added to didactic methods, laboratories were widely available and had been expanded, admission standards had been adopted and were held up to with varying degrees of commitment, and state boards—the police power behind the reform movement—had been created in most states. The consequences of these changes were admirable. The number of medical schools was declining, he noted, and independent and commercial schools were rapidly giving up the ghost."

Flexner's report thus aided a process already underway. The rate of consolidation and elimination of medical

schools was as rapid before the report as after. Between 1904 and 1915 some ninety-two schools closed their doors or merged, forty-four of them in the first six years to 1909 and forty-eight in the second six years to 1915.<sup>^^</sup>

Cut off from sources of funding, in part by Flexner's recommendation, the five disapproved medical schools for blacks soon closed. With racism as rampant in white medical schools and medical societies as throughout the rest of the society, medical care for blacks declined even further. In 1910 there was one black doctor for every 2,883 black people in the United States (compared with one physician to every 684 people for the nation as a whole), but by 1942 the ratio had grown further to one black physician for every 3,377 black people.<sup>^</sup> Flexner's attitude toward women in medicine, more extreme than the views of many of his contemporaries, certainly contributed to keeping women at an average of less than 5 percent of all medical graduates from 1900 until World War II. Today women constitute about a fifth of all medical students and blacks about 6 percent, both far less than their proportions in the population but substantially higher than a decade earlier because of the recent struggle for an affirmative action policy in medical school admissions.

Flexner's report also contributed to eliminating sectarian medical colleges. Scientific schools no longer called themselves "regular." By 1932 Arthur Dean Bevan was able to say apprecia-

## Reforming Medical Education I 155

tively, "We were, of course, very grateful to Pritchett and to Flexner" for enabling "us to put out of business" the homeopathic and eclectic medical schools in existence in 1910.<sup>^^</sup> Flexner's contribution was not as substantial as Bevan remembered: The 31 homeopathic and eclectic schools surviving in 1910 were down a third from their number in 1900.<sup>^\*</sup>

The report's direct impact on the profession was moderate, but its consequences were indirectly monumental. As Flexner himself pointed out, the report spoke to the public on behalf of the medical reform movement. It helped "educate" the public to accept scientific medicine, and, most important, it "educated" wealthy men and women to channel their philanthropy to support research-oriented scientific medical education. The Flexner report and the Carnegie Foundation's support brought economic and political power into the war as partisans of the "regular" doctors cum-scientific medical men.

Within a year following the report's publication, the General Education Board entered the fray in earnest. By 1920 the GEB had appropriated nearly \$15 million for medical education and by 1929 a total of more than \$78 million. By 1938 contributions from all foundations to medical schools exceeded \$150 million.<sup>^^</sup> The frequently used matching grant policy, requiring the recipient institution to raise an equal sum itself, greatly increased the impact of their funds. Because the foundation grants were conditional on specific reforms in the medical schools, the foundations exerted a major influence. They forced schools to adopt a research orientation, required teaching hospitals to subordinate their autonomy and patient care to the needs and authority of a university medical school, and established salaried clinical professorships.

The foundations' power was in providing the outside capital for the reform of medical education and the profession itself. As the suppliers of that capital, they were able to dictate terms to the profession. In the earliest years, however, it was the profession that defined the goals and the strategy. The Carnegie Foundation had provided its resources to the leading medical professionals. The Flexner report united the interests of elite practitioners, scientific medical faculty, and the wealthy capitalist class. The report validated the elite professionals and enabled them to speak to philanthropists with a single voice, amplified by the Carnegie

## 156 I Reforming Medical Education

Foundation. Without the Carnegie report, the fears of "misdirected generosity," voiced by the AMA Journal in 1901,<sup>^^</sup> might have been even more justified than they turned out to be.

## THE GENERAL EDUCATION BOARD: MEDICAL EDUCATION GETS A DIFFERENT DRUMMER

While Pritchett was parrying blows from critics and soaking up support from the medical profession reformers,

Flexner was sent abroad by the foundation to study European medical schools. Back home in New York in the spring of 1911, while he was writing the report of his personal investigation, he was invited to lunch by Frederick T. Gates.

As Flexner recalled the momentous meeting years later, Gates complimented him on Bulletin Number Four and asked him, "What would you do if you had a million dollars with which to make a start in reorganizing medical education in the United States?"

"Without a moment's hesitation" Flexner recommended giving it all to Welch and the Johns Hopkins medical school. Flexner could not have recommended anyone in medicine more dear to Gates' heart. Gates asked Flexner to obtain a leave for a few weeks from the Carnegie Foundation to go to Baltimore as an agent of the General Education Board and report back on his findings at Johns Hopkins. Flexner was delighted and went off to Baltimore assured that the million dollars was available.^^

In Baltimore Flexner went directly to Welch and explained that the GEB might add a million dollars to the Johns Hopkins medical school endowment and that he was there to study the situation and report back to Gates. Welch arranged a dinner that night at the Maryland Club and invited two of Hopkins' most illustrious medical faculty, Franklin P. Mall, an anatomist who in effect represented the medical science faculty, and William S. Halsted, a surgeon and de facto representative of the clinical faculty.

Mall spoke without hesitation: "If the school could get a sum of approximately \$1 million, in my judgment there is only one thing that we ought to do with it—use every penny of its income

Reforming Medical Education I 157

for the purpose of placing upon a salary basis the heads and assistants in the leading clinical departments." That, Mall added, "is the great reform which needs now to be carried through.""

Mall's suggestion was the focus of Flexner's report to Gates. Flexner recommended a grant of \$1.5 million to reorganize the medical, surgical, obstetrical, and pediatric departments, placing the clinical faculty on a full-time basis. The "full-time plan" would require the clinical faculty, at that time earning roughly \$20,000 to \$35,000 a year from consultations, to become salaried employees of the medical school and to turn over all their consultation fees to the school. Incomes would thus drop to \$10,000 for a department head, still a very high salary for the period, and \$2,500 for his assistants.

Flexner's report, in the same tradition of thoroughness as his Bulletin Number Four and Gates' own reports to Rockefeller nearly two decades earlier, greatly impressed Gates. The recommendation was informally adopted as policy, and, at Gates' request, Flexner returned to Baltimore and personally explained it to Welch and gave him an informal and confidential assurance that a Hopkins application for \$1.5 million to institute the reforms would be approved by the GEB. It would be up to Welch to convince his faculty and the university trustees to make the reform, for it was to be the only basis of the GEB's grant. "No pressure was used," Flexner recalled, "no inducement was held out." Just \$1.5 million.^^

When Flexner brought the proposal to the GEB, the full-time plan already had a powerful advocate within the board. Three years earlier Gates had been instrumental in establishing the strict full-time provision for physician-researchers at the Rockefeller Institute's new hospital.^" With a view to the needs of maintaining and further developing capitalist society. Gates believed the full-time plan would encourage the application of science to medicine and reduce the independence of the medical profession.

Gates, a director of industry, finance, and philanthropy, believed, as did other men in his position, in the usefulness of science and technology. Science could discover the causes of diseases, and technology could develop the means to prevent or cure disease. But medical science could neither relieve the misery of the world nor make the work force healthier if people could

158 I Reforming Medical Education

not afford its services. Likewise, the cultural and legitimizing functions of medicine could not be performed if medical services were priced out of the reach of the working population. The financial independence of the medical profession was an obstacle to bringing the benefits of science to the people. "This practice of fixing his own price granted to American physicians by custom," Gates wrote to the other GEB trustees, "is the greatest present American obstruction to the usefulness of the science of medicine. For it confines the benefits of the science too largely to the rich, when it is the rightful inheritance of all the people aUke, and the public health requires they have it."^\*

Commercialism was fine in the economic sectors that should be reserved for profit making, but in medicine it violated the needs of capitahst society. The full-time plan was adopted by the GEB as its central policy in medical education to help bring the medical profession to heel and subordinate its practices to the needs of industrial capitalism for fully accessible medical care, or, as board member Jerome D. Greene put it, to abate "commer-ciaHsm in the medical profession."^^ If the elite, standard-setting medical schools supported by the GEB adopted the fixed-price schedule for medical services. Gates argued, "public sentiment, in no time, will enforce those schedules, if reasonable, not only throughout their cities but other cities and finally the country at large."«

The full-time plan played a central role in foundation funding of medical education for the following important decade of development. The new arrangement altered the relationship of the medical profession to university medical schools. And it caused deep divisions between the reform-minded elite practitioners in the medical societies and the Rockefeller philanthropies.

## FULL TIME: "GOLD OR GLORY"

As Flexner himself has pointed out, the full-time plan for clinical faculty was suggested to him by Mall, though it had first been advocated publicly in 1902 by Lewellys F. Barker, a former colleague of Mall's at Baltimore and then a professor of anatomy at Chicago."^ The earlier origins of the idea can be traced to more obscure beginnings in German medical laboratories, but its introduction to the United States is of interest here.

## Reforming Medical Education I 159

The full-time plan was first instituted in the United States in 1893 when the Johns Hopkins medical school opened its doors. Because of the new school's emphasis on research and the widespread experience that local practitioners do little research in the laboratory sciences, the university provided full-time faculty positions in anatomy, physiology, pathology, and pharmacology. The models for the Hopkins reform were the German medical laboratories and universities where Welch and the other Hopkins medical faculty got their scientific training. For some of the new faculty who had previously spHt their time between private practice and teaching laboratory sciences, the Hopkins plan meant giving up an income of \$10,000 a year or more, in return for a salary of \$3,000 or \$4,000. But the bright young men who were actively recruited were, like Welch and Mall, struggling to survive without private practice.^ For these men, medicine was science and laboratories, not patients and housecalls.

Welch himself had never wanted to be a physician. After graduation from Yale, he wanted to be a tutor in Greek, but the prospect of unemployment thwarted his ambition and drove him to follow his father into medicine. His interest in medicine soon bloomed though not with visions of a bedside practice. Welch was "fired in the dissecting and autopsy rooms with the desire to become a professor of pathological anatomy," wrote Simon Flexner, "to study and examine for the rest of his life without having to make his living as a practitioner." The development of scientific medicine in the United States opened to Welch the possibility of a new kind of medical career, and he ambitiously set about building a future for himself in the medical sciences. Returning from his postgraduate medical studies in Europe, Welch, with a little financial help from his friends, founded the first pathology laboratory in the United States at Bellevue Hospital medical school in New York. From there he was invited to Johns Hopkins by president Gilman as one of the first full-time faculty in the laboratory medical sciences and was soon made dean of the distinguished medical school. Welch devoted his life to building the first medical center "empire," seeking favor with philanthropists, initiating reforms in medical education and research, and planning and organizing new programs and institutions."^

Franklin Paine Mall, after receiving his medical degree from the University of Michigan in 1883, went to Germany for

## 160 I Reforming Medical Education

additional clinical training and came back a dedicated medical scientist. In Ludwig's and other laboratories Mall learned to love science and to appreciate the freedom to study what interested him. In his anatomy laboratory at Johns Hopkins, Mall was an efficient and organized administrator. He knew the investments of all the major universities and foundations and was good at bringing research grants to his laboratory. Mall put great value on original research as part of the training of physicians. If dissertations were required for the M.D. degree, he urged hopefully, "it would stimulate scientific work in the medical schools, would tend to reduce the number of graduates, and would improve the quahty of the physician."""^

It was Ludwig in Germany who put the bug about full-time clinical teaching into Mall's ear. Mall brought it back to Baltimore and Chicago and spread the idea among Barker and other colleagues. Mall saw the struggle over the full-time plan as a contest between the clinical faculty and practicing physicians, on the one hand, and the laboratory science faculty, on the other. Reform practitioners had demanded full-time laboratory faculty for the first two years of basic science in medical school, and now "it falls to us to demand of the last two years of medicine what they demanded of the first two." With a sense of victory occasioned by the GEB's proposal to Hopkins, Mall added that "the day of reckoning is at hand." The lesser salaries of full-time faculty should not deter brilliant men and women from entering the field. As Mall liked to put the issue, a physician must choose "which 'G' to worship—Gold or Glory."

Other laboratory science faculty had similar motivations. Many were undoubtedly drawn to the medical sciences partly by the field's growing prestige, partly by their interest in the single-minded pursuit possible in a laboratory, and partly for escape from hustling patients and dealing with the mundane business of medical practice.

To the laboratory scientists, limiting clinicians to their salaries would accomplish several things at once. First, they believed that medicine should be fundamentally a science devoted to finding the bio-physical causes of disease and less an art of bedside diagnosis and hopeful therapies. Second, since the medical sciences prospered most with faculty devoting themselves entirely to research and teaching, it followed in their thinking that clinical

## Reforming Medical Education I 161

instruction would also benefit from the clinical faculty's singular devotion to research and teaching. Third, since the medical school competed with the clinicians' private practice for their time and energy, eliminating private practice would unify and rationalize the organization of the medical school. CHnicians would no longer be responsible to an outside practice. Finally, eliminating clinicians' private practices would unify the material interests of all the faculty in the medical school. Clinical faculty, leaving behind large and fashionable private practices, would derive their incomes and reputations from the same source as the laboratory faculty. From at least the days of Benjamin Rush, practitioners had used their faculty positions in medical schools to build large, prestigious, and very lucrative private practices. The proposed full-time plan would reduce such practices, making the main clinical faculty captives of the medical school, with loyalties no longer divided between personally lucrative consultations and the needs of the school for research and teaching.

Some practitioners as well as academic doctors were mindful of the need for faculty who would commit themselves mainly to teaching. As early as 1900, the AMA Journal argued that clinical departments should be headed by physicians "who are properly paid and of whom more may be demanded than of those who regard their clinical services merely as a means of rapidly acquiring a large private clientele."^^

But as news of the Hopkins plan spread, the outrage among private practitioners grew. The AMA appointed a special committee on the reorganization of clinical teaching. Its chairman, Victor Vaughan of Michigan, tried to steer a middle course, rejecting extreme involvement in private practice by clinical faculty while expressing the

committee's considerable skepticism of the full-time plan. Vaughan concluded that even if the plan were ideal, it would not be feasible for any but a few medical schools that were well endowed.<sup>^^</sup>

Many clinical faculty charged that full-time medical school faculty, based in laboratories and wards, made "poor practitioners" because they were more concerned with research than with patients as suffering human beings. They claimed that without a private practice a physician would lose touch with the real practice of medicine and be a poor example for medical students. WiUiam Osier, the renowned professor of medicine at Hopkins

## 162 I Reforming Medical Education

who had introduced a number of reforms in clinical teaching, had always been an advocate of "medicine as art" as well as science. He frequently argued with Mall, who conceived of medicine as simply a research science. When Osier left Hopkins for Oxford in 1904, he bitterly conceded to Mall, "Now I go, and you have your way."<sup>^^</sup> The initiation of the full-time plan at Hopkins must not have surprised him, and he wrote from England his severe criticisms of the proposed change. Similarly, the highly regarded Society of Chnical Surgery, including such celebrated surgeons as Charles Mayo and George W. Crile, registered their opposition to the plan. Other general and specialty societies joined the chorus."<sup>^</sup>

Practitioner attacks on the full-time plan exposed their ideological, material, and political differences with academic physicians, particularly the laboratory scientists. Although the practitioners' and academics' common interest in promoting scientific medicine had united them at the end of the nineteenth century, differences quickly developed as to just what that meant. Academics differed with practitioners over the relative weight of science and art in medicine, the financial interests of practitioner-clinicians, and who should control medicine.

Medical scientists and their foundation alHes believed that medicine was at its best as an exact science, isolating variables in the laboratory and finding a cure under very precise laboratory conditions. Practitioners, in the business of selling cures to patients, seldom saw the relevance of laboratory controls to treating individuals in the real world. With all their deficiencies, the proprietary schools had, in the words of Rosemary Stevens, "at least been firmly attuned to the average practitioner."<sup>^^</sup> The medical ideology implicit in the full-time plan was now driving practitioners and academics apart.

Whether the practitioners were driven more by their commitment to practice or by consideration for their bank accounts is, of course, a moot question. The issues were so intertwined that it was never clear whether the argument that medicine is an art was simply a ruse to hide pecuniary motives. Clinicians fiercely defended their material interests against the infringements of the full-time plan. Arthur Dean Bevan denounced the plan as "unethical and illegal" because it deprived clinical faculty of their fees.<sup>^°</sup>

Finally, the full-time plan exposed a poHtical conflict that

## Reforming Medical Education I 163

grew out of the different material conditions of practitioners and academics. The AM A sought to control medical education as a vehicle for controlling entry into the profession and thereby medical care itself. The scientific medical school faculty, on the other hand, thought that they should control medical care. Medical scientists, remarked a prominent British physiologist in 1914, ought to "remodel the whole system so as to fight disease at its source. . . . Surely it is a time when those who have laid the scientific foundations for the new advances should take counsel together, assume some generalship, and show how the combat is to be waged."<sup>^^</sup> The Rockefeller philanthropists clearly sided with the medical scientists and cast their weighty fortune with the armies of academe.

Behind the passion of the AMA's attacks were the realizations that the position of medical faculty would no longer be a lucrative supplement for private practitioners and that the full-time clinical faculties' main loyalties would be to medical schools and not the organized profession. Elite practitioners would now have to choose either a grand income or a respected teaching and research position. But even more important to the strategy for controllhng medical education, the full-time plan, by reducing the clinician's income and monopolizing his loyalties and material interests in the medical school, would cut the clinical faculty off from private

practitioners. Instead of linking together the interests of the ehte practitioners with those of the medical schools, full-time clinical faculty would help separate the medical schools from the organized private practice profession. The full-time plan would reduce the power of the organized profession, in particular, the AMA and its Council on Medical Education, within the medical schools.

Of course, things were different in the 1910s from the way they had been at the turn of the century. The profession's reform strategy had accomplished much of what it set out to do: It had established scientific medicine as the ascending model of medical practice and education; it had reduced the number of schools considerably and thereby the output of new physicians; and it had secured supportive legislation and licensing laws. But the plan had just begun to work, physicians' incomes and prestige were rising, and the end was not in sight. Medical schools were still considered key to the strategy and to continued control by the organized profession of its own material conditions. And the

## 164 I Reforming Medical Education

AMA leadership was not about to let that control slip from its grasp. The profession launched a campaign to discredit and oppose the full-time plan.

## SELLING THE FULL-TIME PROPOSAL

Welch, an astute medical politician, anticipated the furor the plan would provoke. Four years before Mall suggested the idea to Flexner, Welch had called for reforms that would allow clinical department heads to "devote their main energies and time" to teaching and research, "without the necessity of seeking their livelihoods in a busy outside practice and without allowing such practice to become their c/z/^/professional occupation."^^

When the GEB proposed to fund full-time organization of Hopkins' clinical departments, Welch faced the dilemma of mediating the interests of the laboratory science faculty with those of the clinicians. Welch asked the GEB to allow some exceptions to the full-time rule, enabling the university president or "some other responsible authority" to permit some full-time, salaried professors to keep their consulting fees.\*^ The board adamantly refused to allow any exceptions.

The laboratory faculty unanimously endorsed the plan, but, Flexner later recalled, "there was a rift among the clinicians."^^ Within two years Welch won sufficient support from the clinical faculty. Lewellys Barker, the Hopkins professor of medicine who had publicly advocated the full-time plan in 1902, stood in the way of its implementation at Johns Hopkins. He chose "gold" over "glory" and resigned his professorship, agreeing to become a "clinical professor," drawing a small salary from the medical school but being able to devote most of his time to a lucrative private practice. In his place, Theodore Janeway gave up his chair at the College of Physicians and Surgeons and an elite practice in New York to become the first full-time professor of medicine in the United States. William Halsted was named professor of surgery and Charles Howland, professor of pediatrics. In October 1913 Welch formally applied for the grant, accepting the condition that the full-time clinical faculty at all ranks—assistant professor to professor—would "derive no pecuniary benefit" from any professional services they rendered. The board immediately voted its approval and a grant of \$1.5 million.^

## Reforming Medical Education I 165

Three months later the GEB decided to devote all its funds in medical education to "the installation of full-time clinical teaching." Flexner had been hired by the board to administer their program in medical education, and he applied himself with his usual energy/^

Within a year Welch reported that "the full-time system is a great success" at Hopkins.^ Halsted and Rowland found the system to their liking, but Janeway resigned his position in 1917 to return to private practice in New York. He was dissatisfied with the full-time arrangements, he wrote in a widely publicized journal article, both because "outside engagements" had been a major source of clinical knowledge to him and because he and his family were used to a higher standard of living than he could afford on his salary. It was "unnatural and repugnant to the patient's sense of justice," he said with great sympathy for his patients, "that a consulting

physician should not receive the usual fee for such service."\*\*^

In 1919 even Osier backed off from his opposition. He asked Welch to use his influence to persuade the GEB to "help McGill start up-to-date clinics in medicine and surgery." Osier made it clear that he did not favor the full-time scheme, but he believed it was now necessary at the Canadian school because "new conditions have arisen" which would leave McGill behind the other first-class schools that had instituted full-time teaching in medicine and surgery.\*^

Over the next few years the board voted more than \$8 million from its general funds for similar reorganizations on a full-time basis of the medical schools at Washington University at St. Louis, Yale, and the University of Chicago. With the matching grant policy, these funds represented several millions more in support for the reforms. Between 1919 and 1921 Rockefeller, Sr., contributed \$45 million to the General Education Board specifically for medical education.

The first appropriation from this special fund was a grant of \$4 million to Vanderbilt University to make the Nashville medical school a model for the South. The GEB considered Nashville its "strategic point" in the South and Vanderbilt the institution that would lead the drive to improve Southern "public health and industrial and agricultural efficiency."^° By 1960 Vanderbilt, the board's major white university in the South, received a total of \$17.5 million from the GEB for medical education. Meharry

## 166 I Reforming Medical Education

Medical College, the board's model black medical school and one of only two that Flexner had argued should survive, received less than half the sum given to the white institution.^' Despite its relative stinginess toward black medical education, the board firmly believed that scientifically trained black doctors were necessary to improve the health of blacks, protect the health of neighboring whites, and provide an elite and "responsible" leadership for the black population. Through its annual grants to Meharry, it exerted substantial control and even instituted full-time teaching in medicine and surgery in the 1930s, with approved white faculty members in charge and a hand-picked white president.^ ^

The board used its \$45 million to foster, if not force, acceptance of the full-time plan at the major medical schools in the country. But not all the schools were won over as easily as Hopkins.

## BOSTON BRAHMINS RESIST

Harvard staunchly refused to accept the full-time plan. In 1913, while negotiating the details of the Hopkins grant with Welch, the GEB invited the Harvard medical school to apply for a grant to place their clinical departments on a full-time basis. The debt-ridden medical school sought a windfall through subterfuge. The faculty asked for \$1.5 million to reorganize all its clinical departments "on a satisfactory university basis." The clinical professors would "devote the major part of their time to school and hospital work," but they could still collect fees from their private patients whom they would see in offices provided by the teaching hospital. This proposal was hardly consistent with the GEB's by then well-known interpretation of full time.'^

The opposition to the GEB's strict full-time policy was led by two powerful members of the Harvard clinical faculty, Harvey Gushing, a renowned neurosurgeon and chief-of-surgery at Peter Bent Brigham Hospital (a Harvard teaching hospital), and Henry A. Christian, former dean of the medical school. Gushing and Christian, like other members of Harvard's clinical faculty, had lucrative private practices, which they refused to give up. They felt it was enough for the clinical faculty to devote themselves to working in the teaching hospital and "to confine their profession-

## Reforming Medical Education I 167

al activities within its walls." In return, they wanted to accept fees from "patients who might consult us during hours as we felt justified in setting aside for this purpose." Committed though he was to academic medicine, Gushing even offered his resignation to Harvard president Lowell. But, as Gushing undoubtedly knew, Lowell considered the famous surgeon more important to Harvard's academic reputation than the \$1.5 million

endowment.^^

Gates and Flexner continued to press for strict full-time commitments, turning down Harvard's proposals during several years of negotiations. In addition to their ideological commitment to full time, the GEB members had a pragmatic incentive for pushing it as quickly and widely as possible. Harvard and other schools that allowed their medical faculty to keep their consulting fees were raiding the faculties of schools that adhered to the GEB's policy. In 1921 David Edsall, dean of the Harvard medical school, tried to lure Charles Howland, the Johns Hopkins pediatrician, with the same salary he was getting at Hopkins/?/i/5 consulting fees from private practice. Flexner had to help Hopkins upgrade their facilities as an inducement to keep Howland there.^^

Harvard was able to resist the full-time plan because of its reputation as a leading scientific medical school and because its clinical faculty were too prominent in Boston's ruling social circles to be easily dismissed. Already by 1900 the Harvard medical faculty boasted that it controlled "probably more clinical material than any other one school in the country."^^ Such powerful medical figures were also physicians to the Boston upper class, and by virtue of their earnings, and many their births, they were themselves members of that very class-conscious city's upper crust. It took such Brahmins to refuse to surrender their consulting fees in the face of the GEB's compelling offer, particularly when the school's accounts were heavily in the red.

## FEAR AND TREMBLING IN THE BOARD ROOM

Meanwhile, Charles Eliot, the illustrious former president of Harvard and a trustee of the GEB, carried the battle into the GEB's board room. Eliot argued that "great improvements in

### 168 I Reforming Medical Education

medical treatment have in recent years proceeded from men who were in private practice."^^ Eliot went on to argue not merely for Harvard's latest proposal but for a complete reversal of the full-time policy and the binding contracts imposed by the GEB on universities accepting its beneficence. How could the insistence of the GEB on full time be reconciled with the board's theoretical hands-off policy, he asked rhetorically. Eliot reminded the board that it had pledged itself not to interfere with the running of a recipient institution, "except as regards its prudential financial management." Yet the board was making its strict interpretation of full-time clinical organization the condition of a grant. "This condition does not seem to me consistent with what I have always believed the wise and generally acceptable policy of the board," Eliot diplomatically concluded.^^

Eliot's arguments fell on receptive ears. The Rockefeller philanthropies were under fire from a range of groups, individuals, and newspapers spanning a considerable portion of the contemporary political spectrum. Ida Tarbell provided fuel for roasting John D. Rockefeller and his financial empire with her "History of the Standard Oil Company," published from 1902 to 1904 in McClure's Magazine. In the latter year, Theodore Roosevelt was elected President on a platform of vacuous promises to bring the trusts to heel. Encouraged by growing popular resentment against the "robber barons" and wishing to channel that resentment through stable political institutions, the Progressive movement won support from the courts as well as the Congress for small reforms and slaps on the wrists of the largest trusts. In 1907 federal Judge Kenesaw Mountain Landis struck Standard Oil of Indiana with an unprecedented \$29 million fine for receiving rebates from the Chicago and Alton Railroad. Making its way through the courts was an unprecedented anti-trust suit. On May 15, 1911, the Supreme Court ordered the Standard Oil Trust, then controlling nearly 90 percent of oil refining and sales in the United States, broken up. Neither action slew the Standard Oil empire nor diminished the fortune of John D. Rockefeller and his family. But as part of a growing public attack on Rockefeller and on unrestricted capital accumulation, these attacks were taken seriously by the Rockefellers and their industrial, financial, and philanthropic organizations.

Hoping to calm the troubled waters of popular hostility and to

### Reforming Medical Education I 169

fuel his engine of social transformation, the Standard Oil billionaire attempted to get a congressional charter for the new Rockefeller Foundation. The proposed charter sparked a veritable firestorm of protest from working-

class and Progressive leaders and newspapers. The Los Angeles Record denounced the "gigantic philanthropy by which old Rockefeller expects to squeeze himself, his son, his stall-fed collegians and their camels, laden with tainted money, through 'the eye of the needle.'" Expressing a widespread suspicion of philanthropy, the paper argued that the "monopoly-ridden masses don't want charity under any guise, but justice." The charter bill foundered in Congress for three years and in the end failed to sweep aside the articulated public anger.^^

The Rockefeller organization found a more receptive mood in Albany and was granted an unrestricted charter by the New York legislature in 1913. But even in New York, anti-Rockefeller Progressive sentiments continued to haunt both the man and his corporate philanthropies. In 1917 State Senator John Boylan introduced a bill to repeal the foundation's charter. Although this attack also failed to stop the Rockefeller philanthropy, it added flack to the assault. What most upset the Rockefeller group about this campaign were the testimony and speeches in support of the bill from Bird S. Coler, a respected Wall Street stockbroker cum-Progressive. ^o"

Meanwhile, more specific attacks were being leveled against the Rockefeller and Carnegie foundation programs. The National Education Association (NEA), meeting in St. Paul in 1914, condemned the foundations' education programs for introducing undemocratic controls into the schools. Working-class and Progressive newspapers supported the NEA resolution. The radical organs understood the capitalist class character of the foundation programs in education. The Pittsburgh, Penn., Leader considered the foundation programs so effective "that it is difficult for genuine teachers to make any headway against the class concepts that hold their heads so high in school and college."\*o^

The most thoroughgoing indictment, however, followed the "Ludlow Massacre" at the Rockefeller-controlled Colorado Fuel and Iron Company. When workers at the mining operation went on strike in 1914 for union recognition, an eight-hour day, and emancipation from the choking economic, political, and social

## 170 I Reforming Medical Education

control of the company over the Ludlow miners and their families, the company brought in armed guards. On April 20 the company's private army together with the state militia shot to death six workers and burned the tents in which the strikers' families were forced to live, cremating two women and eleven children inside them. The Ludlow Massacre shocked an already aroused public and focused anger against the Rockefellers. Labor unions, anarchists, socialists, and radicals organized demonstrations and demanded broad reforms to protect labor. Progressives joined the cry for action, and even conservative newspapers criticized the mining company.

Congress created, and President Wilson appointed, the Commission on Industrial Relations to investigate the Ludlow affair, relations between capital and labor, and the role of philanthropic foundations in general. The commission, headed by Frank Walsh, exposed much of capital's relations with the working class to examination and criticism and pointed to the important role of foundations in building a superstructure to extend capital's control throughout society. The Walsh Commission subpoenaed the senior and junior Rockefellers, Charles W. Eliot, and Jerome D. Greene to testify about the activities of the Rockefeller Foundation. The commission's final report noted that the Rockefeller and Carnegie foundations' policies are "colored, if not controlled, to conform to the policies" of the country's major corporations, which are themselves controlled by a "small number of wealthy and powerful financiers."^o^

The attacks on Standard Oil and on unrestricted capital accumulation, the hostility to foundations and the Rockefeller programs in particular, and the increased support for radical and socialist working-class movements greatly impressed the rrien of the Rockefeller philanthropies. Eugene Debs, a revolutionary socialist, rolled up nearly one million votes for President in 1912. In the Rockefeller offices and board rooms at 61 Broadway, the din outside must have sounded at times like the trumpets of Jericho.

General Education Board member George Foster Peabody, a New York banker, feared the rising tide would force the government to assume all support of educational institutions (robbing the foundations of their power and influence) and would also lead to "economic legislation which shall preclude the

acquisition of surplus wealth" (the end of capitalism itself). Peabody preached caution in the face of such challenges.'^ ^

Charles Eliot feared the outcome of class conflicts, but he believed the best defense were the programs the foundation had already undertaken:

We need not imagine that the process of accumulating great fortunes ... is going to continue through the coming generations. . . . The evils which I look forward to with dread in the coming years of the Republic are injustice inflicted on those who have by those who have not, and corruption and extravagance in the expenditure of money raised by taxation. Against such evils I know no defense except universal education including the constant inculcation of justice and goodwill. ^ o \*

Gates himself feared possible "confiscation" of wealth, but he had faith in the strength of capitalism to survive. "The recognition of the right to earn and hold surplus wealth marks the dawn of civilization," he noted to himself in 1911. ^ o ^

Gates favored standing fast on the principle of private control of wealth and opposed any special defensive strategies. When Rockefeller Foundation president George Vincent drafted the annual report for 1917, Gates suggested removing a new self-limiting policy statement. Among other points, the new policy precluded the foundation from "supporting propaganda which seek to influence public opinion about the social order and political proposals." Vincent defended the statement on the ground that "the one thing that the opponents of foundations seem most to resent is that attempt to control public opinion." ^ " ^ It was hoped that the formal statement denying the charges would be accepted by the public as a verdict of innocence.

## FEAR UNDERMINES THE FULL-TIME POLICY

Board members feared that the full-time contracts would be seen by the public as another example of private capitalist control of essentially public institutions. Visions of more public attacks and restrictive legislation undermined support for the full-time policy within the board. Anson Phelps Stokes, who succeeded Peabody on the board as the voice of caution, counseled against imposing the full-time policy through contracts. "It is not a question of whether we are right or wrong in our opinions," he

### 172 I Reforming Medical Education

explained. The full-time plan itself was not an issue. In fact, he thought it was a commendable program.

But it is a question of whether or not we can . . . afford—in view of public opinion and our great wealth as a board—to be imposing, or at least requiring, detailed conditions regarding educational policy in medicine in elaborate contracts which can only be amended with our consent. . . . Personally, I think this policy unwise and fraught with serious dangers.' ^

107

The "elaborate contracts" were a policy brought by Gates from the American Baptist Education Society to the Rockefeller business dealings and philanthropies. Applied by the GEB to their grants to medical schools, contracts with the recipient universities uniformly included a clause specifying that if the full-time plan "shall, without the consent of the said General Education board, be abandoned, substantially modified or departed from, the said university will, upon demand of said board, return said securities or any securities representing their reinvestment." ^ o \*

Stokes' fear that the contracts would become public knowledge was prophetic. While Eliot, Lowell, and the medical faculty at Harvard could be counted on to keep a gentlemanly silence about their conflict with the GEB, the more volatile president of Columbia, Nicholas Murray Butler, was not adverse to spilling the beans. Under Flexner's hard-nosed leadership, the GEB offered Columbia a substantial grant but only if the university took more decisive control of the medical school, booted out the reigning dean and clinical faculty while instituting the full-time policy, reduced the student enrollment in the medical school, and took more complete control of

Presbyterian Hospital as a teaching facility.'<sup>10</sup>^

After lengthy negotiations between Butler, Flexner, and representatives of the Presbyterian Hospital trustees, Butler rejected the proposals as "so reactionary and so antagonistic to the best interests of the public, of medical education and of Columbia University, that they will not, under any circumstances, be approved by us."<sup>11</sup>

The Presbyterian Hospital trustees, led by philanthropists Edward S. Harkness, W. Sloan, and H. W. deForest, had favored creating a new medical center and had supported all the conditions the GEB was demanding. In 1911 Harkness had given

## Reforming Medical Education I 173

Presbyterian Hospital \$1.3 million to encourage them to tighten their bonds with Columbia, giving the medical school exclusive teaching privileges in the hospital and control over Presbyterian's medical staff/" Angered at Butler's rejection of the proposals and his support for the existing practitioner faculty, the hospital trustees voted to sever all ties with the Columbia medical school."<sup>12</sup>

Negotiations continued, with Henry Pritchett and the Carnegie Foundation entering the fray in 1919. The Carnegie Foundation joined with the GEB and the Rockefeller Foundation to offer \$1 million each toward building a new medical center for Columbia and endowing its faculty. Yet the GEB held out for complete fulfillment of their policy on full time."<sup>13</sup>

Pritchett could see no reason for such obstinacy. "It is quite true," he told Flexner, "that certain of the professors are allowed to take a small consulting practice. . . . That is not 100 percent fulfillment, but I should say that it was comparable to the claims of Ivory Soap to be 99.44 percent pure."<sup>14</sup>\*

Pritchett was not only uncommitted to complete subordination of the medical faculty through a strict full-time policy. He also, and perhaps more viscerally, feared attacks on the foundations and the recipient universities. "Such a contract binding a university to a fixed policy laid down by the giver of money seems to me a dangerous thing," he complained to Wallace Buttrick, president of the GEB. "If these contracts were made public, I am sure it would bring down on all educational foundations no less than on the universities themselves severe criticism. It seems to me a dangerous policy for those who administer trust funds to adopt."<sup>15</sup>^

The standard response of the GEB officers to such criticisms of their full-time plan contracts was that "the policy was proposed to us by the trustees and medical faculty of the university and that the terms of the contract were such as they themselves asked for."<sup>16</sup>^ According to this fiction, it was Welch who proposed the full-time plan to the GEB. "We have never asked any institution to adopt the plan," Buttrick claimed. "The Hopkins proposal in all particulars came from Doctor Welch."<sup>17</sup> This self-serving posture was supported by carefully worded statements in letters, personal contacts, and even the contracts themselves. Flexner and others orally and confidentially made known the board's requirements, and they were always careful that any written

## 174 I Reforming Medical Education

proposals came from the institution. The painstaking, almost nit-picking negotiations with the Columbia medical school faculty, Columbia's president Butler, and trustees of the university belie the GEB's claims that it had "no fixed policy regarding medical education" and that they never attempted to influence the internal policies of universities.<sup>18</sup>^\*

After continued resistance by Harvard and Columbia, public disclosure of the binding contracts, public criticism by the medical profession, and a long history of attacks on corporate philanthropy, the board in 1925 altered its contracts and thus its full-time policy. Eliot had continued his attacks within the board meetings right up to the time of his resignation in 1917, charging the GEE with interfering in the internal affairs of Harvard by demanding full-time organization as the price of an endowment grant. Board member Anson Phelps Stokes carried on the fight to do away with binding contracts and the GEB's narrow definition of full time."<sup>19</sup>^

WINDOW dressing: gates defeated

Although the public clamor for abolition of foundations, or at least for their severe restriction, had abated with the demise of Progressivism, the entry of the United States in the Great War, and the repression of radical and socialist movements following the war, a majority of the GEB's trustees feared a resurgence of such attacks. "Some day the power of the 'dead hand' will again be the subject of political, if not popular, discussion," warned Thomas Debevoise, legal counsel to the board.<sup>77</sup>

Debevoise prepared the arguments to support the majority of the trustees in their fight with Flexner and Gates. First, it was important for the board not to appear to control recipient institutions. "It will hurt the reputation of the board if it attempts to direct the operation of the objects of its bounty," Debevoise argued. Second, binding contracts were unnecessary to keep the universities in line. "Most of the schools which receive money from the board come back at least a second time, and the possibility of their needing additional help should lend all the inducement necessary to make them follow the ideas of the board."<sup>78</sup>

On February 26, 1925, the board voted, with Gates adamantly dissenting, to authorize a contract with the University of Chicago that required full-time clinical faculty to receive no fees for

### Reforming Medical Education I 175

patients seen in the university's teaching hospitals but allowed them to "continue to engage in the private practice of their professions outside of the university's hospitals." The contract also allowed the university's board of trustees to make "such modifications and changes by the university in future years as educational and scientific experience may . . . justify."<sup>79</sup>

The final defeat for Gates and Flexner came later that year. At the end of September the executive committee of the GEB voted to modify the original contracts with Johns Hopkins, Vanderbilt, Washington (at St. Louis), and Yale universities to allow the boards of trustees to compromise the full-time provision (if they desired). Gates specifically asked to have his negative vote recorded.<sup>80</sup> Gates took his defeat at age seventy-two as a personal attack and a political blunder. Actually, the policy change was a minor one, a question of tactics rather than of strategy.

The full-time plan was an entering wedge, the first thrust of a continuing struggle by corporate philanthropy to control medical education and medical care—to establish the principle that society's needs, as defined by the corporate class, would prevail over the medical profession's interests. It was the first attempt on a large scale to rationalize medical care in the United States. Gates saw clearly the potential value of academic medicine—doctors subordinated to the university, the university controlled by men and women of wealth, and academic physicians researching the causes of disease and eliminating those causes at their microbiological source. All these relationships and functions would assure that academic doctors, unlike their practitioner colleagues, would serve the needs set before them and not some competing professional interest.

But in 1925 Gates was a strategist from another era. Although a loyal manager himself, he was a product of early corporate capitalism's rugged individualism, who never adapted to corporate liberalism's trust in the State and other bureaucratic organizations run by professionals and managers. He did not realize how fully academic medicine was already the instrument of foundation and capitalist interests.

Dependent on outside funding for its capital and operating expenses, medical education could be guided by whoever footed the bill. The GEB and Rockefeller Foundation efforts to insti-

### 77<sup>^</sup> / Reforming Medical Education

tutionalize full-time clinical departments had their effect, even with the resistance and the final defeat of binding contracts. Of the \$13 million in medical school operating expenses in 1926, the largest chunk—42 percent—went to salaries of full-time faculty. The Commission on Medical Education reported that in the twelve years since the GEB launched its program with Johns Hopkins, the largest single increase in budgets was "for salaries and other expenses in the clinical divisions, particularly in those schools which have placed the clinical departments on a university basis."<sup>81</sup>

Medical colleges were caught in a bind. Dependent on student fees, they had always been responsive to student demands. By the turn of the century, state licensing boards were requiring at least the rudiments of a scientific medical education. In 1907 the secretary of the Association of American Medical Colleges was able to report that students no longer sought merely the cheapest route to a medical degree. Guided by the demands of state boards, they wanted scientific medical education "and they are willing to pay for it." Every medical college that kept step with "the better schools" found "that the step taken was a profitable one in every way."

The catch was that it took more than student fees to make those changes. Although tuition fees increased to pay for the changes—in 1910, 81 percent of the medical schools charged less than \$150 per year whereas in 1925, 85 percent charged more than that in fees—they could not increase beyond the willingness of the middle class to pay them. Nevertheless, by 1927 more than one-third of the annual income of medical schools still came from tuition fees. Income from endowments was, by the mid-1920s, the second largest source of income and meant the difference, for most medical colleges, between making it as a class A school or not making it at all.^^ The influence of the General Education Board and the Rockefeller Foundation was profound.

## STATE UNIVERSITIES: PROFESSIONALS, THE STATE, AND CORPORATE LIBERALISM

Between 1919 and 1921 Rockefeller, Jr., Flexner, and Gates persuaded the elder Rockefeller to give the General Education Board \$45 million to be used for medical education. With the

### Reforming Medical Education I 177

foundation's program of building up several elite private medical schools well underway, Flexner wanted to expand the program to the lesser but still "strategic" schools of the West and the South.

In the East medical education is altogether in the hands of privately endowed institutions of learning. With the exception of some eight or ten schools, medical education in the West and South is in the hands of state universities. The board has found it practicable to cooperate with endowed institutions in developing their medical schools. It has had thus far no experience with state or municipal institutions in this field. It is evident, however, that if Mr. Rockefeller's benefaction is to be made generally effective, cooperation with state and municipal universities is necessary."

It was not long before Flexner brought a concrete proposal to the board to help the University of Iowa build a modern medical center across the river from its small and outmoded facility. The state legislature had dramatically increased its support of the medical school from less than \$70,000 in 1912-13 to more than \$1 million in 1922-23. But generous though it was to the medical school, the legislature would not appropriate the whole \$4.5 million needed to build a new medical center. Assured of continuing support by the governor and the legislature, Flexner proposed that the Rockefeller philanthropies donate \$2.5 million, with the state agreeing to raise the remainder from the taxes of the people of Iowa.^^^

When Flexner brought the proposal before the board, Gates prepared an unusually long and passionate speech. The stormy meeting was held over two days at the Rockefeller funds' favorite retreat, Gedney Farms near Whhe Plains. Gates orated for the first half day, his white hair falling in disarray over his forehead, and his necktie twisted out of place by his forceful gestures.'^^

Gates attacked the proposed grant to Iowa because: (1) it was a state university, (2) it was therefore "controlled by the taxpayers," (3) "the taxpayer is not intelligent on the needs and cost of first-class medical education," (4) no attempt was being made "to give Iowa the one supreme and simple thing Iowa needs—viz., illumination of the voter," (5) the indigenous Iowa leadership were incapable of carrying out their ideals of uplifting the medical school, and (6) the proposal was presented by Flexner, whom Gates had grown to despise as an upstart, one of

### 178 I Reforming Medical Education

the "bureaucratic officers, usurping the power of the board."^o

Flexner followed Gates and presented his arguments in favor of supporting Iowa's medical school "in the

mildest manner that I could possibly assume." He defended the plan as being practicable and necessary. "We are trying to aid in the development of a country-wide, high grade system of education in the United States. If we confine our cooperation to endowed institutions, we can practically operate only in the East." Flexner's brief, low-keyed presentation suggested the demeanor of a man assured of victory.'^^'

That afternoon and the next day board members participated in the discussion. The vote was overwhelmingly in favor of funding the Iowa proposal.

Gates never forgave Flexner's opposition. "It is amazing," he angrily wrote Flexner. "How could you! You have never squarely met one of my arguments." The issue of not contributing to state universities was a sacred one to Gates. ^^^

For Gates, the issue of the board's making gifts to state universities was bound up with his views on the relations between capital and the State and his attitude toward the people generally. Gates did not argue against the existence of state universities. "Indeed, not a few advantages must be conceded them arising out of the fact that they are tax-supported," Gates asserted. "Every taxpayer is told by his annual tax bills that the higher education is not less necessary for a democracy than the district school and the high school at his door; and that all three are equally the inheritance of his children; that the university is not a privilege reserved for religion or leisure or wealth, but belongs equally to every citizen.'""

Gifts from private wealth, however, would violate the "principle" of taxpayer support for state universities. They are "needless and gratuitous" as well; in 1923 state medical schools received fifteen times more state funds than they got in 1900, a testimonial to the "pride which legislature and people alike take in their universities" as well as to the threefold increase in the states' wealth.'^^

Worse yet, gifts by the Rockefeller philanthropies to state universities would cooperate with the state and federal governments' inheritance taxes, "designed to confiscate between them

## Reforming Medical Education I 179

the whole of very large fortunes." Since the Rockefeller philanthropies were "the only part of the Rockefeller fortune certainly safe," none of their funds should be "thrown into the swollen maw of the confiscatory states."^^^

"endow private colleges"

This attitude toward the states had been the official policy of the GEB from 1906 until the 1919 policy statement on the need to expand the medical education program to state-supported medical schools. The board was initially endowed by Rockefeller, Sr., with \$1 million in 1902. In 1905 Gates and Junior persuaded the old man to donate another \$10 million to allow the board to expand its program. Gates wrote Rockefeller's letter accompanying the gift, saying the funds were to be used "to promote a comprehensive system of higher education in the United States." As a member of the board, Gates proceeded to define what "the founder" intended in "his" letter and gift. Gates emphasized the necessity of forming a rationalized system of stable colleges and universities, "comprehensively and efficiently distributed."^^^

Gates' plan was to build up private institutions in population centers by providing them with substantial endowments. The board should "cooperate with denominational agencies," which then controlled most of the private colleges, but the colleges were not to be aided so long as they remained creatures of any church. All of the Rockefeller-funded colleges and universities, as with the Carnegie Foundation's policy, were to be strictly nonsectarian and nondenominational. In addition, Gates declared, "we must seize the centers of wealth and population." Only they can assure continuing support for universities and colleges, adequate student enrollments, and a mutually supportive relationship between the institution and the local business class. This relationship was necessary "for influence, for usefulness, and for every form of power."^^^

Finally, support by the foundation should usually take the form of contributions to the institutions' endowments rather than yearly appropriations for operating budgets. Gates and Rockefeller learned from their

experience with the University of Chicago that supporting a college's operating expenses could easily

## 180 I Reforming Medical Education

become like quicksand, consuming the whole energy and fortunes of the foundation. Moreover, Gates laid out four strategic reasons for making endowments the prime work of the GEB/^^\*

First, endowments will give universities and colleges financial stability, enabling them to attract a faculty of "great gifts and attainments" without having to pay them high salaries. High-calibre academicians are attracted "not for money but for security, for permanence and continuity of work, for freedom from distraction." The same argument, that people are drawn into academic careers for reasons of security and the undistracted pursuit of research, was applied a few years later to support the demand for full-time clinical faculty. '^'^

Second, by providing endowments to carefully selected institutions, the foundation could "preserve and mass our income ... on the strategic points in ever:increasing and cumulative power." It would not be dissipated in smaller amounts on the operating budgets of lesser programs. Third, general endowments given by the GEB would call forth other gifts and personal involvement by the local business class. ^^°

Finally, the financial stability of the colleges, the involvement of local capitalists in them, and the continued power and wealth of foundations like the GEB would keep the colleges and universities out of the hands of the people. With sufficient endowments, "no clamor of the masses can embarrass the fearless pursuit and promulgation of truth." This truth, hke the colleges themselves, was intended by Gates, as he quoted John Stuart Mill, "to rear up minds and aspirations and faculties above the herd [and] to educate the leisured classes."^"^^

The failure of state universities is their financial dependence on the legislature and the populace. "That fact becomes a powerful reason for endowing the private institutions," Gates candidly argued to the board. "If the test should ever come, the power which will act most effectively to preserve the state institutions will be private and denominational colleges and universities amply endowed and holding and teaching truth whatever may be the passions of the hour, and ultimately directing popular opinion into right channels." And, Gates prophesied, guiding the universities will be private foundations, "everywhere numerous and free." They will "so enlighten and

## Reforming Medical Education I 181

direct popular opinion at all times that there can never ensue a conflict between the democracy and its state universities."^"\*^

Thus, giving endowments to colleges in a system of higher education is like planting "apple trees" in the orchard of capitalism.

I want to see a hundred colleges in this country so planted as to cover the whole land and leave no part destitute, each of them planted in a fruitful soil, each so planted that it shall not be overshadowed by others, each conducted under such auspices as will take care of it, see that it is watered, particularly in its earlier years, see that it is properly fertilized, see that the forces of destruction which always fasten themselves on institutions shall be pruned away.^"\*^

## A NEW ROLE FOR THE STATE

During the period in which Gates' policy against giving to state universities was in force, the GEB, with Gates as chairman until 1917, often contributed to state programs. The board provided the salaries of professors of education at Southern state universities to tour their respective states to urge development of tax-supported high schools. The board paid the U.S. Department of Agriculture for the expenses of agricultural demonstration programs in the South. The campaign against the hookworm in the South and throughout the world was conducted by state and national health departments whose expenses were paid in part by Rockefeller money. '^'^^ But there were two important differences between these programs and the issue of contributing to state

university medical schools.

First, the Rockefeller organization directly controlled all these programs. The GEB named the professors of education and defined their duties. Each professor toured his state "as an officer of the university, laden with its wisdom and moral authority." The high schools that were built because of his efforts were paid for and supported by the state and local governments. Similarly, the GEB found and hired Seaman Knapp to develop the agricultural demonstration program. And, again, "the hookworm work is done in every state under the guise of the State Health Boards, while it is in fact minutely directed by Mr. Rockefeller's

staff and paid for with Mr. Rockefeller's money."""^^ Clearly, Gates and the Rockefeller philanthropies were willing to give money to the State when the State provided legitimating cover for their programs and when they were able to direct the operation.

Second, higher education differed from other programs. The bulk of Rockefeller's fortune was being used to expand the economic base of society—"employing labor, multiplying the means of subsistence, and enlarging the national wealth." But Gates recognized that other elements of civilization were equally important if the base was to survive. While Rockefeller's industries were "enlarging the national wealth," his philanthropies must stimulate "progress in government and law, in language and literature, in philosophy and science, in art and refinement." And all these "are best promoted by means of the higher education."^^^ Thus, the institutions that wrought progress in any one sphere—agriculture, public schools, health—were not so important as the institutions that promoted progress of the whole of civilization.

Because they are so widely believed to be fundamental to modern society, colleges and universities are more visible and thus more difficult for a single, national private philanthropy to control. Since the GEB and the Rockefeller Foundation could not control the institutions directly, they had to rely on people within each state. For Gates, it was tenuous enough to rely on local business classes to control private colleges. It was unthinkable to yield that control to the people, even through their legislators. It became a sacrosanct principle for Gates not to support state university programs that could not be directly controlled by the foundation.

As public and governmental attacks on Rockefeller and his philanthropies started to mount, Gates' confidence in the ability of private colleges and foundations to protect private wealth turned to bitter pessimism. "There are too many evidences for my peace of mind," he wrote Rockefeller, Sr., following Judge Landis' anti-trust decision in 1907, "that wherever the voice of the people finds absolutely free expression, that voice is not the voice of reason, of enhghtenment, and least of all of a deep-seated sense of right in pubHc things." The people's voice is merely "the voice of reckless greed to lay violent hands on other people's property."^'^^

## Reforming Medical Education I 183

Although all the political, legal, legislative, and public opinion attacks never seriously diminished Rockefeller's wealth, they struck sufficient fear into members of the capitalist class to make them somewhat circumspect in their actions. The GEB members gave up binding contracts and their strict full-time plan. But these "ominous" signs of the times made Gates all the more rigid. He strongly opposed weakening the full-time conditions, and he clung ever more fiercely to his view of the potential evils of the state universities and the importance of "throwing around them in every state a cordon of strong, free, privately endowed colleges and universities."""^\*

To Gates, then, the fight within the General Education Board over the appropriation to the state University of Iowa's medical school was a struggle over fundamental principles. Would Rockefeller's fortune be dissipated and, even worse, given over to the enemy? The board answered by overturning the policy established by Gates.

The GEB, including Rockefeller, Jr., and its newer officers were not acting on impulse or out of fear in contributing to state universities. They were impressed by the need to build a rationalized system of medical schools and realized that much of the medical education in the country would necessarily fall to state schools. Furthermore, they trusted the state universities because they understood the strength of institutional structures and the class ties of professionals as forces for "constructive" but conservative social and technological change. Raymond Fosdick, one of the new GEB members and later president of it and the Rockefeller Foundation, explained the board's defeat of Gates' policy: "Gates did not understand the progressive forces which, even as he spoke, were converting the great state universities into the social and scientific laboratories they have become.

## MODERNIZING THE GEB! GATES DEFEATED AGAIN

Soon after the board's decision to pursue and develop the Iowa grant, Flexner brought in other requests to fund

state-supported medical schools. By the middle of 1921 the board voted to aid four more taxpayer-supported medical schools—at the universities of Cincinnati, Colorado, Georgia, and Oregon—

## 184 I Reforming Medical Education

that had accepted the university arrangements that prevailed at Hopkins and the other elite private schools. '^^

After a couple of years of ad hoc decisions, Gates insisted his policy be respected or debated and voted on as policy. "Our funds, and our rules of policy," he declared to the board, "form our legacy to our successors." Exceptions "should be treated as exceptions. It is vital that these successive boards have written policies and the habit of them."^^

At the end of 1924 the board voted to appoint a committee to recommend a policy on aid to state universities. The GEB committee consisted of Gates; Rockefeller, Jr.; George Vincent, president of the Rockefeller Foundation; James Angell, president of Yale University; Trevor Arnett, a vice-president of the University of Chicago; and Wickliffe Rose, the star director of the Rockefeller Foundation's International Health Commission. The committee met at least twice and presented its report at the end of May 1925.^^

The two-page report, written by Vincent and Rose, tersely dispensed with Gates' old policy. It noted that the GEB, the Rockefeller Foundation's numerous divisions, the Laura Spelman Rockefeller Memorial Fund, and the International Education Board all had dealt with and financially aided taxpayer-supported universities and other institutions. The report politely acknowledged that in 1906 Gates' policy was "sound," but in 1925 it was clearly "unwise to adopt principles so rigid as to prevent occasional contributions to medical schools whose growth might be of importance in a national system of medical education." With Gates boycotting the meeting and Wallace Buttrick conveniently absenting himself so as not to have to vote against his friend, the board made the de jure policy coincide with the Rockefeller foundations' practice."

The reversals of the full-time contracts and the policy on state universities were too much for Gates to accept. Still fuming in October, he resigned from the GEB executive committee.'^"\*

The same revision was underway at the Carnegie Foundation, which was unable to join the GEB and the Rockefeller Foundation in aiding the University of Iowa because of opposition from old-timers among its trustees, men like Elihu Root, a corporate lawyer and former Secretary of State." The foundations and

## Reforming Medical Education I 185

individual capitalists had lost their fear of State-run institutions. Indeed, many financiers and industrialists, adherents of the new corporate liberalism, saw great possibilities for stabilizing their markets and profits in cooperation with the State. Sufficient initiative in developing legislation and executive department agencies bore fruit in the creation of regulatory agencies that enabled the most powerful sectors of several industries to control and regulate their industry themselves. Capitalists, corporate managers, and professionals in America were coming to see the State in a new light. Corporate liberalism embraced the State as the guarantor of a stable, profitable economy.^^

The state universities were no exception. In the years ahead, all the major foundations gladly developed programs at state universities as freely as they used private universities. As with physicians and medical education, the more expensive it became to operate universities, the more the universities—state and private alike—turned to any agency or organization offering money. If money was offered for developing computer sciences, there were long lines of university presidents at the foundation doors explaining how strong their mathematics, statistics, and electrical engineering departments were and how well they worked together in the campus' fledgling program in computer science. Just as with medical schools, a major foundation would fund a few key schools to develop model departments or programs. And soon thereafter other universities would be copying them or refining some problem area in a similar program, hoping to get on the bandwagon of money for research and to attract new faculty. The strategies developed in medical education were refined and applied by numerous foundations in a broad array of programs down through the years.

This willingness to use state universities and other state organizations came partly from the changed attitude of the business class toward the State, accepting the necessity and value of State intervention in the economy. But foundation officers and trustees had other reasons as well. State universities performed a valuable role by conducting foundation-designed programs at taxpayer expense. Just as the General Education Board had fostered the development of vocationally oriented secondary schools in the South, for which taxpayers picked up the major

## 186 I Reforming Medical Education

tab, its provisions for development grants in medical education and other fields committed a university to continue to support the new program once foundation funding was cut off. Gates had always supported this tactic for objectives outside the university, but to Gates the university was too essential an institution to be entrusted to "the people."

The decisive argument for including state universities in foundation programs, however, was necessity. In 1908 Andrew Carnegie dropped his opposition to including state university faculty in his foundation's retirement plan because in the Midwest and the West, state universities were the dominant institutions of higher education. The same understanding convinced John D. Rockefeller, Jr., and other members of the GEB to support state-run medical schools. If the foundations were to develop a system of higher education, it was necessary to include the predominant type of institution.

Finally, professionals as a group had demonstrated their value and loyalty to the objectives of the foundations. The foundations' own professional staffs had earned the trust and confidence of their employers—the financiers, industrialists, corporate lawyers, and university presidents who sat on the foundations' boards of trustees. Most staff officers felt trust in their fellow professionals in the field. Gates himself trusted professionals whom he hired and those who worked with his programs although at the end of his career he disagreed sharply with them. Rockefeller, Jr., voted with the board against Gates to rescind full-time binding contracts and to fund state university medical schools; he did so because he believed them important to the very goals of class domination that he shared with Gates. The foundations were not captured by their officers, as Gates asserted. Rather it was the professionals who were captured by the foundations. They did for the foundations what other members of the professional-managerial stratum had already been doing for the same people's industries and financial organizations.

Whether an economist or medical doctor teaching and doing research in a university or developing and implementing programs in foundations, professionals saw foundations supporting the development of their fields, providing for their livelihoods, promoting expanded opportunities, and rewarding excellence.

## Reforming Medical Education I 187

What could be wrong in cooperating with such foundations? Weren't they, after all, run by such esteemed men as university presidents, corporation directors, and other professionals?

These were the very relationships and attitudes encouraged by Gates and other self-conscious strategists who built the foundations and gave them purpose and direction. Like the medical schools in Gates' and Flexner's funding strategy, the leading foundations won the flattery of imitation by their weaker brothers and sisters. Gates was indeed the pillar of the General Education Board and the Rockefeller Foundation until his semi-retirement in 1917. Although his successors modified some of his policies and tactics. Gates' goals and strategies seemed inscribed in stone.

Corporate philanthropies continued to find their mission in making capitalist society work better. Sometimes they tried to make it work more justly, but even then it was because gross injustice leads to movements for radical change. Generally, they have followed the corporate liberal view developed in the Progressive era and later joined by Rockefeller, Jr. His son David, head of the Chase Manhattan Bank, recently summed up this perspective, still popular in business and dominant in foundations:

In view of the emerging demands for revision of the social contract, a passive response on the part of the

business community could be dangerous. ... So it is up to businessmen to make common cause with other reformers—whether in government or on the campus or wherever—to prevent the unwise adoption of extreme and emotional remedies, but on the contrary to initiate necessary reforms that will make it possible for business to continue to function in a new cHmate. . . . ' ^ " ^

If the foundations lost their fear of the State, it was not because they had turned aside the objectives or general strategies of people like Gates. They pursued the same goal of rationalizing higher education in general and medical education in particular to make them better serve capitalist society, and hke the dominant view within the Rockefeller boards (but unlike Gates' personal view), they adopted corporate liberalism's perspective that the State is a necessary aid in rationalizing industries, markets, and social and educational institutions alike.

## 188 I Reforming Medical Education

### SUMMING UP

The reform of medical education led to a contest over who would control medicine and for what ends. At the end of the nineteenth century laboratory scientists and elite practitioners formed an alliance to promote scientific medicine, revamp the AM A, win hcensing legislation, and begin reforming medical education. Abraham Flexner's report for the Carnegie Foundation capped the drive to eliminate proprietary medical schools, the pariahs of all proponents of scientific medicine. Proprietary schools, sensitive to the needs of the average general practitioner, had served the needs of most students going into family practice while their faculty enhanced their incomes with student fees and consultations referred by former students. These commercial schools, however, churned out "too many" doctors, resisted control by medical societies, and were completely inadequate to providing the scientific, research-oriented medical education that was desired by the profession's reform leaders and by capitalist philanthropies.

Focusing on "commercial" medical schools and their low standards, the Flexner report articulated criticisms of American medical education and a program for reform that unified elite practitioners, medical scientists, and philanthropists. With the rapid decline of proprietary schools in the 1910s, however, the basis of unity evaporated, and more fundamental conflicts emerged.

The organized medical profession, in particular the AM A, which represented practitioners, wanted to control entry into the profession, assure that the training of physicians upheld the newly established confidence of the public in doctors' technical ability, and ensure that medical schools provided material support and propaganda to continue the dominance of scientific, technological medicine.

The new academic medical men, especially laboratory scientists, saw the medical centers as their turf. They wanted a greater share of the money spent on medical care, and they wanted, through their medical centers, to control all health care services and facilities. It made sense, they argued, for those who were the source of medical science to direct the resources of the new scientific medical system.

## Reforming Medical Education I 189

Foundations, claiming objectivity from their position above interest group squabbles, wanted to rationalize medical care, to create an efficient and unified system that would contribute to the health of the people. To that end, the General Education Board and the Rockefeller Foundation together gave more than \$100 million to transform medical education. Like the committed academicians, they believed medical schools were the pivot of an increasingly technological system of medicine.

The Carnegie Foundation stepped onto center stage before the conflicts between medical scientists and elite practitioners reemerged. Their support for the Council on Medical Education encouraged reform-minded practitioners and science-oriented academics vying for control Flexner's report supported practitioners' insistence on closing down medical colleges and raising the social class base of the profession, and academicians got support for channeling endowment and construction money into medical schools. The capitalist class was encouraged that a medical care system useful to and compatible with its interests was at last at hand. The Carnegie Foundation, under Henry Pritchett's personal guidance, lent its prestige and legitimacy to the

profession's own strategy.

The General Education Board and the Rockefeller Foundation, under Frederick T. Gates' direction, jumped in with a different strategy. Rather than supporting the scheme of the profession's leadership, which sought unity among academics and practitioners, the Rockefeller philanthropies supported the dominance of the medical scientists. Practitioners espoused capitalist values in wanting to make a profit from their professional services qua small business. But Gates and other foundation leaders had in mind a more important political and economic role for medicine, a role that required that health care be organized along the most efficient and productive lines possible under leadership that had demonstrated its support for the interests of the greater capitalist society. Just as the AMA Journal had warned at the turn of the century, there were dangers in letting wealthy capitalists formulate their own philanthropic designs.<sup>^^</sup> The GEB's full-time plan attacked the interests of clinicians and the organized profession's ties to the medical faculty.

The differences in the Carnegie and Rockefeller strategies can be traced to Pritchett and Gates. Pritchett, before organizing the

## 190 I Reforming Medical Education

foundation for Andrew Carnegie, had been president of MIT and before that an astronomer for the U.S. Coast and Geodesic Survey. He was a scientist and a professional, and he was concerned about developing and maintaining a sufficient supply of engineers and trained personnel for industrial and government needs. Gates was a former minister and, since the 1890s, a director of industry and finance. Gates' ministerial background probably contributed to his perception of the role of social institutions as an important superstructure for society. His daily experience with business affairs from his perch at the top of the capitalist class gave him a broad perspective on the needs of capital.

Though these two men were significant in shaping their foundations' policies, the differences between them were not personality differences. They differed on political questions— what will best serve the needs of capitalist society?—and their personal histories are merely sources for understanding how their differing political perspectives developed. Both men and both foundations supported rationalizing medical care. Gates foresaw the problems with the medical profession that Pritchett only later appreciated. Pritchett supported the profession's own plan of action for several years before he became piqued at the narrow concerns of the AMA and Bevan in particular.

Bevan and other clinicians leading the AMA resented the General Education Board's attack on clinicians' interests. The Rockefeller philanthropies had become "a disturbing influence by dictating the scheme of organization of our medical schools," Bevan wrote to Pritchett. "Their position has become a real menace to sound development." The GEB had been "badly advised by men who are laboratory workers and teachers of anatomy and pathology," he complained. These men regarded "the laboratory as representing the science of medicine, and they rather feel that clinical medicine is not scientific." Bevan argued that in the training of physicians "the controlling influence must lie with the teachers of clinical medicine."<sup>^^</sup> But Pritchett had seen the results of leaving medical education to the practitioners' singular concern for their own interests and their disregard of the larger goal of rationalizing education in the society.

By 1920 the elite practitioners broke off their alliance with the medical academicians and other supporters of rationalized medi-

## Reforming Medical Education I 191

cal care. A plan for compulsory sickness insurance sponsored by the American Association for Labor Legislation—a corporate liberal organization of social reformers, enlightened capitalists, and a few labor leaders—had won the support of a few key men in the AMA beginning in 1915. From the perspective of the time, the efforts to rationalize medicine seemed to physicians and foundation people alike to be leading to the demise of the private practitioner. In 1915 Welch rather condescendingly urged that "every effort ought to be made to rescue this situation," to preserve the "fine" institution of the family doctor.<sup>^^</sup> The dour prognosis for private practice

medicine was definitely premature.

As local medical society leaders caught on to "the professional philanthropists" and their attempts to "put something over on us to our detriment," the Progressives within the AMA were denounced. The academics, like Welch who had been elected AMA president in 1909, were by then isolated. By 1920 at least 60 percent of the country's doctors were members of the AMA. '^ With so many physicians joining up to support practitioners' interests, with the academics out of leadership and the Progressives, like Alexander Lambert, in retreat, the conservative leadership of the practitioners prevailed, a reign uninterrupted to this day. '^

By the time Gates resigned from the General Education Board's executive committee in 1925, the efforts to rationalize medical care had not gotten as far as Gates had hoped. The constraints on his program notwithstanding, Gates' position became the established foundation direction in medicine for half a century.

## CHAPTER

### Epilogue: A Half-Century of Medicine in Corporate Capitalist Society

A VIRTUAL revolution transformed American medicine from 1890 to 1925. The medical profession ascended from ignominy and frustrated ambition to prestige, power, and considerable wealth. Medical science was developed from a mere gleam in the profession's eye to an established and powerful force in society.

This American success story is attributable to several historical developments. First, industrial capitalism created a new role for science and its application. Science was elevated from a gentlemen's avocation to a vital element in the competition for increased productivity and decreased labor costs. Scientists seized the opportunity to be of service to the masters of this new economy, and they were in turn rewarded with money and facilities for their work and prestige for their achievements and themselves.

As the organization of production grew larger and as the financial and legal underpinnings of capital grew more complex, capitalists recognized the need for managers and professionals to run their factories, their banks, and the social institutions that serviced the society and held it together. Universities became the main vehicles for training this new stratum of managers, professionals, and scientists and for organizing scientific research.

Second, physicians who were dissatisfied with the state of their profession recognized the economic and political, as well as

### Epilogue I 193

technical, advantages of applying science to their rather crude art. By embracing scientific medicine, leading practitioners bolstered their crusade for a monopoly over the practice of medicine. The forefathers of academic medicine chose "glory" over "gold" and advanced the cause of medical science. Working together, elite doctors and medical researchers adopted the analytic methods and rubrics of science and lodged the training of physicians in the university. They sought designation as the society's legitimate professionals in matters of health and illness. With this strategy, they won the political and financial support of the new corporate class.

Third, mobilizing the power of corporate wealth in the social sphere, foundations brought unprecedented aid to the promotion of scientific medicine and to the reform of medical education. As the guiding force for the reform and development of institutions to serve the scientific, educational, and cultural needs of capitalist society, foundations played the leading role in financing necessary changes in medicine. By providing the carrot of subsidy to capital-hungry medical schools, foundations secured a position of enormous power in medicine from 1910 to the 1930s. In this period, foundations gave some \$300 million for medical education and research. Rosemary Stevens concluded, "Foundations were thus the most vital outside force in effecting changes in medical education after 1910." ^

## THE ROCKEFELLER PHILANTHROPIES

Of all the foundations, the General Education Board was, in the boastful but true words of Abraham Flexner, "the leading influence in remodeling American medical schools on the Hopkins plan."^ The more than \$82 million they applied to medical education reform by 1930 had an enormous impact because they employed a carefully conceived and faithfully followed strategy in which they consciously analyzed the interests and goals they wished to further, mapped out a plan for achieving them, and imposed necessary financial and programmatic conditions on recipient schools. The GEB sought a rationalized medical care system, directed by medical schools that were committed to a scientific and technological type of medicine.

### 194 I Epilogue

Frederick T. Gates and the General Education Board did not achieve everything they sought, but even by 1929, the year Gates died, they had firmly established three important strategies in the development of medicine in the United States. First, Gates and the GEB created an important role for foundations—to give direction to the development of American health care. They assumed the right to define what kind of health care their society needed, and they used their tremendous corporate wealth to realize that vision. In its early years, the GEB provided a leadership that was widely followed by other foundations and by wealthy individuals. Gates and his associates achieved power over American medicine partly because of the wealth they wielded but, more fundamentally, because they articulated the interests of the corporate class in a strategy that won sufficient support to succeed.

Second, as part of their strategy. Gates and the Rockefeller philanthropies promoted the dominance of scientific, technological medicine. Because of the ideological appeal of this new medicine and its presumed technical effectiveness, the philanthropies and many other groups in industrialized capitalist societies embraced the analytic theories and the research and development methodologies of medical science and advocated the organization of medical practice solely around technological medicine. By 1930 they had firmly established the importance of well-equipped medical centers for all medical practice and health care organizations as well as for training new medical professionals and for developing knowledge and technique.

Finally, Gates and his followers in and out of the GEB began the long struggle to rationalize medical care, that is, to coordinate and integrate the different elements of the system so that it performs its designated functions. One of the main obstacles in that struggle has been private practice physicians, whose desire to profit from other people's sickness and suffering evoked angry opposition and accusations of "commercialism" from Gates and his colleagues. Because the interests of the organized medical profession conflicted with the goals of disseminating the technical benefits and ideological influences of medicine as widely as possible, the Rockefeller philanthropies attacked the profession head-on. Although they did not succeed in vanquishing the medical profession, they did initiate the strategy that was continued and refined by foundations for decades to come.

### Epilogue I 195

The forces set in motion during Gates' time continued to develop over the next half-century, as the remainder of this chapter will make clear. Although foundations continued to provide leadership in medical affairs, the State soon took over from the foundations the dominant financial role in the reform and development of medical care. The State continued foundation-developed strategies of rationalizing medical care and developing technological medicine. This chapter will focus on two important developments that created conditions Gates and his contemporaries did not anticipate.

First, technological medicine created opportunities for the development of new medical industries that came to play powerful roles in medical politics as well as in the medical economy. Rationalization was simply applied to this private market sector, facilitating the expansion and control of capital-intensive medical industries but failing to correct the deficiencies inherent in market-distributed medicine.

Second, the State's continued emphasis on medical technology served the corporate class interest in its own legitimation and the interests of medical technology interest groups. But the explosively inflationary effects of medical technology in a market system eventually undermined support for its expansion and encouraged the partial substitution of other legitimizing ideologies. As we will also see, neither of these developments has produced a medical care system that meets the widely recognized needs of the population.

## RATIONALIZING THE MEDICAL MARKET

### THE COMMITTEE ON

### THE COSTS OF MEDICAL CARE

One of the milestones in foundation-led efforts to rationalize health care was the Committee on the Costs of Medical Care (CCMC). The committee was formed in 1927 and was provided with a million-dollar research and expense fund by eight foundations, including the Rockefeller, Rosenwald, Macy, Milbank, and Carnegie philanthropies. Over the next four years the CCMC's staff and consultants turned out twenty-six reports, and in 1932, the committee concluded with a final report that at the time seemed sweeping.<sup>^</sup>

### 196 I Epilogue

The report documented the great disparity in medical care according to income. Middle- and upper-income families averaged substantially more physician visits per person each year than lower-income families. Hospitalization, dental care, preventive care, and eye care were likewise strongly related to family income. The committee's critical analysis implied an important principle: The sale of medical care as a commodity distributes that care to those who can pay for it rather than on the basis of need. That is, it is distributed according to the society's class structure.

The committee recommended reorganizing medical care into group practices and developing more hospitals rationally distributed where needed, voluntary insurance plans to spread the uneven financial risks of illness among the population, and coordination of health care by the government. The thrust of these recommendations was to reduce the runaway power of the medical profession over health care by weakening the fee-for-service system of private practitioners, strengthening the position of hospitals in the organization of health services, and organizing the callous market for medical services into a rationalized, regulated system."<sup>^</sup>

The report articulated and legitimized the perspective and goals of the medical care reform campaign, much as the Flexner report had done for the medical profession's campaign for medical education reform some twenty years before. The recommendations were supported by virtually all of the committee's thirty-eight public health officials, business leaders, foundation officers, medical school faculty members, social scientists, labor union officers, and government officials. Through the CCMC, they formed a loose coalition whose leaders included some foundation officers and staff members who had worked for or with Gates and the Rockefeller philanthropies. Over the years this coalition, soon joined by hospital administrators and some health insurance industry officers, led efforts to rationalize medical care.

Nine representatives of organized medicine on the committee dissented from the majority report, attacking the group practice and prepaid insurance proposals and supporting voluntary insurance only if it protected fee-for-service practice under local medical society control. Although the committee majority advo-

### Epilogue I 197

cated a continuation of privately controlled medical care, their proposals for more publicly organized financing and increased coordination of care were taken as a declaration of war by private practitioners. The *AM A Journal* rose to the occasion with a classic in hyperbole:

The alinement is clear—on the one side the forces representing the great foundations, public health officialdom, social theory—even socialism and communism—inciting to revolution; on the other side, the organized medical profession of this country urging an orderly evolution guided by controlled experimentation which will observe

the principles that have been found through the centuries to be necessary to the sound practice of medicine.'

Efforts of this "revolutionary" coalition in the 1930s to develop some form of national health insurance met defeat at the hands of the AMA's well-funded lobbying machine. "The controversy between 'organized medicine' and many major interests in our society became intensified," I. S. Falk, research director for the CCMC, recently observed, "and a dichotomy of national proportions began to take shape." ^ The AMA, as an interest group, declared civil war against the corporate class-supported efforts to rationalize medical care. A long succession of national health insurance bills was submitted to Congress by the reform coalition, but they were defeated by the AMA wielding the medical profession's wealth and the resulting power to influence public opinion and legislators' votes.

## DOCTORS AND THE CAPITAL-INTENSIVE COMMODITY SECTOR

In the long run, however, the medical profession's autonomy was undermined by the same economic forces that contributed to their seemingly irrepressible rise in power, wealth, and status. Just as outside capital was needed to finance the development of medical science and the reform of medical education, technological medical care requires a financial base that cannot depend on the fees paid by individual patients. The dependence of physicians on technological medicine and the requirements of technological medicine for large capital and operating expenditures eventually weakened the political autonomy of the profession.

Hospitals, for example, provided doctors with new diagnostic

### 198 I Epilogue

and treatment facilities that made physician care technically more sophisticated and enhanced the prestige of doctors' roles. But hospitals required increasing funds and a stable system of finance. Since physicians could not themselves provide the capital to build and equip hospitals, the hospitals had to depend on philanthropy, government, and commercial banks for their needed capital. As the demands for operational funds increased, hospitals had to look beyond the billing of individual patients to the resources of insurance companies and the government. Similarly, physicians depended on medical schools to produce advances that might be applied to medical practice, to train new members of the profession in science-based medical theories and techniques, and to socialize new members in norms that made the profession cohesive and powerful. They also depended on drug companies to produce their materia medica—the essential base of their practice since prescription drugs gave doctors new power by making the public see a physician in order to be allowed to obtain the fruits of medical research. Prescription drugs, hospital care, medical equipment and supplies, and health insurance all quickly became essential commodities of the medical kingdom over which physicians reigned.

Private practice medicine had been founded upon simple, or petty, commodities that the physician himself could produce and sell. But technological medicine made physicians dependent on capital-intensive commodities, ones that require substantial capital investments and a good deal of hired labor to produce." For decades, this development redounded to the advantage of the profession. Medical technology enabled the profession and these new interest groups to further divide medical care into discrete service units and products that could be sold in the medical market. This intensive "commodification" of medical care enlarged the number of medical commodities that could be marketed. Physicians assumed a new role in this market as middlemen as well as more "productive" producers. They were able to control more and more of the increasingly lucrative medical market, claiming a monopoly of expertise and authority over health care and over the increasing numbers of health workers. But the profession's growing dependence on capital-intensive medicine contained the seeds of their political decline—the loss of their ability to protect the economic relations on which private practice

### Epilogue I 199

was founded. This contradiction was focused especially in the hospital.

Hospitals, as the Committee on the Costs of Medical Care demonstrated, were inadequate in number and not rationally distributed according to need. In the 1930s, the Julius Rosenwald Fund gave the American Hospital Association (AHA) \$100,000 and the loan of staff member Dr. C. Rufus Rorem (who had been a senior

researcher for the CCMC) to help the AHA rationalize hospital administration and organize Blue Cross associations.\* The foundation and the AHA hoped the hospital insurance program would provide a stable income for hospitals hard hit by the depression, centralize and integrate local health services around hospitals, and further the cause of voluntary health insurance at least for hospital expenses.

Blue Cross plans were a phenomenal success and proved the value of "third-party" payment mechanisms. The risk of medical misfortune was spread among many individuals and families, enabling them to have access to more expensive kinds of care. The demands of labor unions for greater economic security and more benefits encouraged the spread of work-related group plans. By 1947, after several years of cost-plus government war contracts. Blue Cross enrollment reached 27 million members, 19 percent of the population. After the war commercial insurance companies, following the Blue Cross lead, pushed energetically into the health insurance market they had previously all but ignored. Blue Cross and commercial health insurance companies developed this new commodity into a major industry—totaling \$39 billion in premium income in 1977-and strengthened hospitals' finances and their position in the medical delivery system.'

The groups that had coalesced around the Committee on the Costs of Medical Care pressed on with their campaign to reform medical care. Since these interest groups favored coordinating care under the leadership of medical schools with hospitals as the "logical center" of the system, hospitals became ardent advocates of reform and rationalization that expanded their roles and power. With the support of the AM A, the loose coalition won passage in 1946 of the Hospital Survey and Construction Act, better known as the Hill-Burton Act.^° The Hill-Burton Act was another milestone, not merely because of the \$5 billion it has since provided for hospital construction and modernization, but

## 200 I Epilogue

because it marked the entrance of the State as a principal power in the medical care system.

## THE STATE: RATIONALIZING THE PRIVATE MARKET

After World War II, the State became the conduit for more funds to expand and rationalize health care, taking over from foundations the primary role of financing reforms in medical education and later providing the operating funds for medical schools and medical care itself. The State's intervention would not, of course, be neutral. The State's interests are larger than those of any interest group, whether in health or in the larger economy, but the State is only relatively autonomous. In developed capitalist countries, it shares a mutual dependence on and an interdependence with the dominant economic class. Top government officials come disproportionately from the corporate class. The government's tax revenues depend on the "health" of the capitalist economy. And the government promotes and protects the larger interests of the corporate class, particularly its dominant sectors. Though it might be to the disadvantage of any one company at a particular point in time, in the long run, government regulation benefits the dominant firms in an industry by permitting monopolistic concentrations of economic power but preventing those concentrations from turning into devastating wars of economic conquest. The State facilitates the process of capital accumulation and legitimizes the existing capitalist society. The explicit reliance of the corporate class on the State was articulated by corporate liberals in the Progressive era. Although the State's intervention in organizing production and social relations was initiated during that period, it matured rapidly during the Great Depression and became the ruling order during and following World War II. The State became as important to medicine as it is to the larger economy."

While the commitment of the State to rationalizing medical care was clear, it was not clear whether it would rationalize it under existing private ownership and control or whether it would rationalize it under government ownership and control, as many Western European nations were doing. The consequences would be important.

Rationalizing health services under private ownership and

## Epilogue I 201

control would accelerate the transformation from simple commodity production to capital-intensive commodity

production while nationalization would begin to transform health services from commodities into a public service function. The direction was not decided as a matter of policy. It was shaped and constrained by economic and political developments in medical care and the larger society—in part by the AMA's opposition to national health insurance and the lack of a sufficiently strong and threatening working-class movement, in part by the growth of the powerful capitalist commodity sector in medical care, and in part by the role of the State in advanced capitalist countries.

In Europe national health insurance programs were established either by fairly conservative governments in response to militant working-class revolt that threatened to overturn State power and capitalism itself or by labor or social democratic parties that won sufficient electoral victories. In 1883 Bismarck established the Sickness Insurance Act to help stem the growing support for socialism among the German working class. In England Lloyd George and the Liberal party enacted the National Health Insurance Act in 1911 to win the workingmen's swing vote away from the socialistic Labor party. When the Labor party finally came to power after the Second World War, it nationalized the hospitals and the insurance system in the National Health Service Act.

In the United States the closest the working class came to threatening ruling powers was during the Progressive era when the Socialist party won significant election victories and its militant wing was gaining support for more revolutionary activity. In 1916 the American Association for Labor Legislation (AALL), an alliance of Progressive businessmen and reformers and nonsocialist labor leaders, introduced its model compulsory medical insurance bill into several state legislatures. Although some Progressive AM A officials supported the bill, the proposal was crushed by private practitioners who organized within and outside the AMA to defeat this "attack" and by the conservatism and political repression that swept the country following America's entry into the war.

In the absence of a sufficiently independent and militant working-class movement, national health insurance continued to be defeated in the decades that followed. Throughout the 1930s

## 202 I Epilogue

and 1940s the AMA carried on its vehement opposition to any federal intervention into the financing of medical care. Liberal reformers tried to get national health insurance included in the Social Security Act as part of the New Deal response to the Great Depression and the militant organizing among the unemployed and industrial workers. But the AMA was powerful enough to strike any mention of health care from the Social Security bill. In the 1940s the AMA waged well-funded, energetic, and successful campaigns against the Wagner-Murray-Dingell and Truman proposals for a nationalized health insurance system. The association even came around to supporting voluntary private health insurance as "the American way" to undercut the growing support for a government-run national health insurance program. Finally accepting defeat, liberal proponents of medical care reform retreated to advocating proposals for government health insurance restricted to the beneficiaries of Social Security programs.

The depression and the Second World War firmly established the principle of federal economic intervention to organize and stimulate production and necessary social institutions and services. The Hill-Burton Act was an example of that principle extended to medical care. But the AMA continued its decades-old opposition to increasing the number of medical students and defeated proposals for direct aid to medical schools. Nevertheless, a back door was opened with medical research funds—which the AMA welcomed as furthering the development of medical technology—to help pay some of the overhead and salaries at medical schools. In the 1950s construction grants and traineeships for medical schools were finally approved by Congress because of the intensifying public concern about a growing doctor shortage. The AMA was learning the limits of its political power."

In the mid-1960s the advocates of rationalization won a major legislative and programmatic victory over the AMA with the passage of the Medicare and Medicaid bills, fallback programs from earlier efforts to obtain comprehensive national health insurance. Medicare is a Social Security program that covers most hospital, physician, and related medical services for more than 95 percent of all Americans over sixty-five years of age. Medicaid, a welfare-linked federal and state program, helps pay the health care costs of people on welfare and

other "medically indigent"

## Epilogue I 203

persons. Bitterly and expensively fought by the medical societies, the passage of Medicare and Medicaid signaled the further decline of the medical profession's power and the growing dominance of forces committed to rationalizing medical care.

Like private health insurance, these State subsidies and "third-party" programs were parts of larger strategies to rationalize health services. Since attempts to nationalize even health insurance appeared blocked, proponents of rationalization seemed content with rationalizing the private medical market.

## THE GROWTH OF CAPITAL-INTENSIVE COMMODITIES

While private health insurance provided a stable cash flow on which hospitals could depend and expand, Medicare and Medicaid seemed a Umitless largess. They fed the market competition between hospitals and the avariciousness of hospital administrators, construction companies, banks, the medical supply industry and others who could get their hands into the public till. Following the introduction of Medicare and Medicaid, hospital and physician fees rose each year at twice their previous rates of increase, and the cost of medical care in general rose twice as fast as inflation in the rest of the economy. Capital investment per hospital bed rose three times as fast in the five years after Medicare and Medicaid began as it did in the five years before, reaching \$56,000 per bed in 1976. Medicare and Medicaid picked up an even bigger share of the medical care bill—\$37 billion in 1977, a fourth of all personal health care expenditures from all sources. ^^

Medicare and Medicaid, together with private health insurance, effectively subsidized the rapid expansion of capital-intensive medical care. Hospitals felt assured that everything from automated blood-chemistry analysis machines (costing upwards of \$100,000) to computerized axial tomography (CAT) scanners (costing \$300,000 to \$750,000) could be paid for. Expansion has resulted in as many as 100,000 excess hospital beds in the country, averaging about \$20,000 per bed in annual operating costs. ^^ Banks were among those who profited from this expansion by providing hospitals with profitable commercial loans, usually guaranteed by the government.^" CHnical laborato-

## 204 I Epilogue

ries, hospital and medical supply, drug, and nursing home industries similarly boomed.

An increasing share of the medical commodities being produced were capital-intensive ones compared with physician services. The "average" person spent seven to eight times more on physician and dentist services in 1977 than in 1950, but he or she spent twelve times more on hospital care and forty-nine times more on nursing home care.^\* With the expansion of private health insurance and especially with the passage of Medicare and Medicaid, the power of physicians shrank relative to the increasing economic and political power of the capital-intensive medical sector. This sector has now surpassed the medical profession as the dominant political force in medical care, mainly because of the shared interests of three important groups.

## THE "CORPORATE RATIONALIZERS"

Medicaid and Medicare are the offspring of the groups that articulated the majority position of the Committee on the Costs of Medical Care, helped the American Hospital Association develop and coordinate the role of the hospital as the "logical center" of the health care system, and secured passage of the Hill-Burton and other federal aid programs. They are what Robert Alford calls the "corporate rationalizers,"^^ favoring the coordination and organizational integration of the different parts of the medical care system, or as they refer to it, the "non-system."

In reality, there are three distinct groups that favor rationalization—two interest groups and a class. One interest group is composed of bureaucratic professionals—academic physicians and public health officialdom, advisers, planners, and consultants. They are the functionaries of bureaucratically organized medical care who staff the

increasing layers of government units, medical schools, and health agencies and organizations of all types. Although the bureaucratic professionals generally maintain that the major goals of medical reform are equal access for the poor and racial minorities and more accessible primary care for everyone, they have a material interest in such reforms because they gain power and status with each new level of rationalization. They are the technicians and managers on whom

## Epilogue I 205

foundations and government rely for planning and conducting the reforms that are proposed and implemented. Bureaucratic professionals are the least powerful of the three groups because their positions are dependent on those whom they serve.

The second interest group among the rationalizers are those industries with a direct economic stake in the medical market—the market rationalizers. The two most active industries in this group are hospitals and health insurance carriers. In 1976, voluntary hospitals, as privately owned nonprofit hospitals are called, claimed 70 percent of the beds, 72 percent of the average daily patient census, and 76 percent of the assets of nonfederal short-term hospitals.<sup>10</sup> And they took the lion's share of the more than \$65 billion spent on hospital care in 1977, making them a major economic force in the health sector. While their existence does not depend on the medical commodity marketplace—that is, they would exist even in a nationalized health system—their autonomous power is greatly enhanced by this privately controlled market system. Like any corporation, hospitals have entrepreneurial power to capture what they can of the market,<sup>11</sup> accumulate a surplus of revenues above expenses, and allocate resources within the constraints of the market.

Similarly, Blue Cross and Blue Shield, though "not for profit," aggressively marketed about \$19 billion of their insurance products in the medical market in 1977. Like the "Blues," profit-making insurance companies, which collected about \$20 billion in health insurance premiums in that year, depend for their existence on the market system for medical care. The traditionally close ties of Blue Cross and Blue Shield to hospitals and medical societies, respectively, have weakened in recent years because of public pressure over rapid rate increases which brought stronger regulation and formal separation from their parent bodies. The Blues and commercial carriers now share increasingly similar interests in holding down medical costs to what the premium market will bear. Together with drug companies, banks, and other profit-making concerns, hospitals and insurance companies have a direct stake in the ascendance of an expanding commodity system in medical care, especially with the enormous State subsidies represented by Medicare and Medicaid or a national health insurance program. Their interest in rationalization is limited to expanding the market for their wares and

## 206 I Epilogue

protecting their respective places in the increasingly rationalized system they see as inevitable.

The third group of rationalizers is the corporate class, including those who own or manage the nation's corporate wealth and foundation trustees and officers who supervise the expenditure of that portion of the wealth that is devoted to managing social institutions. The contemporary corporate class includes the main shareholders and the top officers in the largest corporations. It certainly includes the one-half of one (0.5) percent of the nation's population who own one-fifth of all the nation's wealth, including half the net worth of all bonds and corporate stock.<sup>12</sup> Economic power is similarly concentrated among corporations, a minute fraction of which (0.06 percent, or 958 corporations) held a majority (53.2 percent) of all corporate assets in 1967. Similar concentrations are found in the separate economic sectors— manufacturing, banking, and insurance among them.<sup>13</sup>

Power is concentrated among foundations, too. Of the 2,818 foundations in the United States in 1976, the top eight (representing three-tenths of one percent of all foundations) held an average of \$948 million in assets while three-fourths held less than \$5 million each, and another fifth had assets of \$5 million to \$25 million.<sup>14</sup> The top eight—including such important ones in the health field as the Robert Wood Johnson, Rockefeller, Kresge, and Kellogg foundations—have an enormously disproportionate impact on educational, scientific, and cultural institutions. Although the members of this class do not think alike by any means, they share a common

interest in maintaining the capitalist economic system and their collective positions of power and wealth in it."

As my analysis of the involvement of earlier capitalists in medicine demonstrates, the corporate class has a compeUing, but narrow interest, in the health of the people and the kind of medical care provided for them. But that interest extends only to assuring that the population maintains sufficient physical and mental health to provide an adequate work force and that medical care encourages dependence on technical and professional management of individual problems. Capitalists may be concerned about accessibility, as Gates was, because an inaccessible system cannot perform its designated functions. They may even favor the complete nationalization of medical care, as

## Epilogue I 207

Vicente Navarro points out,^^ to raise productivity or placate threatening movements and bolster the failing legitimacy of the system.

However, corporate owners and managers and foundation trustees and officers are ideologically reluctant to view private ownership and control as inherently problematic in providing for social needs. Members of the class who are associated with corporations obviously profit directly from the private control of capital accumulation while the influence of foundation members derives from their foundations' investments in corporate wealth. They thus share a material interest in ignoring any conflict between private control of resources and the stated goals of rationalizing medical care.

Bureaucratic professionals, medical industries, and the corporate class coalesced around their common interests—expanding capital-intensive medical care and bureaucratic organization as the main features of rationalization, being careful not to trample on private ownership and control. Faced with this corporate model of rationalization, how did the State respond?

## THE STATE AND CAPITALIST MEDICINE

The State intervened with subsidy, incentive, and regulatory programs to readjust the market system, decrease the market economy's inequitable distribution of medical commodities, and restrain the unusually inflationary forces of the medical marketplace. Although it has provided "categorical" programs for those who could not afford essential medical services, the State has not tried to replace the commodity market with an equitably distributed pubHc service. Because the power of the medical profession, in the absence of sufficient countervaiHng pressure, blocked efforts to nationalize the financing and delivery of medical care in this country, the privately owned and privately controlled system was simply expanded through direct subsidies and incentives. Expansion and subsidy favored the development of a capital-intensive commodity medical sector both because it was the economically dominant portion of the medical market and because it was consistent with the ideological perspectives and material interests of the corporate class.

Those corporation and foundation members who have no

## 208 I Epilogue

investment in profit-making medical industries see the health care system as a support industry for the primary and secondary sectors of the economy. But by the 1950s the powerful finance sector of the economy, represented by insurance companies and banks, had developed a large stake in the subsidized medical market. Few members of the corporate class, even those without profit-making medical investments, railed against "commercialism" in medicine, as Rockefeller philanthropy officers had done in their drive against private practitioners early in the century. Even most bureaucratic professionals, who do not themselves have a financial stake in profit-making medical care, preferred to ignore the issue.^"^^

The more the State intervened financially in the medical care system, the more likely it became that it would have to intervene politically to control the system in which it had developed a principal financial interest. Employers worried about the growing cost of health plan benefits they were paying. In 1976 General Motors spent more on Blue Cross and Blue Shield plans, about one billion dollars, than it did on purchases from U.S.

Steel. Steel companies, banks, airlines, and most industries were unhappy about the 10 to 25 percent a year increase in the cost of employee health insurance benefits.<sup>^^</sup> And unions were concerned because every increase in health insurance rates (paid for through fringe benefits) cuts into potential pay raises for their members. Other health services "consumer" groups also criticized the shrinking proportion of physicians and services devoted to primary care and the rising expenses that consumers had to pay out of their own pockets, in spite of increasing insurance coverage. Congress, the executive branch, and state governments were fearful of their impending fiscal crises in which expenditures were rapidly outstripping tax revenues; they wanted to restrain the rising costs of their medical care programs, which had increased from a fourth of total health expenditures before Medicare and Medicaid began to more than 42 percent in less than ten years.<sup>^^</sup>

By the time market conditions and rising State subsidies necessitated rationalization, the only substantial profit-making medical sector without sufficient protective support in the corporate class or other powerful sectors of society was the petty commodity sector—private practitioners. The control and regulation of physician services seemed inevitable because doctors'

## Epilogue I 209

orders for their patients' hospital stays and procedures were important elements in the meteoric rise in tax dollars being spent on Medicare and Medicaid as well as private expenditures for health services. Prepaid group practices, which originated in the 1920s and were strongly recommended by the Committee on the Costs of Medical Care, became a major part of the reorganization plans of rationalizers. Despite long-standing opposition from medical societies, the federal government promoted these prepaid plans, called Health Maintenance Organizations (HMOs). HMOs have a built-in incentive to keep costs down because they convert high utilization by patients from an asset to the provider, as in fee-for-service practice, to a liability when a person gets all his or her care for a monthly fee paid in advance.<sup>°</sup> Bureaucratic organization seems destined to replace solo private practitioners. In 1972, despite the AMA's enormous lobbying machine in Washington, the rationalizing forces won congressional approval of a bill to create Professional Standards Review Organizations (PSROs) that would establish utilization review over individual practitioners' services to Medicare and Medicaid recipients. Some state and local medical societies, wanting nothing to do with outside review even if it were controlled by the profession, threatened to boycott the required program. But the AMA Journal, acknowledging the handwriting on the wall, soberly warned physicians: "If we stand as a rock against the current, our base will be eroded and we will be swept aside. Organized medicine must remain elastic and adapt to our time. To do less is to invite extinction in the manner of dinosaurs and dodos. . . . There are perilous times ahead but we must participate if we are to prevail."<sup>^^</sup> As an example of their new realism, the AMA dropped its half-century-long opposition to any form of national health insurance and put forth its own "Medi-Credit" proposal to try to salvage for private practice physicians conditions that would permit their survival.

## DIVIDED THEY STAND

Just as the unity among elite private practitioners and medical school faculty dissolved after their victory over traditional doctors and medical sectarianism early in this century, so is the unity among corporate rationalizers more fragile now that their victory over private practice medicine is in sight. Hospitals, though the

## 210 I Epilogue

centerpiece of rationalized health care, have become the bete noire to groups trying to contain rising health care expenditures. The state and local Comprehensive Health Planning agencies, mandated by Congress in the mid-1960s, failed to put a sufficient brake on hospital expansion and escalating costs. Their successors, a somewhat strengthened network of Health Systems Agencies (HSAs) created by the National Health Planning and Resources Development Act of 1974 (P.L. 93-641), are another attempt to bring order to the economic chaos of the unregulated medical market and to avert the fiscal bankruptcy of the government's medical care programs. While these agencies, in combination with state-run Certificate of Need programs, will probably slow expansion of hospitals and their acquisition of very expensive equipment, they are unlikely to bring the different medical interest groups to heel.<sup>^^</sup>

Members of the corporate class, through business organizations and foundations, push for reform of medical care to improve its delivery of primary care services and to rationalize its organization and financing. The Committee for Economic Development (CED), a policy organization with representatives from nearly 200 major corporations, has urged the restructuring of medical care into HMOs, the development of national health insurance, and increased government planning and regulation of medical care providers.^ ^ Foundations similarly use their corporate wealth to encourage the coordination of care around hospitals and academic medical centers, with an emphasis on promoting "front-line" or primary medical care so badly neglected by the technology-oriented, medical market. The Robert Wood Johnson Foundation, with more than \$1 billion in assets derived from the Johnson and Johnson band-aid empire, spends its funds entirely in the health field. The Rockefeller Foundation, with assets over \$700 million, the Kellogg Foundation, with nearly \$1 billion in assets, the Kresge Foundation, with more than \$600 million in assets, and others all place great emphasis on reforming medical care.^\* Although their wealth is enormous, it is dwarfed by the health expenditures of the federal government each year. The foundations, therefore, concern themselves with developing model programs, which may then be taken over by the government, and with directly influencing policy in government as well as in medical care institutions.

## Epilogue I 211

The attempts of foundations and the State to rationalize health care have simply been superimposed over the market economy for health services. Despite their appealing rhetoric favoring coordination, integration, and planning, bureaucratic and corporate rationalizers are unable to control all the necessary factors in the production and provision of health services and products.^ ^ Doctors, hospitals, insurance companies, the Blues, drug and hospital supply and equipment companies, and medical schools all seek the commanding role in the health system—or at least the lion's share of its resources. Present rationalizing strategies conceal the disparity between stated goals and political and economic reality; they appeal to legislative and bureaucratic mechanisms to unify and integrate the system.

The failure of one mechanism is taken as evidence of the need for another patchwork mechanism. Endemic inflationary problems, caused in part by Medicare and Medicaid, were answered with Comprehensive Health Planning agencies, and their failure was the impetus for the creation of Health Systems Agencies (HSAs). Falk, the research director for the Committee on the Costs of Medical Care half a century ago, warned recently that the powerful interest groups in medical care will all be reluctant to let their interests be overridden by some higher social interest. But he is left with the strikingly naive hope that these "resistances will have to be overcome as far as possible by the reasonableness of the proposals and the persuasiveness of the explanations, and beyond that, by confrontations in the legislative arena."^ ^

Such mechanical solutions, which dominate health planning, ignore the substantial political and economic power that simultaneously unites and divides the system's interests. The medical care system has evolved into a glut of interest groups, none of which has sufficient power to prevail by itself. Although the proponents of corporate rationalization have prevailed over the petty commodity sector, they do not share among themselves an interest in the coordination and integration of the entire system. However, their occasional bickering among themselves—for example, over who will be regulated and how much^"—should not be mistaken for fundamental opposition. Corporate rationalizers and organized medicine share an overriding and unifying interest in the private ownership and private control of social resources. Each group is best able to promote its own survival, growth, and

## 212 I Epilogue

profits if it is not subordinate to either the State or any other interest group. Alford argues,

Differences between dominant and challenging interests should not be overemphasized . . . because both professional monopoly and corporate rationalization are modes of organizing health care within the context of a market society. Both must avoid encroachments upon their respective positions of power and privilege which depend upon continuation of market institutions: the ownership and control of individual labor, facilities, and organizations (even nonprofit ones) by autonomous groups and individuals, with no meaningful mechanisms of

public control.^\*

Thus the State has entered into the medical care arena very much as the foundations had. Whatever the intent of the supporters of specific legislative programs, federal and state programs have, in sum, furthered the transformation of medical care from simple commodities, produced and sold largely by private-practice physicians, to capital-intensive commodities, produced and sold by bureaucratic organizations that assemble large amounts of capital and hired labor and strive to accumulate a surplus of revenue over expenses.

State intervention to rationalize medical care thus benefited interest groups whose existence depends on technological medicine—especially hospitals, health insurance carriers, and medical technology industries—more than it helped the medical profession, although doctors gained financially, too. How did consumers fare in these developments? Did they also benefit from the State's rationalization of the private medical market?

## UP AGAINST THE MEDICAL MARKET

The combination of private and public third-party payment programs has reduced the gross inequalities in utilization of medical care, but these programs have neither eliminated the inequities nor provided health care matched to the population's health needs. Rather than need determining the allocation and distribution of health services, which equity would require, we find that services became distributed according to their prevailing markets. The "commodification" of health services remains the major cause of the inaccessibility of health services to the poor

## Epilogue I 213

and a major factor in the distortion of care to the entire society.

Over the last three decades private health insurance and public assistance programs have narrowed the gaps between the poor and nonpoor in their use of health services. Poor adults from eighteen to sixty-four years old now make slightly more visits to a physician on the average than do nonpoor adults. However, the poor at all ages receive less care relative to their need for medical care. The disparity between need and what's received is especially great for children.^'

The reasons for these class differences are not difficult to find. First, many physicians do not accept Medicaid patients because Medicaid programs, which are administered by the states within federal guidelines, pay less than doctors are used to getting from their privately insured patients. In California, only about a third of the state's obstetricians and gynecologists participate in the Medicaid program, leaving nearly a third of the state's fifty-eight counties without a single obstetrician or gynecologist to serve Medicaid women."^^ Second, white physicians and dentists generally do not locate their offices in poor or minority communities.^ Third, as of 1971 nearly half the country's 35.5 million people officially defined as poor had no Medicaid coverage."^^

Health insurance itself is distributed in part according to the class structure. Today 90 percent of all Americans have some form of health insurance, three-fourths of them from private insurance plans. In general, however, the most comprehensive health insurance is available to persons in higher paying occupations and in the dominant sectors of the economy, which are more unionized and can more easily pass along the costs of health insurance to consumers. In 1974 some 60 percent of the employed poor had no health insurance at all, and fewer than 10 percent were insured for nonhospital services."^^

While the growth of private health insurance and government third-party payment programs helped reduce the inequities, they do not cover all people or all health services equally well. In 1977 sixty-one cents of each dollar spent on personal health care services were paid by third-party payment plans, leaving consumers to pay thirty-nine cents of each dollar out of their own pockets. Third-party payers covered more than 90 percent of the cost of hospital care, but only 61 percent of physician fees and even less for drugs and other commodities.

## 214 I Epilogue

Thus, even with the government subsidizing medical care for the poor, the production and sale of medical care

as commodities are still distributed according to the class structure of the society rather than on the basis of need. However, those at the bottom of the class structure have not been the only ones to suffer under this market economy.

The market system has also distorted the character and supply of medical care for most of the population. The relatively complete private and public third-party coverage of hospital care has encouraged hospitalization for diagnostic and therapeutic procedures that could be done more safely and inexpensively outside hospitals—or avoided altogether.

Most surgery in the United States is done on a fee-for-service basis. Doctors get paid high surgical fees for the operations they perform, not for those cases in which they decide surgery is unnecessary. As Dr. Charles Lewis has observed, "Patient admissions for surgery expand to fill beds, operating suites, and surgeons' time."<sup>1</sup> The United States has twice the ratio of full-time surgeons to its population as England and Wales—and twice as high rates of surgery.<sup>2</sup> A congressional report estimated that in 1974 approximately 2.4 million unnecessary operations were performed in this country, resulting in 11,900 avoidable deaths and a cost of \$3.9 billion.<sup>3</sup>

Nationally, Medicaid patients have become a major source of revenue for "underemployed" surgeons and underutilized hospital facilities. Medicaid recipients undergo surgery at twice the rate of the general population and for some elective operations (that is, for conditions that are not life-threatening) the difference is even greater.<sup>4</sup> Many well-insured persons—whether they be privately insured members of the working class and middle class or government-subsidized members of the poor and near-poor strata—have been victimized by excessive care just as the poor have historically been victimized by being priced out of adequate medical care.

Physicians have concentrated themselves in specialties and locations where they can take best advantage of the market for their services. Because physicians have such a strong influence on the demand for their services, large numbers of doctors in even a relatively small but affluent area make an exceptionally fine living by ordering enormous numbers of diagnostic and therapeutic

## Epilogue I 215

procedures which they either perform or evaluate. Their market in the past relied mainly on the middle and upper classes, and because of the financial and bureaucratic constraints of Medicaid, doctors are still attracted more to the shrinking but well-off areas of big cities and the expanding suburbs than to poor and working-class areas. While affluent areas of Chicago average 210 physicians per 100,000 persons, poverty areas have sixteen doctors per 100,000—one-eighth as many physicians to population. Similarly, Mississippi has only a third as many doctors as New York state's abundant average of 244 per 100,000.<sup>5</sup>

Physicians have also abandoned primary care practice for more lucrative and prestigious specialties. General practitioners, who in 1963 comprised nearly 28 percent of the country's nonfederal physicians, by 1973 represented less than 18 percent of the total. If we add to these GPs those specialists whose practices are mainly focused on primary care—those in internal medicine, pediatrics, gynecology, and family practice—still less than half of all U.S. physicians are involved in primary care. By contrast, prepaid group practices average 69 percent of their physicians in primary care and the British National Health Service includes 74 percent. This leaves the United States with only sixty primary care physicians per 100,000 population, far below the ratio of 133 such doctors per 100,000 persons recommended as necessary to provide adequate primary care.<sup>6</sup>

Since the turn of the century, the generalist and primary care have taken a back seat to specialized practice and sometimes even a career in medical research. The countryside, with its limited market for specialty services and its isolation from centers of technological medicine, cannot compete with more densely populated urban areas with their hospitals linked to research-oriented medical schools. Rural areas were of no interest to modern physicians, and the urban poor were of interest only when they served as research or teaching material. The technological imperative in medicine combined with the market organization of medical care to divert physicians from areas and types of services in which they were most needed to those that were most interesting, profitable, and professionally rewarding to them. In sum, the private medical market has remained a major contradiction in efforts to provide an accessible system of medicine geared to the needs of the population.

# NATIONAL HEALTH INSURANCE: MORE OF THE SAME

It can be stated as almost a certainty that national health insurance in the United States will continue to promote capital-intensive medical care in a market system. Each major medical interest group is represented by a bill in Congress. The AMA, the insurance industry, and the American Hospital Association have all submitted bills that would favor their members. The AFL-CIO and most bureaucratic professionals support the successive bills sponsored by Senator Edward Kennedy. The Kennedy bills would go farther than other national health insurance bills in providing comprehensive and accessible care. Some versions of the bill would even eliminate any administrative or third-party role for insurance companies. All versions include an incentive payment system to encourage physicians to join prepaid group practices. While the Kennedy proposals would weaken the financial base of fee-for-service medicine, none of them would eliminate it nor would they eliminate the professional control of hospitals and medical schools.

Only one proposal now under consideration would radically alter the commodity system of medical care. The Health Service Act, a bill sponsored by Representative Ronald Dellums, would create a national health service that would employ physicians and all other personnel on a salaried basis, take over the nation's hospitals, control the production of health workers in medical schools and other training programs, eliminate insurance companies from health care, and reduce the hierarchy of power among health workers by subordinating all policy to community-based boards. The Dellums bill would effectively transform the commodity production of medical care into noncommodity "social production." Were the Dellums proposal implemented, it would give the United States one of the most advanced health care systems in the world, surpassing the most progressive systems in Western Europe and perhaps equaling the organizational rationality and public service character of health care in many socialist countries. The Dellums bill is supported by a small proportion of bureaucratic professionals, some of whom are leaders of the American Public Health Association, and by left-of-center

## Epilogue I 217

political groups. So thoroughly does it assault every vested interest in health care and the ideological tenets of capitalist society that it is a virtual certainty that the Dellums bill will not see the light of legislative victory in the near future. Nevertheless, it may serve as a model for those who want to reform the U.S. medical care system.

The more far-reaching of the Kennedy bills are also unlikely to win congressional approval. Their attacks on the interests of the AMA, the best-financed lobby in the country, and the insurance industry, not only a powerful lobby but a controlling force in the nation's economy as well, make their legislative future very dim. The other bills submitted by medical interest groups will also fail because they too narrowly support the interests of one sector of the industry. Instead, an administration-sponsored bill will become the foundation of national health legislation, with amendments and revisions made to accommodate the more powerful interest groups that have entered the fray.

The legislation that emerges from this process will undoubtedly favor the medical market and enhance the capital-intensive sector of the system. It is likely that whatever plan is adopted will convert additional services that are now provided by the government into commodities that can be bought and sold on the private market.^^ The insurance system will organize the collection and payment of private funds into this commodity system with federal tax dollars subsidizing only those who are priced out of the medical market, thereby increasing the access of those groups to medical care. While national health insurance will probably encourage a slight redistribution of physicians, geographically and between specialties and primary care, it will not break up the power of interest groups and their manipulation of the medical market to their advantages. It is likely that national health insurance will push doctors toward prepaid group practice at a slightly faster rate, and it will strengthen the control of most dominant interest groups—especially the hospitals, medical schools, insurance companies, and drug and medical supply industries. More regulation will be developed to restrain inflationary forces, somewhat protecting the interests of the State, and to prevent the competitive interests of each segment from destroying the medical care system they share. In other words.

through national health insurance, the State will intensify the capital-intensive commodity production of medical care and rationalize the medical system in ways that further the common interests of the system's dominant members. If this sounds familiar, it should. National health insurance essentially promises to give us more of the same.

Given the present size and importance of the medical commodity sector and the absence of militant demands from the underclasses, the State will continue to develop the role it has increasingly taken over from foundations since World War II. It will protect and promote a medical care system that is compatible with corporate capitalist society's economic and political organization—not only in the organization of medical care, but in its content as well.

## TECHNOLOGICAL MEDICINE

After World War II, the State rapidly replaced foundations as the major source of financial support and direction in medical research and education, just as it did in medical care. As the remainder of this chapter will demonstrate, the State, like foundations and wealthy individuals before it, continued to promote and develop a narrowly technical and ideologically conservative type of medicine—despite the overwhelming evidence that broad factors in the physical and social environment have at least as great an impact on health status as the microbiological factors that receive most of the attention.

## SCIENTIFIC MEDICINE: BELIEFS AND REALITY

Nearly all of us turn to medicine when we are sick. Whether the healer is called a shaman, a witchdoctor, a priest, a feldsher, or a physician, we all seek someone in whom to place our confidence, someone we believe will make us well. Early in the nineteenth century, most Americans relied on lay healers. By the middle or latter part of that century, most Americans turned to physicians, who were being prodigiously produced in mushrooming medical schools throughout the land. At the time, one could choose the particular medical theory one wanted in a physician—from homeopathy to orthodox or "allopathic" medi-

## Epilogue I 219

cine—or the particular type of healer—from herbal traditions to Christian Science. Not until the last two decades of the last century were there any significant number of physicians who practiced what they called "scientific" medicine, meaning a medical practice based on principles continuously being developed and refined by the analytic biological and physical sciences.

Today most of us look to doctors and hospitals and surgery and drugs to cure us of every ill. We want solace, and, therefore, we expect it. The medical profession has, of course, encouraged such beliefs through its campaigns to increase the confidence of the populace (described in Chapter 2). Other medical interest groups, like the American Cancer Society and the National Cancer Institute, have joined in the campaign for public confidence, frequently hosting briefing sessions for newspapers' science and medical writers to learn about the "latest advances" in cancer treatment. We have come to credit scientific, technological medicine with having reduced the enormously high death rates of past centuries and with being effective against most disease and suffering in our time.^^ Yet such past successes and current prowess are greatly exaggerated.

## LIFE, DEATH, AND MEDICINE

## THE HISTORICAL RECORD

Historical epidemiological evidence overwhelmingly supports the conclusion that medical science has played a relatively small role in reducing morbidity and mortality. Thomas McKeown^^ argues very convincingly that improved health and the great decline in Western Europe's total death rate from the eighteenth century to the present were due to four factors. First, nutrition improved because food supplies increased from the early eighteenth century, due initially to the reorganization of agriculture rather than improved chemical or

mechanical technology. Second, environmental sanitation measures—cleaning up the accumulated filth of the cities, assuring uncontaminated water supplies, and so forth—instituted by the late nineteenth century added to improved nutrition and further reduced mortality, particularly of children. These measures were well underway by the middle of the century, before either the concept of specific

## 220 I Epilogue

causes of disease or the germ theory was widely accepted. Third, these improvements in the standard of living caused a substantial increase in population, which would have overrun the gains in health if birth rates and family size had not soon sharply declined. Finally, specific preventive and therapeutic medical measures gradually introduced in the twentieth century strongly accelerated the already substantial decline in mortality and also improved physical health. While science greatly extended the original nontechnological advances in agriculture, hygiene, and birth control, the contribution of medical science to the overall reduction in death rates and improved health was relatively quite small.

In the great majority of cases the toll of the major killing diseases of the nineteenth century declined dramatically before the discovery of medical cures and even immunization. Tuberculosis, the Great White Plague, was one of the dread diseases of the nineteenth century, killing 500 people per 100,000 population at midcentury and 200 people per 100,000 in 1900. By 1967 the U.S. rate had dropped to three deaths per 100,000. This tremendous decline was only slightly affected by the introduction of collapse therapy in the 1930s and chemotherapy in the 1950s.^^ Similarly, for England and Wales John Powles shows that overall mortality declined over the last hundred years well in advance of specific immunizations and therapies."

Rene Dubos, the microbiologist formerly with the Rockefeller Institute, succinctly summed up the historical record. "The tide of infectious and nutritional diseases was rapidly receding when the laboratory scientist moved into action at the end of the past century," Dubos wrote in *Mirage of Health*. "In reality," he observed, "the monstrous specter of infection had become but an enfeebled shadow of its former self by the time serums, vaccines, and drugs became available to combat microbes.""

Improvements in general living and working conditions as well as sanitation, all brought about by labor struggles and social reform movements, are most responsible for improved health status. Improved housing, working conditions, and nutrition— not medical science—reduced TB's fearsome death toll. Responding to riots and insurrections as well as the pitiable living conditions of the poor and working classes in Western Europe and North America, nineteenth-century reformers brought dra-

## Epilogue I 221

matic declines in mortality without the benefit of even the germ theory.^^"

Children have benefited the most from these changes. The average baby born in 1900 could have expected to live only forty-seven years. A baby born in 1973 can expect to live more than seventy-one years. Most of this increased life expectancy at birth has been due to a sharp decline in infants' and young children's deaths from infectious diseases. At the turn of the century young children succumbed to influenza, pneumonia, diarrhea, scarlet fever, diphtheria, whooping cough, and measles. By 1975 the infant death rate had fallen to sixteen per 1,000 live births—less than one-ninth the rate in 1900. And the death rates of young children have similarly declined.^^ Improved housing, nutrition, water supplies and waste disposal, pasteurization of milk, and the virtual elimination of child labor (except for migrant farm workers) drastically cut the spread of infectious diseases and enabled children's bodies to resist them.

## LIFE, DEATH, AND MEDICINE TODAY

The physical and social environments are just as important in determining disease and death rates today as they were historically, despite the fact that "degenerative" diseases, such as heart disease, cancer, and stroke, have replaced most of the infectious diseases as leading causes of death.

Infant death rates are still strongly influenced by environmental factors. Twelve countries—Sweden, East

Germany, and England among them—have lower infant death rates than the United States. Within the United States an infant born to a black mother with eight years of schooling or less is three times as likely to die before its first birthday as a baby born to a white college-educated mother. Although white and black infant death rates have decreased in parallel through most of this century, the death rate for black infants has remained consistently about twice the rate for white babies. And a baby born into a poor family, white or black, is much more likely to die than if he or she were born into a nonpoor family.^ ^

Indeed, a person who is poor or nonwhite is more likely to die at every age. Nonwhite children die at twice the rate of white children. Up to the age of sixty-five, nonwhite male death rates exceed white male death rates by 40 to 95 percent, and nonwhite

## 222 I Epilogue

females die at more than twice the rate of white females in most age groups.\*" The probability of being disabled (temporarily or permanently) is negatively related to income and education, but positively related to being black.\*' The more privileged your class, race, education, and occupation, the less likely you are to get sick or die at each age.\*^ As epidemiologist Warren Winkelstein put it, poverty "remains among the most powerful determinants of altered health status and clinical disease today. It may well be that elimination of poverty in and of itself would drastically alter the health status of the population in a favorable direction.""

Environmental and occupational pollutants are also major determinants of disease and death rates. Even "normal" levels of air pollution have been associated with increased rates of disease. Air pollution causes temporary deterioration of lung function and increased frequency of lower respiratory tract infections in children, in whom smoking and occupational dust exposures are assumed to be minimal. Air pollution is also associated with lung, stomach, and other forms of cancer, as well as chronic bronchitis and asthma.\*'^

More than 14,000 workers are killed each year in work accidents, and between 2.5 million and 5.6 million workers suffer temporarily or permanently disabling injuries on the job. Occupation-related diseases are estimated to kill well over 100,000 persons each year." Even the president of the Blue Cross Association has estimated that "31 percent of workers' health problems are caused by factors in their environment."\*\*

Social relations—the patterned ways in which individuals relate to one another in society—also have a broad and dramatic impact on how healthy people are and how long they live. Hypertension, or high blood pressure, is associated with the stresses of moving to or living in industrialized, urban society; it is also related to working at high-pressure jobs and to being poor or black.\*" The poor and racial minorities have higher rates of alcoholism, mental illness, and homicide, and nonwhites at every age die at rates 40 to 100 percent higher than those of whites. From birth to old age, males have higher rates of death than females, including death from many stress-related diseases, such as heart attacks and strokes, and from many nondisease causes of death, such as auto accidents, work accidents, homicides, and

## Epilogue I 223

suicides/\* Even whether labor is alienated or satisfying is related to life expectancy. A Department of Health, Education, and Welfare task force reported that "in an impressive 15-year study of aging, the strongest predictor of longevity was work satisfaction."^^ Clearly, people's social roles and their positions in the social structure have a major impact on their health.

Health and disease are thus determined by a combination of factors. Genetic inheritance is one conditioning factor, and the social, economic, and physical environment into which people are born and in which they must live are other critical factors. These factors determine the person's receptivity to disease as an unwitting "host." Whether a person remains healthy or gets sick is determined by inheritance, environment, and external "insults" to the person—bacteria and viruses, chemical and physical assaults on the body, social and emotional assaults.

Technological intervention in this process is very limited. Robert Haggerty, a nationally respected pediatrician, recounts some of the limitations of children's medicine in the 1970s:

We do not know how to prevent or treat effectively most of the major killing disorders of childhood in the United States. . . . The state of knowledge about acute and chronic conditions that usually do not kill but impair function for short or long periods is not much better. There is little we can now do to prevent or treat specifically most acute respiratory infections or chronic handicapping conditions.'

Efforts to improve medical care in very poor communities have had only a slight impact on people's health. A well-known project that brought advanced primary care to a Navajo community succeeded in reducing the recurrence of active tuberculosis and the prevalence of infections of the middle ear but had little or no effect on the pneumonia-diarrhea complex which continued as the biggest single cause of illness and death as it had throughout the country up to half a century ago. By the end of the experiment the infant mortality rate for the community remained about three times the national average." Other experiments in the United States and underdeveloped countries have had similar results."

These sobering observations of the limits of medicine and the importance of the environment should reduce our enthusiasm for

## 224 I Epilogue

turning to medical science and physicians to cure all our ills. But we need not become "therapeutic nihilists" in the process. While we reject the popular mythology that cloaks medicine in robes of omniscience, while we reject the unquestioning assumption that technology can solve all our health problems, we must recognize the advances and considerable value of modern medicine. Until the 1930s all but a few drugs were palliatives, at best relieving the symptoms of a disease. Sulfonamides were developed in the 1930s, penicillin in the 1940s, and other antibiotics in the 1950s. All were major additions to the arsenal of physicians in the long-anticipated "war against disease." The most rapid development of technical advances in medicine occurred from the late 1930s, accelerated during and after the war in the 1940s, and peaked in the 1950s.

Only some medical care, however, has had a significant positive impact on the health status of the population. Campaigns to immunize the population with polio vaccines, introduced in the 1950s, have reduced one of the most dread childhood diseases from 18,000 cases in 1954 to only six in 1975. Rubella (or "German measles"), which in pregnant women can cause devastating congenital defects in their offspring, was reduced from an average of more than 47,000 cases a year before widespread use of the vaccine to 16,343 cases in 1975, following even limited immunization of the population."\*

Good maternal health services—including prenatal and maternal medical care and coordinated social services—provided to the entire population could materially reduce infant mortality rates. David Kessner and other researchers, who carefully studied New York City births in 1968, concluded that adequate maternal health services provided to all women in the city would have reduced infant mortality there by one-third. The percentage of low-birth-weight infants and infant deaths both decreased as the adequacy of maternal health services increased, within each racial, socioeconomic, social-risk, and medical-risk group. Among college-educated mothers, the infants of those with inadequate care were twice as likely to die as the babies of those with adequate care. Among black college-educated mothers, the infant death rate for those with inadequate maternal care was six times as great as the rate for those with adequate care." As valuable as good maternal care is, however, one-quarter of the

## Epilogue I 225

substantial decline in the infant mortality rate in the late 1960s is accounted for by women giving birth at lower risk ages (mainly in their twenties) and having fewer children."\*\*

Thus, comprehensive health services can have a limited but positive impact on health status. Some vaccines have substantially reduced infectious disease and death rates, although historically most have simply accelerated already falling rates. Antibiotics and sulfa drugs have also reduced disability and death from infectious diseases. Recently developed antibiotics have greatly reduced the isolation and convalescence of TB patients. Adequate maternal care can lower infant mortality rates although most of the decline has been and is

still due to improvements in environmental conditions and patterns of child-bearing. In general, comprehensive primary medical care can help limit the progress of disease and help restore a sick or injured child or adult to healthy development and functioning. When distributed throughout the population, such care can contribute to improving the general health status of that population. When combined with social reforms—particularly ones that would eliminate the inequities of class, the brutality of racism, and the destruction of the physical environment — good technological medical care and supportive personal and social services can reduce the burden of disease an individual, a family, or a society must bear. From the Progressive era to the present, however, foundation- and government-sponsored medical research and medical care have been narrowly technological and ideologically conservative.

## TAPPING THE STATE TREASURY

Up to World War II foundations were the leading force, besides the medical profession, shaping the direction of medical education and research and, ultimately, medical theory and practice. By 1940 the Rockefeller philanthropies alone had contributed more than \$161 million to medical education and medical research.""

Until World War II the federal government's support for medical research and education was minor. In 1938 the Public Health Service's research budget amounted to only \$2.8 million. In order to develop and apply medical research to the country's war needs, however, the Committee on Medical Research was set

## 226 I Epilogue

up in 1941 in the new Office of Scientific Research and Development. By 1944 the committee had received \$15 million to allocate to medical research activities."\*

After the war federal support for medical education and research blossomed. The AMA's opposition to direct financial aid for medical education was circumvented by channeling Hill-Burton funds to teaching hospitals and turning on the spigot of federal support for medical research, both of which the AMA approved. The National Institutes of Health became the major single source of medical research money. Its research budget doubled from \$28 million in 1950 to \$60 million in 1955, and doubled again every two or three years up to 1963. By 1975 total federal health research expenditures reached \$2.8 billion, sixty cents out of every dollar spent by all sources on health research. While the federal government's expenditures increased more than thirty-six times in this period, philanthropy's contributions increased only six times."^

What was responsible for this astronomical increase in State support for technological medicine? Three sets of interests benefited from this emphasis on and funding of technological medicine—the academic medical profession, the corporate class as a whole, and corporate and medical interests that profit from medical technology. It was largely these groups that opened and sustained the pipeline from the federal treasury to medical research and technological development.

## A "SUPERACADEMIC GENERAL STAFF"

First, an influential medical research elite has grown up around medical schools, universities, private research laboratories, and teaching hospitals and clinics. Medical schools, however, have been the main beneficiaries of the foundation and government largess for research, receiving the largest share of the money and having the greatest influence in the direction and organization of medical research. Since World War II medical school research funds have increased faster than operating income. By 1953, research grants accounted for more than a fourth of total U.S. medical school income. Federal support for medical school operating and research expenses continued to grow, topping \$1.4 billion in 1973, most of it in research

## Epilogue I 227

subsidies. By the late seventies about sixty cents of every dollar spent by medical schools were provided by the federal government, three times its share in 1950.\*^

The ranks of full-time researchers and teachers among physicians swelled to match the availability of funds. The

government, like the Rockefeller philanthropies under Frederick T. Gates, encouraged the expansion of full-time clinical faculty—from 2,200 in 1950 to 24,000 in 1973, a 1,100 percent increase! Doctors engaged full-time in medical teaching or research increased from less than 2 percent of all physicians in 1950 to nearly 5 percent in 1973.«^

The bonanza of federal dollars bestowed on medical schools since World War II fragmented them into collections of virtually autonomous departments. Departments and institutes of full-time faculty and researchers grew like mushrooms in response to one or another funding program. Empires were built by prominent faculty members who seemed to have a direct line to the National Institutes of Health. Medical school and teaching hospital administrators, wanting to expand their own domains of facilities and staff, courted foundation and government officials responsible for doling out research funds as well as the faculty who attract the grants and contracts. Faculty members who excelled at grantsmanship, rather than those who were the best teachers, were favored with money and prestige, and became models for medical students.\*^ The situation remains unchanged today.

Prominent members of this academic medical elite not only control the considerable sums of research money that they receive from outside, or extramural, sources; they also have a major role in determining who else will receive such funds. Moving easily among medical schools, institutes, foundations, and government agencies, this national academic elite has become a formidable interest group. Even by 1927 Hans Zinsser complained that the "guidance of medical education is to a considerable extent passing out of the hands of the universities" and into those of a "superacademic general staff."\*^

Following the dictates of their training, their intellectual and practical competence, and their material interests, this academic medical lobby has promoted technological and curative medical research that has focused largely on hospital and medical school

## 228 I Epilogue

clinic patients. They encourage the appropriation of money for health research, and they shape the specific research directions and programs for which money is given.

But they and their institutions are dependent on outside sources for both capital and operating expenses, and they tend to be very responsive to agencies that foot their bills. They have been supported by the larger medical profession which benefits from the production of knowledge and technique (some of the commodities of medical practice), but more fundamental support comes from outside the health professions. That support depends on the interests and programs of this dependent group coinciding with the interests and strategies of economically and politically more powerful groups. At first, foundations and then the federal government provided that financial support and exercised the control that goes with it, just as the AMA's Journal had feared and warned the profession against as early as 1901.\*\*

## THE CORPORATE CLASS

As in the organization of medical care, foundation and government programs in medical research represent the interests of the corporate sector of society. From the founding of the Rockefeller Institute for Medical Research in 1901 to the present time, substantial sums of corporate wealth have supported medical science and its technological applications. In 1975 foundations contributed \$64 million, mainly income from their corporate investments, to health research while private industry itself spent \$1,322 million on medical research and development.\*^ Even more important has been the strong political support by foundation and corporate leaders for increasing appropriations from the vast federal treasury. Private wealth accounts for only a third of national health research expenditures, but it has been influential in generating the other two-thirds from the State.

The reasons for this support include the same considerations that led to the founding of the Rockefeller Institute. As we found in Chapter 3, Gates and other members of the corporate class embraced scientific medicine because it supported their political and economic struggles. Technological medicine provides the corporate class with a compatible world view, an effective

technique, a supportive cultural tool, and a focus on the disease process within the body that provides a convenient diversion from the health-damaging conditions in which people live and work.

Continuing its earlier policies, the Rockefeller Foundation spearheaded efforts in the 1930s to develop a scientific biological perspective in medicine and to integrate chemistry and physics with biology. The Rockefeller, Macy, Milbank, and Ford philanthropies also generously supported the development of research into mental illness, almost exclusively focused on physiological factors with a little behavioral research.\*^

Like the foundations and individual capitalists earlier in the century, federal health research has focused on the narrowly technical components of disease and death rather than on the broader economic and physical environments so central to the population's health status. Cancer research is a prominent but typical example. Throughout its existence since 1937, the National Cancer Institute (NCI) has sought the key to understanding the etiology, cure, and prevention of cancer largely in microbiological research. In 1971 the Nixon administration launched a grand "war on cancer," the second leading cause of death, and gave the NCI a hefty 62 percent boost in its appropriations for the next year, the biggest since a 90 percent increase it received in 1957. By 1977 the NCI's annual budget had grown to \$815 million— three and a half times the pre-"war" level.\*"

Neither the National Cancer Institute nor the American Cancer Society has shown much interest in investigating the environmental contribution to cancer. A committee of the NCI's National Advisory Cancer Board expressed its "astonishment" that the National Cancer Program allocated only 10 percent of its budget to this area. In 1975 the NCI expanded its environmental carcinogens program to \$100 million, an impressive sum except that it is only 17 percent of the NCI's budget for the year. This miserly proportion devoted to environmental causes of cancer seems especially ironic because NCI director Frank J. Rauscher, Jr., publicly stated on several occasions the widely substantiated view that up to 90 percent of all cancers originate in the environment. According to federal health officials, epidemiological evidence demonstrates that at least 20 percent—and perhaps 40 percent—of all cancer cases are caused by occupational carcinogens, the most neglected area of environmental cancer research.\*®

## 230 I Epilogue

The more dominant lines of research focus on possible viral causes, hereditary factors, and immunological defenses in the etiology of cancer. The so far unproductive search for a viral origin for human cancer cost three-quarters of a billion dollars by 1977. This and other lines of microbiological research have contributed only marginally to improving survival rates for most cancer victims. Rauscher boasted in 1974, "The 5-year survival rate for cancer patients in the 1930s was about 1 in 5. Today, the figure is 1 in 3." However, Daniel Greenberg notes, "virtually all of this improvement was achieved prior to 1955, which, ironically, was when federal spending for cancer research began to accelerate to its present level." Greenberg chalks up much of the improvement in survival rates through the midfifties to the postwar introduction of antibiotics and blood transfusions that reduced the death toll due to cancer surgery. "It wasn't that more patients were surviving cancer^" Greenberg asserts, "rather, they were surviving cancer operations that previously killed them." In Greenberg's view the contributions of chemotherapy, radiation therapy, and new surgical techniques have been negligible.^ ^

Typified by the federal cancer research program, lavish funds are available for microbiological investigations of many diseases, but relatively scant support is provided for research on occupational and other environmental causes. At most, one-sixth of all federal health research dollars in 1977 were spent on environmental factors. One out of every five working coal miners in the United States is a victim of black lung disease (which kills 4,000 miners each year), and on the average one miner is killed every other day in mine accidents. Yet the amount of money per miner spent in the United States for studying ways to improve miners' occupational health and safety is only one-twentieth of that spent in the majority of European countries.\*"

This neglect of occupational and environmental bases of disease and death is not primarily due to conspiracy. The medical profession is, as we have seen in previous chapters, tied to the corporate class. Office-based

physicians' median incomes reached \$63,000 in 1976, placing them in the top few percentiles of the society's income structure.'^ Physicians in private practice earn their money from a market system of medical commodities, encouraging a conservative "free enterprise" political perspective and a sympathy for other entrepreneurs in the capitalist system.

## Epilogue I 231

Medical researchers may be free of the influence of the medical commodity marketplace, but to win fame and fortune they must obey the rules of the medical research funds "market." Their dependence on foundation and government funding agencies restricts the range of problems and methods they may investigate and constrains their creative intellectual processes as well. The malignant neglect of occupational and environmental, social, and economic factors in medical research is thus due to the lopsided financial support provided for narrow microbiological investigations, the financial and class interests of the medical profession, mechanistic and reductionist medical theory, and the correspondingly narrow technical training of physicians.

Underlying these largely institutional and class factors, however, are the deliberate policies of major corporate and political institutions. Foundations, corporations, and government agencies differ among themselves and over time in their financial and political support for social versus technical perspectives in medicine. But in the long run and at any time they overwhelmingly support technical perspectives that separate health problems from their social and political contexts. Their policies reflect a general corporate class concern that any excess sickness and death not be attributed to the admitted inequities of capitalist society or to the organization of production that places profits before environmental protection and workers' health. In addition to this broad class interest in legitimation, however, a growing interest group within the corporate class has a direct financial stake in the dominance of technological medicine.

## THE MEDICAL-INDUSTRIAL COMPLEX

The interests of doctors, hospitals, research scientists, and medical industrial corporations all coincide in the promotion of expensive medical technology. They have built a profitable symbiotic relationship based on the commodity system of medical care and society's cultural affinity and ideological support for technological medicine.

A recent report of the congressional Office of Technology Assessment showed how the introduction of new medical technologies creates or expands a market. Most of the risk capital is supplied by the government although the profits derived from the products of this research are taken by private industry. In 1975

## 232 / Epilogue

the federal government provided about \$2.8 billion out of a total of \$4.6 billion spent on health research and development. State and local governments picked up about 5 percent of the total, and private nonprofit agencies gave another 5 percent. These public and private funding agencies provided almost all the funds for basic research, the fundamental laboratory and clinical science work that develops new knowledge in medicine. The \$1.3 billion spent by private industry, together with a healthy chunk of government money, went mainly for product development, applying knowledge gained from basic research to the creation of technologies that can be used in medical care.^ ^

Private industry not only controls the fourth of all this research and development money it spends; it also determines whether the knowledge generated by basic research will be made available as new medical products. Since both kinds of decisions are based on the expected profitability of any investment rather than on the basis of medical need and safety, it is not surprising that drugs and equipment of questionable usefulness and often significant danger are produced and that other medically useful products fail to be developed.^ ^

Once a product or service is developed, the major medical interest groups determine its market. The commodity's producers extol its advantages and push for acceptance and sales. If the drug, instrument, or procedure increases the technical effectiveness of physicians, it is likely to be ordered by them. If it increases the status or incomes of physicians, it is also likely to be used. If its availability in a hospital is likely to attract

physicians or otherwise produce income, hospitals will want to buy it. If third-party payers will foot the bill, it is a certain winner. The growth of clinical laboratory testing illustrates the effectiveness of these market forces.

Automated blood analyzers, first introduced in the 1950s and perfected in the years since, make it possible to perform many "extra" tests on a single sample of blood, at a low unit cost but at a high aggregate cost. Physicians order increasing numbers of tests which were previously considered unnecessary and which are, to many analysts, not necessary "for even the most rigorous medical practice." Physicians frequently fail to use the results of tests they have ordered. As fears of malpractice suits increased, doctors began expanding the limits of "defensive medicine,"

## Epilogue I 233

ordering ever larger numbers of tests to protect themselves against "litigious" patients. The growth of third-party payment programs facilitated increased use of clinical laboratories, and hospitals found it economically desirable to expand their laboratory capacities. Between the added fees doctors could charge, the economic "necessity" that hospitals felt, the facilitation of third-party payments, and the advertising of equipment and supply companies, the number of clinical laboratory tests reached 5 billion in 1975 (an average of twenty-three tests for every woman, man, and child in the country) and is increasing by 11 percent a year. Although automated laboratory equipment is expensive—for example, the latest automated blood chemistry analyzer (the SMAC 60) costs more than \$250,000—it represents only a minute fraction of the costs generated by clinical laboratory technology. The \$375 million spent on laboratory instruments in 1975 was only 2.5 percent of the \$15 billion bill for clinical laboratory testing, most of which went for space, supplies, maintenance, personnel, and profits for the laboratories and physicians.^\*

The cost of this and other medical technology in a commodity medical care system is enormous and rising at essentially geometric rates. Medical technology is estimated to account for half the increase in costs of hospital care from 1965 to 1974, a period in which hospital expenditures tripled.^ ^

In the days when Frederick T. Gates dreamed of medical research laboratories unlocking nature's secrets, medical technology was a fledgling business. Today the "medical-industrial complex" is a huge business that sops up an increasing share of national health expenditures for products and services that return a handsome profit to manufacturing and sales companies, researchers, hospitals, laboratories, and doctors. However, the economic return to these interest groups and the political value of technological medicine to the corporate class were not enough to overcome the serious economic problems caused by medical technology in a subsidized market economy.

## TECHNOLOGY IN CRISIS

As hospitals increased their charges at more than twice the rate of inflation in the rest of the economy, as health expenditures

## 234 I Epilogue

took a bigger and bigger bite of national resources and the federal budget, as medical fringe benefits consumed more corporate income and medical expenses cut into more and more of workers' incomes; government, corporate, union, and consumer leaders grew critical of the endless expansion of capital-intensive medicine. Besides demanding regulation of hospital expansion and the imposition of cost controls, these groups' political support for the expansion of medical technology fell off sharply. The market system's tendency to produce and absorb an inordinately expensive medical technology forced an examination of the value of that technology.

Dr. David Rogers, president of the giant Johnson Foundation, whose wealth emanates from the medical supply business, called for "technologic restraint."^^ Anne Somers, usually an advocate of the hospitals' interests, succinctly summarized the case against unlimited expansion of technological medicine: "The more advanced and the more effective the technology, the greater the overall costs of health care."^"

By the midsixties support for continued growth of technological medicine began to wither. Rapidly increasing

health expenditures and the well-documented role of medical technology in pushing up those costs darkened the previously bright future for medical research and its applications. The war in Vietnam was competing for federal tax dollars while the anti-war movement and the rapidly growing movement to protect what was left of the environment undermined political support for indiscriminate technological development. The virtual war in American cities in the midsixties, whose demands were articulated by the civil rights and black liberation movement, forced increasing appropriations for improving inner city services, including medical care. The combination of all these factors reduced political support for technological medicine—and cut into medical research's share of health expenditures. Federal appropriations for health research, which had increased 745 percent between 1955 and 1965, increased less than a fifth that much in the next ten years.^ ^

Foundations and the government increased their support for the study of medical care delivery problems. They supported experiments and reforms that would either lower the costs of medical care or improve access to low-technology primary care. They also gave new life and prominence to an old medical

## Epilogue I 235

ideology—one that justified clamping down on medical care expenditures and provided a substitute for the legitimizing functions performed by the increasingly discredited medical technology.

## BLAMING THE VICTIM: NEW PROMINENCE FOR AN OLD IDEOLOGY

At first the criticisms of technological medicine focused on the many systemic factors that increased its use. Medical economist Victor Fuchs criticized the "technological imperative" in medicine, the attitude that if something technological can be done for a patient, it should be done.^ Fuchs attributed this accelerator tendency to the training of physicians, the reimbursement insurance system that encourages the use of costly services, drug and medical supply companies pushing their products, and pressure from patients.

Disenchantment with medicine's technical effectiveness, or rather its ineffectiveness and its dangers, reinforced the attack on medical technology that began with medicine's fiscal problems. Doubts about all this emphasis on medical technology spread from a small coterie of academic critics in the 1950s to the highest policy circles of government and foundations in the 1970s. In the latter half of the fifties, Rene Dubos^°° and a handful of other observers were pointing out the futility of relying on medicine to cure the ills created by social and physical environments. In the seventies Jesuit priest and social philosopher Ivan IUich,^°^ Canadian Health and Welfare Minister Marc Lalonde,^""^ and others^°^ criticized medicine for the disease it breeds, for its relatively small positive impact on health status and disease rates, and for extending its domain of control to more and more of our social and personal relations.

One outcome of this criticism was the belief that what doctors and medical technology were doing badly, we could do better for ourselves. Critics of medicine advocated individual "self-help" as a source of liberation from professional and technological control. Many of them, however, extended this position to identify individuals as the greatest dangers to their own health. A large-scale study of health behavior in CaUfornia supported the view that a person's "lifestyle" is a powerful determinant of his or

## 236 / Epilogue

her health status.^""^ Fuchs, ignoring contrary epidemiological evidence, asserts that "the greatest potential for reducing coronary disease, cancer, and the other major killers still lies in altering personal behavior.""^ A host of other academic health researchers and writers and members of the growing "holistic" health movement fastened on the individual as the core of health problems. ^°^ Perhaps the ultimate absurdity of this position blames lead poisoning of young children in low-income neighborhoods on maternal deprivation^""^ and "permissive socialization of oral behavior" ^°^—instead of on landlords who fail to remove the lead-based paint peeling from walls of their rental units and to repaint with lead-free paint now required by law.

These arguments quickly caught the attention of major health policy makers. Walter McNerney, president of the Blue Cross Association, argues.

We must stop throwing an array of technological processes and systems at lifestyle problems and stop equating more health services with better health. . . . people must have the capability and the will to take greater responsibility for their own health.

109

Technological medicine is becoming prohibitively expensive, but victim blaming is cost-effective. "The cost of sloth, gluttony, alcoholic intemperance, reckless driving, sexual frenzy, and smoking have now become a national, not an individual, responsibility, all justified as individual freedom," asserts Dr. John Knowles, the influential president of the Rockefeller Foundation. "But one man's or woman's freedom in health is now another man's shackle in taxes and insurance premiums." Knowles sternly warns that "the cost of individual irresponsibility in health has become prohibitive." ^° Fuchs attacks what he sees as "a 'resolute refusal' to admit that individuals have any responsibility for their own distress." "" And Leon Kass, denying that health or health care is a ri^ht, proclaims that "health is a duty, that one has an obhgation to preserve one's own good health." Kass, a professor of medicine and bioethics, goes on to condemn "excessive preoccupations with health" such as "when cancer phobia leads to government regulations that unreasonably restrict industrial activity or personal freedom." ""^

Individual failure has long been used to explain why the poor and racial minorities use many physician and dental health services, especially preventive ones, less than more affluent

Epilogue I 237

groups do. Health professionals and their academic colleagues often conclude that low utilization reflects inadequate knowledge of the importance of preventive and early illness care and insufficient motivation to use them. ^^ "Under-utilization" and disapproved lifestyles are, in this view, individual failings which can perhaps be remedied by educational programs—an opportunity for professional intervention to teach the poor "correct" health habits and the importance of health services.

Attitudes do influence health behavior, but there is substantial evidence that when racial minorities and the poor have accessible and comprehensive medical services, their utilization rates are similar to those of the general population.' ""^ This evidence supports the argument that the lower use of such health services is the result of structural and functional problems in the services themselves rather than disfunctions in the potential users.

Victim blaming has been used not only to explain lower utilization by the poor but as a way of decreasing the use of health services by Medicaid recipients. In order to cut the escalating costs of Medicaid programs, the Nixon administration and conservative governors created barriers to the use of services. Setting limits on physician and dentist visits, especially for preventive care, and setting up bureaucratic delays for hospitalization (such as requiring physicians to obtain prior authorization before admitting a Medicaid patient to the hospital), the State made the "beneficiaries" of its programs pay for the market system's fiscal problems. ^^ Similarly, Medicare patients have been forced to pay higher deductibles and copayments in order to encourage them to spend less on their care. With the recent campaign of putting increasing responsibihty on the individual, the working and middle classes, as well as the poor, are being blamed for getting sick in the first place.

The prospects of national health insurance raised fears that further socializing the costs of medical care would only escalate the "technological imperative." Rather than question the decades-old policy of rationalizing the private medical market, health policy makers focus instead on the individuals who dare to succumb to the hazards of life in our society. Paying little more than lip service to the need to do something about the physical environment and social and economic conditions that are known to breed disease, they settle on an ideological position that is less

238 I Epilogue

threatening to the capitalist society of which they are important members. Technological medicine was proving a costly hardware system whose legitimacy has been undermined. Victim blaming is a cheap and ideologically

safe software alternative.

However, the victim-blaming strategy is generating opposition. Some public health officials have spoken out against this perspective. "For the vast majority of people in our society," argued C. Arden Miller as president of the American Public Health Association, "the life circumstances leading to poor health are not adopted as a matter of personal choice, but are thrust upon people by the social and economic circumstances into which they are born."\* Opposition is also developing in the labor movement to screening workers for at-risk health habits and "sensitivity" or "susceptibility" to occupational carcinogens, and to the barring of fertile women from hazardous jobs in the lead and chemical industries instead of eliminating the hazards from the workplace.""

An alternative to victim blaming and narrowly technological approaches to environmentally generated disease is an "ecological" strategy. In this model, health workers analyze the different factors that contribute to a health problem and, then, with the people affected develop social and political, as well as medical-technical, strategies for changing them."\* Individually oriented curative medicine is obviously needed because human beings are not perfectly adapted to any physical or social environment. But health care should do more than apply a band-aid to the wounds created by disharmony between people and environment. Much of this disharmony is the result of exploitation of the physical and social environment for profit, a process in which cancer caused by occupational and environmental pollution, high blood pressure due to stress, and excessively high death rates related to poverty and racism are considered "social costs" of production. However, political pressure can be developed to change these conditions and, ultimately, to reorganize production around social needs rather than the private accumulation of capital.

## CONCLUSION

American society is faced with a health system that is at once expensive and incapable of serving the important health needs of

### Epilogue I 239

the population. Despite many decades of efforts to make medicine more effective and improve its accessibility, the system seems to remain impervious to fundamental change. The reform efforts, however, are themselves fundamentally flawed.

From the early Rockefeller medical philanthropies to the opening of the federal treasury to the health sector, the major strategy for making medicine more effective has been biomedical research and the development of technological medicine. Technical advances have been very great, but the results have not been distributed equitably, coordinated rationally with needed primary care, or matched with support for improvements in the physical and social environments. Technique has also increasingly replaced personal caring and emotional support in doctor-patient relationships. As we have seen, these emphases have had only a limited positive impact on the health of the population. The persistence of such narrowly technical approaches is due to their usefulness to powerful classes and interest groups. For members of the corporate class, technological medicine has legitimized their economic and political dominance by diverting attention from the consequences of their control—that is, from such "social costs" as class inequalities, domination based on race or sex, occupational hazards, and environmental degradation. For the medical profession, the knowledge generated by medical science and the techniques of medical technology provided the basis for physicians' claims to a monopoly of authority over the practice of medicine. Over the last few decades medical technology has been the foundation of a whole new industry, an interest group that directly profits from the emphasis on technical approaches to health problems. Technological medicine has benefited all these groups, and they have, in turn, supported its expansion.

The Rockefeller philanthropies also began the long process of rationalizing medical care. This campaign has been joined by groups in and outside the health sector and has been increasingly supported by the State over the last several decades. The political power of the medical profession was strong enough to block early efforts at subordinating all elements of the system into a hierarchy of organizational authority. So pieces of the rationalizing strategy were implemented where there was least resistance. Voluntary health insurance programs

—private and later public ones—were developed mainly around hospital care, financing the

## 240 I Epilogue

expansion of high technology medicine with the hospital at its center. The rationalizing of the private medical market helped the growth of the capital-intensive medical commodity sector, which has a major stake in technological medicine. The private control of this market, the emphasis on medical technology, and the socializing of costs by third-party payers combined to make expenditures soar, compounding government fiscal problems and draining ever-increasing amounts of money from the economy.

Medicine's upper-class reformers, from Gates and his foundation colleagues to present-day officials of the State, have been unwilling to oppose the private market in its entirety, producing a profound contradiction in their struggles to rationalize medicine. They favored the development of the private market with legislative and financial support in lieu of nationalizing medical care. The present crisis is a result of this political-economic process. It was an inevitable outcome only in that those who shaped the system believed in, or at least accepted, the needs and constraints of capitalist economic and social relations. If Gates and subsequent foundation and government leaders in the field of medicine had been committed to making health care serve the needs of the majority population rather than the needs of capitalism and the interests of the corporate class, a different course would have been followed. Even today a comprehensive, centrally planned nationalized health service could effectively control cost and provide equal care for the whole population. Health care could be more effective in improving health if its research and action were directed at environmental conditions in about the same proportion that those conditions contribute to sickness and death.

But health policy makers cannot be counted on to make these fundamental changes. As members of the corporate class or identified with its interests, they believe, to paraphrase Charles Wilson's audacious aphorism, "what's good for business is good for America." Furthermore, the capitalist sector of medicine has grown rich and powerful, bringing the economic and political influence of insurance companies, banks, and industrial corporations into active support for retaining the private medical market. National health insurance is supported because it will further socialize the costs of medicine, but nationalizing medicine in a national health service is unacceptable to the powerful private

## Epilogue I 241

market forces and therefore is ignored by health policy makers. Instead of overhauling the medical system, they put the burden of controlling costs on people who have been afflicted with disease by restricting their access to services and demanding that they improve their health by changing their behavior.

However, even a national health service would not necessarily end medicine's role of legitimizing corporate capitalist society. It would, if anything, enable these ideological functions to compete less with the needs of the marketplace. Without the access problems that remain in the present market system, the "health administration," as Gates called medicine, could bring individual-focused, technical perspectives and methods to the health problems of the entire population.

Health care, potentially, has a great deal to offer. We rightfully expect it to prevent sickness, diagnose our ills, relieve our pains, and, when we are sick, return us to at least our usual level of functioning. If it were not distorted by its character as a commodity and by the ideological functions demanded of it, health care might well be developed as we wish it would. It is possible to make a health care system that effectively serves the health needs of the majority classes rather than the economic and political interests of its providers and the upper classes. It is doubtful, however, that such a health care system can be realized in a capitalist society, committed as it must be to maintaining the primacy of capital accumulation. Nevertheless, the struggle for that new health system may contribute to the larger struggle for a new, more just economic and social order.

## CHAPTER 1

1. The best biography of Carnegie is Joseph Frazier Wall, *Andrew Carnegie* (New York: Oxford University Press, 1970).
2. Of the numerous biographies of Rockefeller, I have relied mainly on Allan Nevins, *John D. Rockefeller: The Heroic Age of American Enterprise*, 2 vols. (New York: Charles Scribner's Sons, 1940); and Peter Collier and David Horowitz, *The Rockefellers: An American Dynasty* (New York: Holt, Rinehart and Winston, 1976), pp. 1-73. The former book is the most detailed, but the latter puts his life into perspective and examines it somewhat critically.
3. On the changing class structure resulting from industrialization during the nineteenth century, see William Appleman Williams, *The Contours of American History* (Cleveland: World Publishing Co., 1961); and Robert H. Wiebe, *The Search for Order, 1877-1920* (New York: Hill and Wang, 1967).
4. Williams, *Contours*, pp. 315, 333. See also Richard O. Boyer and Herbert M. Morais, *Labor's Untold Story*, 3rd ed. (New York: United Electrical, Radio, and Machine Workers of America, 1972).
5. John D. Rockefeller, *Random Reminiscences of Men and Events* (New York: Doubleday, Page and Co., 1909), pp. 141<sup>2</sup>.
6. *Ibid.*, p. 158.
7. Quoted in Edward Chase Kirkland, *Dream and Thought in the Business Community, 1860-1900* (Chicago: Quadrangle Books, 1964; originally published 1956), p. 165.
8. Hanna quote from M. A. Hanna to J. D. Rockefeller, Sept. 8, 1885, Rockefeller Family Archives, record group 1. On Hanna's role in building political capitalism, see Williams, pp. 349, 360-62, 381. On the development of close ties between the executive branch and private industry and finance, see Gabriel Kolko, *The Triumph of Conservatism: A Reinterpretation of American History, 1900-1916* (Chicago: Quadrangle Books, 1967; originally published 1963); and on the further development of this corporate liberal program of reforming government to serve the needs of monopolistic industry, see James Weinstein, *The Corporate Ideal in the Liberal State, 1900-1918* (Boston: Beacon Press, 1968).
9. Correspondence between Hanna and Rockefeller, 1885 to 1892, Rockefeller Family Archives, record group 1.

## Notes to Pages 20-31 I 245

10. For a brief view of how the wealthiest Americans lived in this period and complaints and defenses regarding their ostentation, see Kirkland, *Dream and Thought*, chap. 2.
11. For an uncritical historical survey of philanthropy in the United States, see Robert H. Bremner, *American Philanthropy* (Chicago: University of Chicago Press, 1960); the Mather and Frankhn quotes are from pp. 12-17.
12. *Ibid.*, pp. 96-99.

13. Richard Hofstadter, *Social Darwinism in American Thought* (Boston: Beacon Press, 1955); quote from Spencer on p. 41.
14. See, for example, any of the Proceedings of the National Conference of Charities and Correction for this period; Amos G. Warner, *American Charities*, rev. ed. (New York: Thomas Y. Crowell, 1919; originally published 1894); and Frank D. Watson, *The Charity Organization Movement in the United States: A Study in American Philanthropy* (New York: Macmillan, 1922)—all representative of this movement.
15. Edward T. Devine, "The Dominant Note of the Modern Philanthropy," *Proceedings of the National Conference of Charities and Correction* (1906), p. 3.
16. Warner, *American Charities*, pp. 28, 46-47.
17. Anthony Piatt, *The Child Savers: The Invention of Delinquency* (Chicago: University of Chicago Press, 1969), pp. 35-36.
18. Quoted in Howard S. Miller, *Dollars for Research: Science and Its Patrons in Nineteenth-Century America* (Seattle: University of Washington Press, 1970), pp. 159-60.
19. Jane Addams, *Twenty Years at Hull-House* (New York: Signet/Macmillan, 1961; originally published 1910), p. 299; quoted in Piatt, *Child Savers*, pp. 96-97.
20. On the development of public schools, see Michael B. Katz, *Class, Bureaucracy, and Schools—The Illusion of Educational Change in America* (New York: Praeger Publishers, 1971); and Joel H. Spring, *Education and the Rise of the Corporate State* (Boston: Beacon Press, 1972).
21. Hamilton A. Hill, *Memoir of Abbott Lawrence* (Boston: "Printed for Private Distribution," 1883); p. 108.
22. *Ibid.*, p. 109.
23. See Harry Braverman, *Labor and Monopoly Capital: The Degradation of Work in the Twentieth Century* (New York: Monthly Review Press, 1974), pp. 125-37.
24. Miller, *Dollars for Research*, p. 7.
25. *Ibid.*, pp. 3-8.
26. Merle Curti and Roderick Nash, *Philanthropy in the Shaping of American Higher Education* (New Brunswick, N.J.: Rutgers University Press, 1965), pp. 70-72.
27. *Ibid.*, pp. 69-70. See also Frederick Rudolph, *The American College and University: A History* (New York: Vintage Books, 1965), pp. 222-31.
28. Curti and Nash, *Philanthropy*, pp. 64-65.
29. Elbert Vaughan Wills, *The Growth of American Higher Education—Liberal, Professional, and Technical* (Phila.: Dorrance and Co., 1936), p. 147.
30. Curti and Nash, *Philanthropy*, p. 135.
31. *Ibid.*, pp. 64-65, 112-14.
32. "Wealth," *North American Review*, 148 (June 1889), 653-64; and 149 (Dec. 1889), 682-98; reprinted in Andrew Carnegie, *Gospel of Wealth and Other Timely Essays* (Cambridge, Mass.: Harvard University Press, 1962), pp. 14-49.

34. For gifts given by Carnegie in his lifetime and bequeathed by him at his death, see A Manual of the Public Benefactions of Andrew Carnegie (Washington, D.C.: Carnegie Endowment for International Peace, 1919).
35. Wall, Carnegie, pp. 806-12.
36. Manual of the Public Benefactions.
37. The account of Rockefeller's life is taken from Nevins, Rockefeller; and Collier and Horowitz, Rockefellers, pp. 1-73.
38. Quoted in Nevins, Rockefeller, II, 177.
39. Quoted in Collier and Horowitz, Rockefellers, p. 48.
40. A detailed and readable account of the development of the University of Chicago is found in Nevins, Rockefeller, II, 191-227.
41. Ibid., 213-14.
42. Ibid., 213-14, 627, 266.
43. Ibid., 269, 427; and Collier and Horowitz, Rockefellers, pp. 45-47.
44. Gates describes the meeting with Rockefeller in his Autobiography. At the time this book was researched and written. Gates' autobiography was an unpublished typescript in the Rockefeller Foundation Archives. It has since been published as Chapters in My Life (New York: Free Press, 1977). I continue to use the citation "Gates, Autobiography," referring to the typescript pages. Gates' meeting with Rockefeller is also recounted in detail in Nevins, Rockefeller, II, 266-69.
45. Gates, Autobiography, p. 342; and quoted in Nevins, Rockefeller, II, 268.
46. Nevins, Rockefeller, II, 268.
47. Gates, Autobiography, pp. 342-45.
48. Rockefeller, Random Reminiscences, p. 116; Allan Nevins, A Study in Power: John D. Rockefeller, Industrialist and Philanthropist (New York: Charles Scribner's Sons, 1953), II, 197; and Gates, Autobiography, p. 366.
49. Nevins, Rockefeller, II, 274-81; and Rockefeller, Random Reminiscences, p. 117.
50. Nevins, Rockefeller, II, 279-81.
51. Ibid., 274; and Gates, Autobiography.
52. The only account of Gates' early life is in his Autobiography; it is summarized with quotes in Nevins, Rockefeller, II, 269-72.
53. Nevins, Rockefeller, II, 272-73.
54. Memo, April 20, 1891, GEB files. Rockefeller Foundation Archives.
55. Nevins, Rockefeller, II, 282-85; and Gates, Autobiography, p. 375.
56. Gates, Autobiography, pp. 310-15; F. T. Gates to J. D. Rockefeller, June 12, 1916, and E. N. Gary to J. D. Rockefeller, May 4, 1909, both in Rockefeller Family Archives, record group 2.
57. Quoted in B. C. Forbes, "How John D. Rockefeller Became America's Foremost Organizer and Richest Man,"

Leslie's, Sept. 29, 1917. See also Rockefeller, *Random Reminiscences*, p. 117.

58. Details of Junior's life are available in Collier and Horowitz, *Rockefellers*, pp. 75-178. The period of his entry to his father's office is described on pp. 87-92.

59. Gates, *Autobiography*, pp. 517-18; Nevins, *Rockefeller*, II, 289.

60. Raymond Fosdick, John D. Rockefeller, Jr., *A Portrait* (New York: Harper and Bros., 1956), p. Ill; Nevins, *Rockefeller*, II, 290.

61. Raymond Fosdick, *The Story of the Rockefeller Foundation* (New York: Harper and Bros., 1952), p. 2.

62. For the authorized and largely uncritical histories of the Rockefeller philanthropies, see Fosdick's history of the Rockefeller Foundation, cited above, and his *Adventure in Giving: The Story of the General Education Board* (New York: Harper and Row, 1962); George W. Comer, *A History of the Rockefeller*

Notes to Pages 43-47 I 247

Institute—1901-1953 (New York: Rockefeller Institute Press, 1964); and Greer Williams, *The Plague Killers* (New York: Charles Scribner's Sons, 1969), about the worldwide public health programs. For more critical views, see Harry Cleaver, Jr., "The Origins of the Green Revolution," unpublished doctoral dissertation, Stanford University, 1975; E. Richard Brown, "Public Health in Imperialism: Early Rockefeller Programs at Home and Abroad," *American Journal of Public Health*, 66 (1976), 897-903; Collier and Horowitz, *Rockefellers*; and the following chapters in this book.

63. Quoted in Nevins, *Rockefeller*, II, 291.

64. Rockefeller, *Random Reminiscences*, pp. 159-60.

65. See F. Emerson Andrews, *Philanthropic Giving* (New York: Russell Sage Foundation, 1950); Warren Weaver, *U.S. Philanthropic Foundations—Their History, Structure, Management, and Record* (New York: Harper and Row, 1967); and Bremner, *American Philanthropy*.

66. See Franklin Parker, *George Peabody, A Biography* (Nashville: Vanderbilt University Press, 1971), pp. 160-67, on the founding of the Peabody Fund; and see Jessie Pearl Rice, *J. L. M. Curry — Southerner, Statesman, and Educator* (New York: Columbia University Press, 1949), pp. 159-75, on Curry's role in Southern education funds.

67. Louis R. Harlan, *Separate and Unequal: Public School Campaigns and Racism in the Southern Seaboard States, 1901-1915* (Chapel Hill: University of North Carolina Press, 1958), discusses the Southern Education Board, pp. 75-101. Some of the important contributions to the board's total income, \$400,000 in the thirteen years of its existence, came from George Foster Peabody, Andrew Carnegie, Rockefeller's General Education Board, Frank R. Chambers of New York, the Russell Sage Foundation, and Robert C. Ogden.

68. Hugh C. Bailey, *Liberalism in the New South — Southern Social Reformers and the Progressive Movement* (Coral Gables, Fla.: University of Miami Press, 1969), p. 138.

69. Harlan, *Separate and Unequal*, pp. 75-101; Bailey, *Liberalism*, pp. 75-76; Lawrence A. Cremin, *The Transformation of the School — Progressivism in American Education, 1876-1957* (New York: Knopf, 1961), pp. 23-57. Washington was financially supported by Northern businessmen and Southern liberals; he was hired as an agent of the SEB though he was never allowed to attend a board meeting. More assertive black leaders denounced the Hampton model of industrial schooling for blacks. W. E. B. DuBois pointed out that exclusive support of industrial schooling emphasized blacks' duties and put their rights into the background. "Take the eyes of these millions off the stars and fasten them in the soil," he mockingly told a Hampton audience, and let their dreams be of "corn bread and molasses." DuBois, *The Education of Black People*, ed. H. Aptheker (Amherst: University of Massachusetts Press, 1973), p. 9.

70. Quoted in Cleaver, "Origins of the Green Revolution."

71. Fosdick, *Adventure in Giving*, pp. 10-11. SEB member William H. Baldwin, president of the Long Island Railroad, argued that blacks "will willingly fill the more menial positions, and do the heavy work, at less wages," leaving to whites "the more expert labor," Harlan, *Separate and Unequal*, p. 78, 75-101.

72. Fosdick, *Rockefeller, Jr.*, pp. 117-18.

73. Memorandum in Rockefeller Family Archives, record group 2.

74. Copy of press release in Rockefeller Family Archives, record group 2.

75. Harlan, *Separate and Unequal*, pp. 75-101; Frissell quoted on p. 86.

76. Fosdick, *Adventure in Giving*, pp. 10-11; Buttrick to Gates, Oct. 14, 1904; confidential report of Jerome D. Greene, Wallace Buttrick, and Abraham

Embree to George Vincent, May 7, 1928, GEB files; memos by Edwin Embree about 1932, Edwin Embree papers—all Rockefeller Foundation Archives.

93. Gates, memo to himself, Nov. 20, 1911, Rockefeller Family Archives, record group 2.

Notes to Pages 56-64 I 249

94. Rockefeller, Jr., to Rockefeller, Dec. 31, 1906, Rockefeller Family Archives, record group 2.

95. Gates, memo to GEB, Nov. 1911, Rockefeller Family Archives, record group 2.

96. University of Chicago relationship described and letter quoted in Nevins, *Rockefeller*, II, 230-31, 246, 265-M, 627.

97. Gates to George Foster Peabody, March 20, 1912, Rockefeller Family Archives, record group 2; *Annual Report of the General Education Board, 1924-1925*, p. 5; A. Flexner, *Autobiography*, p. 209.

98. Williams, *Contours*, pp. 352-53. An illustration of the profitable use of managers comes from Carnegie's career. In 1873 Carnegie hired Captain William Jones to run his steel mill, and it was largely Jones who kept the company's costs below and its profits above those of its competitors. Jones introduced technical innovations that he personally designed, and he maintained relatively stable relations with his workers despite the intolerably exploitative wages and working conditions he and the company imposed on them. He worked the men under him twelve hours a day, seven days a week in mills where temperatures frequently topped 100°, but he also understood the necessity of setting some floor below which wages would not be pushed in order to keep his workers—a position that Carnegie had difficulty accepting. On Jones' role, see Wall, *Carnegie*, pp. 314-16, 328-29, 344<sup>5</sup>.

99. A. Flexner, *Autobiography*, p. 109.

## CHAPTER 2

1. Joseph E. Kett, *The Formation of the American Medical Profession—The Role of Institutions, 1780-1860* (New Haven: Yale University Press, 1968), pp. 9-10.

2. William G. Rothstein, *American Physicians in the Nineteenth Century* (Baltimore: Johns Hopkins University Press, 1972), pp. 35-36.

3. A Maryland physician named Alexander Hamilton complained of the empirics he found in his travels through the colonies in 1744. "A great many of them take the care of a family for the value of a Dutch dollar a year, which makes the practice of physick a mean thing, and unworthy of the application of a gentleman." Quoted in Rothstein, *American Physicians*, p. 35.

4. L. H. Butterfield, ed., *Letters of Benjamin Rush* (Princeton: Princeton University Press, 1951), vol. 2, 661.

5. On lay healers, see Barbara Ehrenreich and Deirdre English, *Witches, Mid-wives, and Nurses: A History of Women Healers* (Old Westbury, N.Y.: The Feminist Press, 1973); and Kett, *Formation*.

6. For a detailed description and discussion of regular medical practice in the first half of the nineteenth century, see Rothstein, *American Physicians*, pp. 41-62.

7. On the Popular Health Movement and some of its component groups, see Richard H. Shryock, "Sylvester Graham and the Popular Health Movement, 1830-1870," in Shryock, *Medicine in America, Historical Essays* (Baltimore: Johns Hopkins Press, 1966), pp. 111-25; and Ehrenreich and English, *Witches*, pp. 22-25. On licensing, see Shryock, *Medical Licensing in America, 1650-1965* (Baltimore: Johns Hopkins Press, 1967).

8. See Rothstein, *American Physicians*, pp. 152-74; and Harris L. Coulter, *Divided Legacy*, 3 vols. (Washington, D.C.: McGrath Publishing Co., 1973).

9. Rosemary Stevens, *American Medicine and the Public Interest* (New Haven: Yale University Press, 1971), p. 24.

10. Rothstein, *American Physicians*, p. 95.

## 252 I Notes to Pages 86-94

61. Bryan, it should be noted, argued not from the needs of the working class nor even humanitarian grounds. An early advocate of what has become known as the "equal opportunity" doctrine, his argument for including the poorer classes in medicine came from his belief that "it is certain the only hope of this country for salvation from anarchy is in keeping the doors of higher opportunity open to the poorest." From Association of American Medical Colleges, *Proceedings of the 18th Annual Meeting*, Cleveland, March 16-17, 1908, p. 37.

Morison, ed., *The Development of Harvard University Since the Inauguration of President Eliot, 1869-1929* (Cambridge, Mass.: Harvard University Press, 1930), pp. 558-62. See also Frank BilUngs, "Medical Education in the United States," *President's Address*, JAMA, 40 (1903), 1271-76, for a brief summary of the organization's position on this and other planks in the reform platform.
52. Pritchett to Bevan, Nov. 4, 1909, correspondence with AMA, Carnegie Foundation files.
53. Pritchett to Bevan, June 18, 1910, and Bevan to Pritchett, Dec. 17, 1910, correspondence with AMA, Carnegie Foundation files. The reviews of Flex-ner's report were mixed. The *New York Times* (June 12, 1910) praised the report but called it "slightly contentious and unnecessarily irritating." The *Chicago Daily Tribune* (June 6 and 7, 1910) observed that schools that were given favorable evaluations by Flexner praised his report while those that were condemned by Flexner denied the validity of his report. The same paper noted that "the recommendations lean toward depriving the poor man of an education." *American Medicine* [5 (1910), 441-42] criticized the report for saying little that was not already known in the medical profession and for disregarding "the very evident progress of the past ten to fifteen years." The journal wishfully asserted that "the day of the small, comparatively inconsequential medical college is by no means passed." The *New York State Journal of Medicine* [10 (1910), 483-84] criticized the Carnegie Foundation for meddling in the internal affairs of universities and colleges and attacked the Flexner report's "wholesale and intemperate criticisms" of American medical schools. The homeopathic medical sect, of course, joined the chorus of criticism" from

#### Notes to Pages 153-156 I 259

- wounded professional interests; see the *Homeopathic Recorder*, 25 (1910), 241-43, 337-39, 413, 416; and 26 (1911), 15-16. The JAMA [54 (1910), 1949] equally predictably praised the report and voiced the leadership's fervent hope that "this report will call the attention of men of wealth to the need of endowments for medical education."
54. Pritchett to N. P. Colwell, Dec. 29, 1913, correspondence with AMA, Carnegie Foundation files.
55. Pritchett accused the council of giving greater leniency to Baylor University's medical school than to Meharry. Pritchett to Colwell, April 3, 1918, and May 2, 1921, and other letters between Pritchett and Bevan from 1918 to 1922, correspondence with AMA, Carnegie Foundation files. By 1917 Pritchett was so disenchanted with the council, and presumably ashamed of his own gullibility a decade earlier, that he rejected out of hand a request by Bevan that the foundation undertake a new study designed to discredit "medical cults." Bevan included in this term "everything that masquerades as branches or cults in the art of healing outside of regular scientific medicine." Bevan to Pritchett, March 23, 1917; Pritchett to Bevan, April 3, 1917; and Clyde Furst, secretary of the Carnegie Foundation, to N. P. Colwell, Dec. 1, 1917; all in correspondence with AMA, Carnegie Foundation files.
56. A. Flexner, *Autobiography*, p. 165; Saul Jarcho, "Medical Education in the United States, 1910-1956," *Journal of the Mount Sinai Hospital*, 26 (1959), 339<sup>o</sup>.
57. A. Flexner, *Medical Education*, pp. 10-11.
58. On the impact of the Flexner report see Stevens, *American Medicine*, pp. 68-69; Rothstein, *American Physicians*, pp. 292-94; Markowitz and Rosner, "Doctors," 101; Robert P. Hudson, "Abraham Flexner in

Perspective: American Medical Education, 1865-1910," *Bulletin of the History of Medicine*, 46 (1972), 545-61; H. David Banta, "Abraham Flexner—A Reappraisal," *Social Science and Medicine*, 5 (1971), 655-61; and Carleton B. Chapman, "'The Flexner Report by Abraham Flexner,'" *Daedalus*, 103 (Winter 1974), 105-17. For a thorough discussion of the Flexner report in its historical context, see Howard S. Berhner, "A Larger Perspective on the Flexner Report," *International Journal of Health Services*, 5 (1975), 573-92.

59. Herbert M. Morals, *The History of the Negro in Medicine* (New York: Publishers Co., for Association for the Study of Negro Life and History, 1967), pp. 86, 100. De facto segregation is still the reality in the North as well as in the South. Black physicians serve a nearly all-black clientele while few white doctors locate their offices in poor or racial minority areas. Cf. Lois C. Gray, "The Geographic and Functional Distribution of Black Physicians: Some Research and Policy Considerations," *American Journal of Public Health*, 67 (1977), 519-26; and Eva J. Salber et al., "Access to Health Care in a Southern Rural Community," *Medical Care*, 14 (1976), 971-«6.

60. Quoted in John F. Fulton, *Harvey Gushing, A Biography* (Springfield, 111.: Charles C. Thomas, 1946), p. 379. Bevan's memor' did not serve him well (or perhaps it served him better than it served truth). He remembered there being twenty-two homeopathic schools and twelve eclectic schools "running at the time." The council's own figures indicate that there were twenty-two homeopathic schools in 1900 and never more than nine eclectic schools at any one time (although a total of thirty-two had been started during the previous century).

See also Forward Plan for Health, FY 1978-82, p. 97. Other researchers have concluded that some of the improvements in cancer survival rates with most kinds of therapy are due to deficient tumor registry methods: Ralph D. Reynolds et al., "Survival in Lung Cancer," *Western Journal of Medicine*, 121 (1977), 190-94. There have been some notable improvements in detection and treatment of cancer (particularly for Hodgkin's disease and childhood leukemia), but these have had very little impact on overall cancer mortality and, of course, no impact on the incidence of cancer.

Zinsser, Hans, 227

"No one can or should ignore this book. It's an eloquent, well-documented damning appraisal of the historical marriage between medicine and capitalism and its impact on shaping the kind of health care system we have today."

—*Washington Post Book World*

"One need not agree with the thesis, although there is much logic to it. The case is well-researched and presented in an interesting manner. This book should appeal to a wide medical audience and others concerned with the evolution of change in the health-care sector." —*New England Journal of Medicine*

"The last ten years have seen increasing emphasis on the analysis of the American health care system in terms of the struggle between entrepreneurial private-practice forces and forces making for increased bureaucratization . . . Relying heavily on the papers of executives of the Rockefeller and other philanthropies, [Brown] focuses on the efforts of physicians and corporate interests to promote scientific medicine and modern medical education in the late 19th and early 20th centuries. . . . An important book." —*Choice*

"The events surrounding the development of scientific medicine and medical education in the period just before and after the Flexner report of 1910 have certainly been studied and overstudied by medical historians. It is to the inestimable credit of Brown that he is able to cover much of the same territory and yet reinterpret it in a totally original manner. . . . He has set the terms for future scholarship for years to come."

—*Bulletin of the History of Medicine*

"A fine piece of work . . . an important addition to a growing literature which questions the orthodox and established explanations of medicine and medical professionalism." —*Vincente Navarro, M.D., The Johns Hopkins University*

"An outstanding contribution to the literature on the political economy of health care . . . integrating material from a variety of disciplines—economics, sociology, political science, epidemiology, history, and social policy . . . sets a standard for progressive writers on health care."

—*John McKinlay, Boston University*

"Brown has written the definitive work on the development of the modern, scientific, technological paradigm of American medicine. . . . It is crucial that this book be read by consumers of health care." —*Antioch Review*

*To my brother, Dr. Bart Chernow,  
who pulled me back, at the last moment, from the brink,  
and to the lovely Valerie*

Two men have been supreme in creating the modern world: Rockefeller and Bismarck. One in economics, the other in politics, refuted the liberal dream of universal happiness through individual competition, substituting monopoly and the corporate state, or at least movements toward them.

—*BERTRAND RUSSELL Freedom Versus Organization, 1814 to 1914*

Something in the nature of J. D. Rockefeller had to occur in America, and it is all to the good of the world that he was tight-lipped, consistent and amazingly free from vulgar vanity, sensuality and quarrelsomeness. His cold persistence and ruthlessness may arouse something like horror, but for all that he was a forward-moving force, a constructive power.

—*H. G. WELLS The Work, Wealth and Happiness of Mankind*

When history passes its final verdict on John D. Rockefeller, it may well be that his endowment of research will be recognized as a milestone in the progress of the race. . . . Science today owes as much to the rich men of generosity and discernment as the art of the Renaissance owes to the patronage of Popes and Princes. Of these rich men, John D. Rockefeller is the supreme type.

—*WINSTON CHURCHILL St. Louis Post-Dispatch, July 8, 1936*

Rockefeller, you know, is reputed the richest man in the world, and he certainly is the most powerfully suggestive personality I have ever seen. A man 10 stories deep, and to me quite unfathomable. Physionomie de Pierrot (not a speck of hair on head or face) flexible, cunning, quakerish, superficially suggestive of naught but goodness and conscientiousness, yet accused of being the greatest villain in business whom our country has produced.

—*WILLIAM JAMES in a letter to Henry James January 29, 1904*

*A New York Times Book Review* Editors' Choice  
*A Business Week* Best Business Book of the Year  
A *Time* Magazine Book of the Year  
An *Economist* Best Biography of the Year

"Splendid . . . a blue chip biography." —*Newsweek*

"Ron Chernow's portrait of Rockefeller, an eccentric on a heroic scale as well as a genius, is convincing. . . . This is the best biography of the man so far." —The Washington Post Book World

"What a story! An outstanding business biography." —*The New York Observer*

"A triumph of research, understanding and elegant writing." —*Houston Chronicle*

"With uncanny timing, Ron Chernow has written a captivating biography of one of the most famous men in American business history. . . . Business needs more books like Titan. —Newsday

"Good biographies are hard to find and great ones even rarer. . . . A thoughtful and balanced approach to one of the most significant and controversial lives of the past century . . . spellbinding." —*The Seattle Times*

"A masterful synthesis of research and writing . . . an extraordinary achievement in biography." —The New Republic

"It's a thrill to read a biography as good as this one! Ron Chernow's *Titan* is a triumph, a brilliant, riveting, and monumental portrait of a fascinating human being and his age." —Robert A. Caro

"Chernow has written the definitive biographies of two other legendary financial dynasties. . . . Now, with his Rockefeller biography, he has completed an extraordinary trilogy about the towering figures of twentieth century commerce." —*Vanity Fair*

"By the time Chernow is finished, the old guy seems utterly human . . . and oddly appealing. . . . A timeless parable of our civilization." —*San Francisco Chronicle*

"You can read the book as a sympathetic portrait of a complex man, a business history, a legal battle, or simply as a great yarn." —*Business Week*

"It is hard to imagine a better biography of Rockefeller being written. . . . An enthralling biography of an enthralling person." —*Chicago Tribune*

"A monumental and mesmerizing biography . . . a fascinating yarn, capturing a man who insisted he could serve God and Mammon." —*The San Diego Union-Tribune*

"A richly textured and engagingly lively portrait. . . . It is a remarkable story and Chernow tells it with confidence and clarity . . . probably the last word on a genuine titan." —*Daily News*

"Rockefeller lived one of the great American lives, and Chernow has provided him with one of the great American biographies." —*The Sunday Times* (London)

"In this splendid biography, justice is finally done to [Rockefeller's] memory." —The Plain Dealer

"Stunning. . . . Mr. Chernow has confirmed his reputation as a great business historian." —The Financial Times

"A worthy biography of a truly titanic figure." — *The Economist*

"Chernow's detailed picture of this 'implausible blend of sin and sanctity' is a scrupulously balanced, frequently fascinating and humanizing portrait of a figure of seemingly superhuman energy and ambition." — *People*

"Altogether splendid." —*American Heritage*

"Sweeping. . . . Chernow lays out the [Rockefeller] conundrum superbly, delineating the forces that shaped this man and the ways he responded to them." —*USA Today*

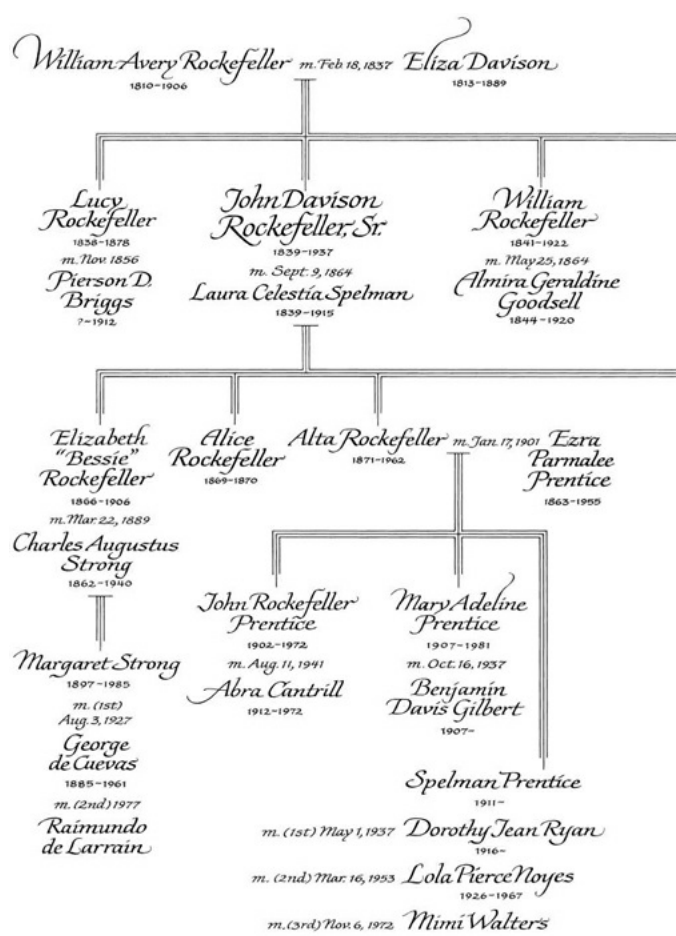

"[Ron Chernow is] America's best business biographer." — *Fortune*

"Ron Chernow's splendid biography of John D. Rockefeller Sr. will stand out as one of the best books of the year. He again proves himself remarkably facile with a huge amount of information. . . . I'd be hard pressed to find a page that isn't interesting. . . . Chernow succeeds brilliantly." — *Detroit Free Press*

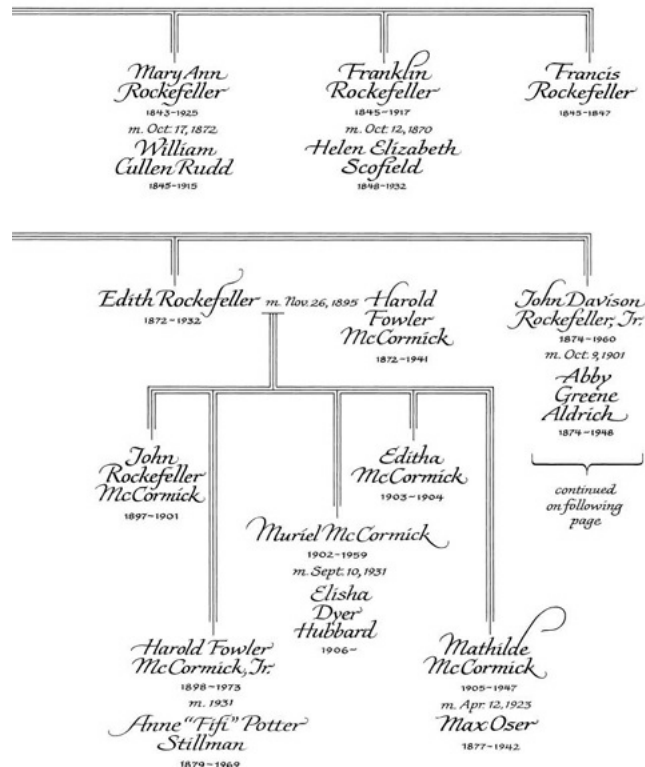

"Powerful, meticulously researched. . . . Chernow encompasses better than any writer before him the powerful contradictions and polarities in

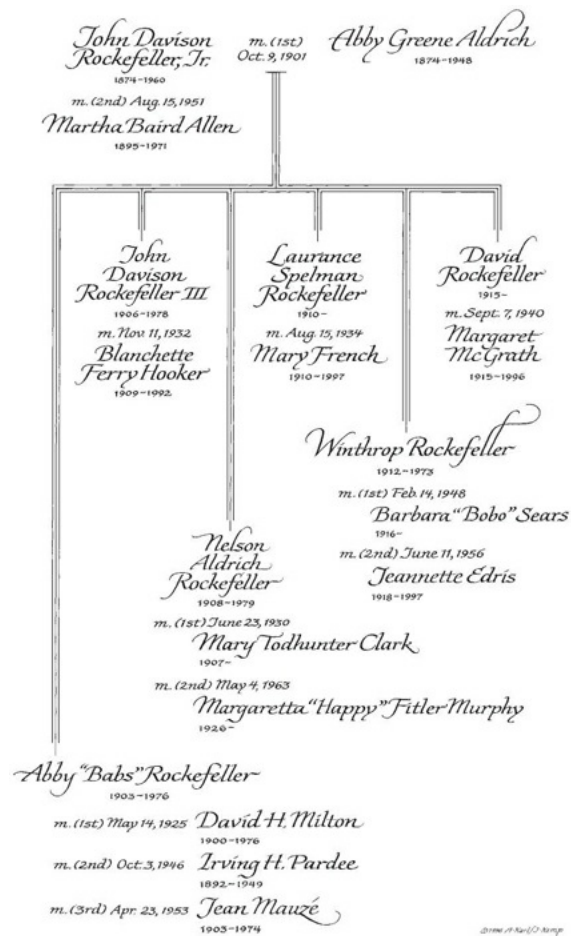

Rockefeller's character. *Titan* . . . is one of the richest and most rewarding biographies of an American magnate." —*St. Petersburg Times*

"[No biographer] has been as skilled, or as exhaustive, as Ron Chernow." —The Philadelphia Inquirer

DESCENDANTS OF  
*William & Eliza Rockefeller*

## FOREWORD

The life of John Davison Rockefeller, Sr., was marked to an exceptional degree by silence, mystery, and evasion. Even though he presided over the largest business and philanthropic enterprises of his day, he has remained an elusive figure. A master of disguises, he spent his life camouflaged behind multiple personae and shrouded beneath layers of mythology. Hence, he lingers in our national psyche as a series of disconnected images, ranging from the rapacious creator of Standard Oil, brilliant but bloodless, to the wizened old codger dispensing dimes and canned speeches for newsreel cameras. It is often hard to piece together the varied images into a coherent picture.

This has not been for lack of trying. Earlier in the century, Rockefeller inspired more prose than any other private citizen in America, with books about him tumbling forth at a rate of nearly one per year. As he was the most famous American of his day, his statements and actions were reported and analyzed minutely in the press. Yet even in his heyday of popular interest, he could seem maddeningly opaque, with much of his life unfolding behind the walls of his estates and the frosted-glass doors of his office.

Rockefeller often seems to be missing from his own biographies, flitting through them like a ghostly, disembodied figure. For the principal muckrakers, such as Henry Demarest Lloyd and Ida Tarbell, he served as shorthand for the Standard Oil trust, his personality submerged in its machinations. Even in the two-volume biography by Allan Nevins, who strove to vindicate Rockefeller's reputation, Rockefeller vanishes for pages at a time amid a swirl of charges and countercharges. The attention paid to the depredations of Standard Oil has tended to overshadow everything else about Rockefeller's life. H. G. Wells defended this biographical approach: "The life history of Rockefeller is the history of the trust; he made it, and equally it made him . . . so that apart from its story it seems hardly necessary to detail his personal life in chronological order."<sup>1</sup> So steadfastly have biographers clung to this dated view that we still lack an account of our foremost nineteenth-century industrialist that explores his inner and outer worlds and synthesizes them into a fully rounded portrait.

For all the ink provoked by Rockefeller, his biographies have been marred by a numbing repetition. Whatever their political slant, they have, on the whole, followed the same chronology, raked over the same disputes about his business methods, rehashed the same stale anecdotes. One has the impression of sitting through the same play over and over again, albeit from slightly different seats in the theater. Some of this derives from our shifting conception of biography. With the exception of *John D.*, a slender volume by David Freeman Hawke published in 1980, the Rockefeller biographies were all published before mid-century and betray a Victorian reticence about private matters. Whatever their merits as business reportage, they betray minimal post-Freudian curiosity. They touch only glancingly, for instance, on the story of Rockefeller's father, a bigamist and snake-oil salesman, who so indelibly shaped his son's life. Even the exhaustive Nevins showed scant interest in Rockefeller's marriage or his three daughters. The feminist concerns of our own day have recently produced two books—Bernice Kert's *Abby Aldrich Rockefeller* and Clarice Stasz's *The Rockefeller Women*—that have begun to pry open this hermetically sealed family world. Rockefeller's social life beyond the office—his friendships, hobbies, sports, et cetera—has suffered from equally conspicuous neglect. Other matters that warrant investigation include Rockefeller's political views and theory of trusts, his attitude toward public relations, his stewardship of his investments beyond Standard Oil, his transfer of money to his children and his dynastic ambitions, his persistent fascination with medicine, and the imprint he left upon the many philanthropies he endowed. There has also been a remarkable lack of curiosity about the forty-odd years that he spent in retirement, with some biographers omitting those decades altogether. Yet it was during those decades that John D. Rockefeller, Jr., both perpetuated and radically modified his father's legacy, a subject to which I devote considerable attention.

When Random House proposed that I write the first full-length biography of Rockefeller since Allan Nevins's in the 1950s, I frankly balked, convinced that the subject had been exhausted by writers too eager to capitalize on his fame. How could one write about a man who made such a fetish of secrecy? In the existing literature, he came across as a gifted automaton at best, a malevolent machine at worst. I couldn't tell whether he was a hollow man, deadened by the pursuit of money, or someone of great depth and force but with eerie self-control. If the former was true, I would respectfully decline; in the unlikely case that the latter proved true—well, then I was intrigued.

To settle the matter, I spent a day at the Rockefeller Archive Center in Sleepy Hollow, New York, the repository of millions of family documents. When I told the curators of my misgivings and explained that I couldn't write about Rockefeller unless I heard his inner voice—the "music of his mind," as I phrased it—they brought me the transcript of an interview privately conducted with Rockefeller between 1917 and 1920. It was done by William O. Inglis, a New York newspaperman who questioned Rockefeller for an authorized biography that was never published. As I pored over this seventeen-hundred-page verbatim transcript, I was astonished: Rockefeller, stereotyped as taciturn and empty, turned out to be analytic, articulate, even fiery; he was also quite funny, with a dry midwestern wit. This wasn't someone I had encountered in any biography. When I returned home, I told Ann Godoff, my editor at Random House, that I was now eager to do the book.

To delve into the voluminous Rockefeller papers is to excavate a lost continent. Yet even with such massive documentation, I had the frustrating sense, early in my research, that I was confronting a sphinx. Rockefeller trained himself to reveal as little as possible, even in private letters, which he wrote as if they might someday fall into the hands of a prosecuting attorney. With his instinctive secrecy, he excelled at employing strange euphemisms and elliptical phrasing. For this reason, the twenty thousand pages of letters that Rockefeller received from his more outspoken business associates proved a windfall of historic proportions. Written as early as 1877, seven years after Standard Oil's formation, they provide a vivid portrait of the company's byzantine dealings with oil producers, refiners, transporters, and marketers, as well as railroad chieftains, bank directors, and political bosses. This panorama of greed and guile should startle even the most jaundiced students of the Gilded Age. I was also extremely fortunate to have access to the papers of five distinguished predecessors, all of whom left behind complete research files. I combed through the abundant papers of Ida Tarbell at the Drake Well Museum in Titusville, Pennsylvania, Henry Demarest Lloyd at the State Historical Society of Wisconsin, and Allan Nevins at Columbia University, in addition to those of William O. Inglis and Raymond B. Fosdick (the author of the official biography of John D. Rockefeller, Jr.) at the Rockefeller Archive Center. These collections contain a vast number of contemporary interviews and other materials that were only partly used by their authors.

Like many moguls of the Gilded Age, Rockefeller was either glorified by partisan biographers, who could see no wrong, or vilified by vitriolic critics, who could see no right. This one-sidedness has been especially harmful in the case of Rockefeller, who was such an implausible blend of sin and sanctity. I have tried to operate in the large space between polemics and apologetics, motivated by the belief that Rockefeller's life was of a piece and that the pious, Bible-thumping Rockefeller wasn't simply a cunning façade for the corporate pirate. The religious and acquisitive sides of his nature were intimately related. For this reason, I have stressed his evangelical Baptism as the passkey that unlocks many mysteries of his life. Those who would like to see Rockefeller either demonized or canonized in these pages will be disappointed.

This seems an auspicious time to resurrect Rockefeller's ghost. With the fall of trade barriers and the vogue for free-market economics, the world is now united by a global marketplace that touches five billion souls, with many countries just emerging from Marxist or mercantilist systems and having their first taste of capitalism. The story of John D. Rockefeller transports us back to a time when industrial capitalism was raw and new in America, and the rules of the game were unwritten. More than anyone else, Rockefeller incarnated the capitalist revolution that followed the Civil War and transformed American life. He embodied all its virtues of thrift, self-reliance, hard work, and unflagging enterprise. Yet as someone who flouted government and rode roughshod over competitors, he also personified many of its most egregious vices. As a result, his career became the focal point for a debate about the proper role of government in the economy that has lasted until the present day.

## PRELUDE:

### POISON TONGUE

“Reading this book brings back to my mind facts and situations that I had forgotten for years,” John D. Rockefeller mused. “It digs up things long past and dead, so that they stand before me once more alive. I am glad of it, very glad of it.”<sup>1</sup>

For months, Rockefeller had listened to his authorized biographer read aloud from Henry Demarest Lloyd’s *Wealth Against Commonwealth*, a savage account of his career published in 1894. Now retired and in his late seventies, the world’s richest man had reluctantly agreed to reminisce behind closed doors. Starting in 1917, for an hour each morning, Rockefeller fielded questions while slumped in an easy chair or reclining on a lounge in his bedroom at Kykuit, a Georgian mansion set amid the woodland beauty of Westchester County’s Pocantico Hills. Serene in his conscience, convinced that God had blessed his career and that the court of history would acquit him, Rockefeller had submitted to this exercise only to please his son, who wanted to cleanse the family name of all controversy. As Rockefeller reminded his appointed Boswell, the affable William O. Inglis, a newspaperman recruited from Rockefeller’s old nemesis, the *World*, but “for the urgent request of my son, who is not familiar with this history . . . I would never have taken the time and the trouble to make any refutation to these questions.”<sup>2</sup>

Despite his initial hesitation, Rockefeller couldn’t resist the invitation to relive his turbulent early years in the petroleum industry, and he warmed to the giant task of remembrance. During hundreds of hours of interviews, spanning a three-year period, he revisited the past and spoke his mind freely. At times, he evoked his life in the dulcet tones of a preacher addressing a brotherhood of kindred souls. At other moments, he was dryly sardonic or brutally funny about his critics—though all the while, as a good Christian, he tried to suppress vengeful feelings toward them.

Before Inglis’s wondering eyes, the old man was rejuvenated by the flood tide of memory, and his voice deepened from the high, breathy pitch of age to the mellow baritone of early adulthood. His step grew springy and lithe as he paced the floor, recounting the glorious struggles of his career. Far from dodging controversy, Rockefeller suggested a novel structure for this retrospective talk: Inglis would read passages from Rockefeller’s two chief antagonists, Henry Lloyd and Ida Tarbell (whose influential broadside had been published in the early 1900s), and Rockefeller would refute them, paragraph by paragraph. Having dismissed their indictments as beneath his dignity, he hadn’t deigned to read them when they first appeared. Now, in a measure of his feisty selfconfidence, he decided to tackle the toughest charges point-blank. “I was averse for eight months to say anything in response to these foolish writers,” he noted, “but now that I’ve gotten into it I find it interesting.”<sup>3</sup> And once John D. Rockefeller, Sr., set his mind to something, he brought awesome powers of concentration to bear.

As Rockefeller undertook this extended defense, he clearly believed that he had been vindicated in the time since these journalists had blackened his reputation in the early 1900s and made him America’s most hated businessman. “All of those in the business today are doing business along the modern lines, following the plans which we were the first to propose,” he said with pride.<sup>4</sup> Public bitterness toward him had waned, he believed, and opposition to his petroleum empire was “practically nil and has been for many years, and it has ceased to be popular to raid the Standard Oil Company.”<sup>5</sup> Indeed, the American public during World War I appreciated the industrial strength conferred by the Standard Oil companies, and Rockefeller imagined, with some justice, that his compatriots now viewed him as a public benefactor, not as a corporate buccaneer. The huge philanthropies he had endowed in recent years had also mitigated public animosity toward him.

As always with Rockefeller, the pregnant silences in the interview spoke as eloquently as the words. Coached by his publicist, Ivy Lee, Rockefeller eschewed such loaded terms as *trust*, *monopoly*, *oligopoly*, or *cartel* when referring to Standard Oil and preferred to speak of “cooperation.” He expressed scorn for the textbook world of free markets evoked by Adam Smith: “What a blessing it was that the idea of cooperation, with railroads, with telegraph lines, with steel companies, with oil companies, came in and prevailed, to take the place of this chaotic condition in which the virtuous academic Know-Nothings about business were doing what they construed to be God’s service in eating each other up.”<sup>6</sup> During the three-year interview, Rockefeller never once alluded to his most stinging setback: the federal government’s 1911 dismemberment of Standard Oil into dozens of constituent companies. Annulling the Supreme Court verdict by a trick of memory, Rockefeller talked of Standard Oil as if the old monolith still stood unscathed.

Of all the poses he assumed, perhaps the hardest to maintain was that he bore no grudges against his detractors. He peppered his talk with references to his forgiving nature. “The representatives of the Standard Oil Company cherish most kindly and brotherly feelings even toward those who abused them most, and are ready to lay it to their weakness and ignorance and whatever else was controlling them.”<sup>7</sup> Furthermore: “And to those who have uttered against them harsh words, we cherish no resentment. ‘To err is human, to forgive divine.’”<sup>8</sup> And, even more conciliatory: “And I rejoice also that we are charitable and sweet-spirited to these jealous, small men who made it the business of their lives to try to pull us down because their vision did not extend beyond the ends of their noses.”

Over time, however, the sacerdotal tone began to falter. Rockefeller couldn’t conceive of a genuinely principled objection to his career and increasingly resorted to ad hominem attacks, deriding his critics as croakers, howlers, grumblers, complainers, blackmailers, pirates, spoiled children, whiners, adventurers, wolves, and freebooters. Clearly, the allegations rankled, especially those of Ida Minerva Tarbell, whose cool, clear-eyed investigative prose had turned his name into a byword for corporate greed. With golf cronies, Rockefeller had poked fun at her, calling her “Miss Tarbarrel,” but this was a transparent attempt to draw the sting from her words.

During the marathon interview, Inglis saw Rockefeller’s iron poise and self-mastery crumble only twice and both times, significantly, in responding to Tarbell. The first time came when he read aloud her charge that in 1872 the thirty-two-year-old Rockefeller had taken over the Cleveland refineries by threatening to crush rivals who refused to join his cartel. Now, 1872 had been the starting point of his relentless march toward supremacy in oil. If that year was tainted, then everything was. Inglis recorded a graphic account of Rockefeller’s reaction to Tarbell’s allegation:

“That is absolutely false!” exclaimed Mr. Rockefeller so loudly that I looked up from the notes. As he spoke he jumped up from the big chair in which he was reclining and walked over to my table. His face was flushed and his eyes were burning. It was the first time I had ever seen him show any but pleasant feeling, and there could be no doubt that he was aflame with anger and resentment. His voice rang out loud and clear. He did not beat the desk with his fist, but stood there with his hands clenched, controlling himself with evident effort. He could not immediately regain his balance. “This is absolutely false!” he cried, “and no man was told that by me or by any of our representatives. You may put that down once and for all. That statement is an absolute lie!”<sup>9</sup>

After this outburst, Rockefeller’s emotions subsided, but the insinuation stung. Later, he and Inglis roamed over the hills and golf fairways of his vast estate; “How ridiculous all that talk is!” he exclaimed. “It’s twaddle, poisonous twaddle, put out for a purpose. As a matter of fact, we were all in a sinking ship, if existing cut-throat competition continued, and we were trying to build a lifeboat to carry us all to the shore. You don’t have to threaten men to get them to leave a sinking ship in a lifeboat.”<sup>10</sup> The purchase of his competitors’ firms had not been the benevolent act that Rockefeller suggested, but he had a powerfully selective memory.

Rockefeller reserved his most bitter epithets for another passage, where Tarbell dealt with the touchiest matter in his personal life: the character of his colorful, raffish father, William Avery Rockefeller. In July 1905, she had capped off her serial history of Standard Oil with a two-part “Character Study” of Rockefeller filled with venomous portrayals of his father, an itinerant peddler of patent medicines who had led a shadowy, vagabond life. William Avery Rockefeller had been the sort of fast-talking huckster who thrived in frontier communities of early-nineteenth-century America, and Tarbell amply reported his misdemeanors. At one point in her blistering portrait, she said, “Indeed he had all the vices save one—he never drank.”<sup>11</sup>

This thrust against his dead father probed some buried pain, some still-festering wound inside Rockefeller, and he suddenly erupted with explosive fury. “What a wretched utterance from one calling herself a historian,” he jeered, speculating, quite incorrectly, that Tarbell had been embittered by the failure of her series to dent the Standard Oil empire. “So she turned to this miserable fabrication, with all the sneers, all the malice, all the sly hintings and perversions of which she is master, and with more bitterness than ever attacked my father.”<sup>12</sup> Momentarily, Rockefeller couldn’t regain his self-control: His famous granite composure had utterly broken down. And for one of the few times in his life, he let forth a torrent of intemperate abuse. Spluttering with rage, he railed against “the poison tongue of this poison woman who seeks to poison the public with every endeavor . . . to cast suspicion on everything good, bad, or indifferent appertaining to a name which has thus far not been ruined by her shafts.” Aware that he had, uncharacteristically, let down his guard, Rockefeller soon checked himself and restored the old pose of philosophic calm, reassuring Inglis in soothing tones, “After all, though, I am grateful that I do not cherish bitterness even against this ‘historian,’ but pity.”<sup>13</sup> The titan had regained his dignity, and he made sure that his tightly fitted mask never slipped again in front of his authorized biographer.

## The Flimflam Man

In the early 1900s, as Rockefeller vied with Andrew Carnegie for the title of the world's richest man, a spirited rivalry arose between France and Germany, with each claiming to be Rockefeller's ancestral land. Assorted genealogists stood ready, for a sizable fee, to manufacture a splendid royal lineage for the oilman. "I have no desire to trace myself back to the nobility," he said honestly. "I am satisfied with my good old American stock."<sup>1</sup> The most ambitious search for Rockefeller's roots traced them back to a ninth-century French family, the Roquefeuilles, who supposedly inhabited a Languedoc château—a charming story that unfortunately has been refuted by recent findings. In contrast, the Rockefellers' German lineage has been clearly established in the Rhine valley dating back to at least the early 1600s.

Around 1723, Johann Peter Rockefeller, a miller, gathered up his wife and five children, set sail for Philadelphia, and settled on a farm in Somerville and then Amwell, New Jersey, where he evidently flourished and acquired large landholdings. More than a decade later, his cousin Diell Rockefeller left southwest Germany and moved to Germantown, New York. Diell's granddaughter Christina married her distant relative William, one of Johann's grandsons. (Never particularly sentimental about his European forebears, John D. Rockefeller did erect a monument to the patriarch, Johann Peter, at his burial site in Flemington, New Jersey.) The marriage of William and Christina produced a son named Godfrey Rockefeller, who was the grandfather of the oil titan and a most unlikely progenitor of the clan. In 1806, Godfrey married Lucy Avery in Great Barrington, Massachusetts, despite the grave qualms of her family.

Establishing a pattern that would be replicated by Rockefeller's own mother, Lucy had, in her family's disparaging view, married down. Her ancestors had emigrated from Devon, England, to Salem, Massachusetts, around 1630, forming part of the Puritan tide. As they became settled and gentrified, the versatile Averys spawned ministers, soldiers, civic leaders, explorers, and traders, not to mention a bold clutch of Indian fighters. During the American Revolution, eleven Averys perished gloriously in the battle of Groton. While the Rockefellers' "noble" roots required some poetic license and liberal embellishment, Lucy could justly claim descent from Edmund Ironside, the English king, who was crowned in 1016.

Godfrey Rockefeller was sadly mismatched with his enterprising wife. He had a stunted, impoverished look and a hangdog air of perpetual defeat. Taller than her husband, a fiery Baptist of commanding presence, Lucy was rawboned and confident, with a vigorous step and alert blue eyes. A former schoolteacher, she was better educated than Godfrey. Even John D., never given to invidious comments about relatives, tactfully conceded, "My grandmother was a brave woman. Her husband was not so brave as she."<sup>2</sup> If Godfrey contributed the Rockefeller coloring—bluish gray eyes, light brown hair—Lucy introduced the rangy frame later notable among the men. Enjoying robust energy and buoyant health, Lucy had ten children, with the third, William Avery Rockefeller, born in Granger, New York, in 1810. While it is easy enough to date the birth of Rockefeller's father, teams of frazzled reporters would one day exhaust themselves trying to establish the date of his death.

As a farmer and businessman, Godfrey enjoyed checkered success, and his aborted business ventures exposed his family to an insecure, peripatetic life. They were forced to move to Granger and Ancram, New York, then to Great Barrington, before doubling back to Livingston, New York. John D. Rockefeller's upbringing would be fertile with cautionary figures of weak men gone astray. Godfrey must have been invoked frequently as a model to be avoided. By all accounts, Grandpa was a jovial, good-natured man but feckless and addicted to drink, producing in Lucy an everlasting hatred of liquor that she must have drummed into her grandson. Grandpa Godfrey was the first to establish in John D.'s mind an enduring equation between bonhomie and lax character, making the latter prefer the society of sober, tight-lipped men in full command of their emotions.

The Rockefeller records offer various scenarios of why Godfrey and Lucy packed their belongings into an overloaded Conestoga wagon and headed west between 1832 and 1834. By one account, the Rockefellers, along with several neighbors, were dispossessed of their land in a heated title dispute with some English investors. Another account has an unscrupulous businessman gulling Godfrey into swapping his farm for allegedly richer turf in Tioga County. (If this claim was in fact made, it proved a cruel hoax.) Some relatives later said that Michigan was Godfrey's real destination but that Lucy vetoed such a drastic relocation, preferring the New England culture of upstate New York to the wilds of Michigan.

Whatever the reason, the Rockefellers reenacted the primordial American rite of setting out in search of fresh opportunity. In the 1830s, many settlers from Massachusetts and Connecticut were swarming excitedly into wilderness areas of western New York, a migration that Alexis de Tocqueville described as "a game of chance" pursued for "the emotions it excites, as much as for the gain it procures."<sup>3</sup> The construction of the Erie Canal in the 1820s had lured many settlers to the area. Godfrey and Lucy heaped up their worldly possessions in a canvas-topped prairie schooner, drawn by oxen, and headed toward the sparsely settled territory. For two weeks, they traveled along the dusty Albany-Catskill turnpike, creeping through forests as darkly forbidding as the setting of a Grimms' fairy tale. With much baggage and little passenger space, the Rockefellers had to walk for much of the journey, with Lucy and the children (except William, who did not accompany them) taking turns sitting in the wagon whenever they grew weary. As they finally reached their destination, Richford, New York, the last three and a half miles were especially arduous, and the oxen negotiated the stony, rutted path with difficulty. At the end, they had to lash their exhausted team up a nearly vertical hillside to possess their virgin sixty acres. As family legend has it, Godfrey got out, tramped to the property's peak, inspected the vista, and said mournfully, "This is as close as we shall ever get to Michigan." So, in a memorial to dashed hopes, the spot would forever bear the melancholy name of Michigan Hill.

Even today scarcely more than a crossroads, Richford was then a stagecoach stop in the wooded country southeast of Ithaca and northwest of Binghamton. The area's original inhabitants, the Iroquois, had been chased out after the American Revolution and replaced by revolutionary army veterans. Still an uncouth frontier when the Rockefellers arrived, this backwater had recently attained township status, its village square dating from 1821. Civilization had taken only a tenuous hold. The dense forests on all sides teemed with game—bear, deer, panther, wild turkey, and cottontail rabbit—and people carried flaring torches at night to frighten away the roaming packs of wolves.

By the time that John D. Rockefeller was born in 1839, Richford was acquiring the amenities of a small town. It had some nascent industries—

sawmills, gristmills, and a whiskey distillery—plus a schoolhouse and a church. Most inhabitants scratched out a living from hardscrabble farming, yet these newcomers were hopeful and enterprising. Notwithstanding their frontier trappings, they had carried with them the frugal culture of Puritan New England, which John D. Rockefeller would come to exemplify.

The Rockfellers’ steep property provided a sweeping panorama of a fertile valley. The vernal slopes were spattered with wildflowers, and chestnuts and berries abounded in the fall. Amid this sylvan beauty, the Rockfellers had to struggle with a spartan life. They occupied a small, plain house, twenty-two feet deep and sixteen feet across, fashioned with hand-hewn beams and timbers. The thin soil was so rocky that it required heroic exertions just to hack a clearing through the underbrush and across thickly forested slopes of pine, hemlock, oak, and maple.

As best we can gauge from a handful of surviving anecdotes, Lucy ably managed both family and farm and never shirked heavy toil. Assisted by a pair of steers, she laid an entire stone wall by herself and had the quick-witted cunning and cool resourcefulness that would reappear in her grandson. John D. delighted in telling how she pounced upon a grain thief in their dark barn one night. Unable to discern the intruder’s face, she had the mental composure to snip a piece of fabric from his coat sleeve. When she later spotted the man’s frayed coat, she confronted the flabbergasted thief with the missing swatch; having silently made her point, she never pressed charges. One last item about Lucy deserves mention: She had great interest in herbal medicines and home-brewed remedies prepared from a “physic bush” in the backyard. Many years later, her curious grandson sent specimens of this bush to a laboratory to see whether they possessed genuine medicinal value. Perhaps it was from Lucy that he inherited the fascination with medicine that ran through his life, right up to his creation of the world’s preeminent medical-research institute.

By the time he was in his twenties, William Avery Rockefeller was already a sworn foe of conventional morality who had opted for a vagabond existence. Even as an adolescent, he disappeared on long trips in midwinter, providing no clues as to his whereabouts. Throughout his life, he expended considerable energy on tricks and schemes to avoid plain hard work. But he possessed such brash charm and rugged good looks—he was nearly six feet tall, with a broad chest, high forehead, and thick auburn beard covering a pugnacious jaw—that people were instantly beguiled by him. This appealing façade, at least for a while, lulled skeptics and disarmed critics. It wasn’t surprising that this nomad did not accompany his parents on their westward trek to Richford but instead drifted into the area around 1835 in his own inimitable fashion. When he first appeared in a neighboring hamlet, he quickly impressed the locals with his unorthodox style. Posing as a deaf-mute peddler selling cheap novelties, he kept a small slate with the words “I am deaf and dumb” chalked across it tied by a string to his buttonhole. On this slate, he conversed with the locals and later boasted how he exploited this ruse to flush out all the town secrets. To win the confidence of strangers and soften them up for the hard sell, he toted along a kaleidoscope, inviting people to peer into it.<sup>4</sup> During his long career as a confidence man, Big Bill always risked reprisals from people who might suddenly unmask his deceptions, and he narrowly escaped detection at the home of a Deacon Wells. The deacon and his daughter, a Mrs. Smith, pitied the poor peddler who knocked on their door one Saturday and sheltered him in their home that night. The next morning, when they invited him to church, Big Bill had to resort to some fancy footwork, for he always shied away from crowds where somebody might recognize him and expose his imposture. “Billy told [the deacon] in writing that he liked to go to church, but that his infirmity caused him to be stared at, so that he was abashed and would not go,” recalled a towns-man. “He really feared that he might be exposed by someone.”<sup>5</sup> Seven months later, after the deacon and Big Bill had both moved to Richford, Mrs. Smith spotted the erstwhile deaf-mute at a social gathering and marveled at his miraculous recovery of speech. “I see that you can talk better than when I saw you last,” she said. Big Bill smiled, unfazed, his bravado intact. “Yes, I’m somewhat improved.”<sup>6</sup> When he arrived in Richford, the local citizens immediately got a taste of his fakery, for he wordlessly flashed a slate with the scribbled query, “Where is the house of Godfrey Rockefeller?”<sup>7</sup>

Since he usually presented false claims about himself and his products, Bill worked a large territory to elude the law. He was roving more than thirty miles northwest of Richford, in the vicinity of Niles and Moravia, when he first met his future wife, Eliza Davison, at her father’s farmhouse. With a flair for showmanship and self-promotion, he always wore brocaded vests or other brightly colored duds that must have dazzled a sheltered farm girl like Eliza. Like many itinerant vendors in rural places, he was a smooth-talking purveyor of dreams along with tawdry trinkets, and Eliza responded to this romantic wanderer. She was sufficiently taken in by his deaf-and-dumb humbug that she involuntarily exclaimed in his presence, “I’d marry that man if he were not deaf and dumb.”<sup>8</sup> Whatever tacit doubts she might have harbored when she discovered his deceit, she soon succumbed, as did other women, to his mesmerizing charm.

A prudent, straitlaced Baptist of Scotch-Irish descent, deeply attached to his daughter, John Davison must have sensed the world of trouble that awaited Eliza if she got mixed up with Big Bill Rockefeller, and he strongly discouraged the match. In later years, Eliza Rockefeller would seem to be a dried-up, withered spinster, but in late 1836 she was a slim, spirited young woman with flaming red hair and blue eyes. Pious and self-contained, she was the antithesis of Bill and probably found him so hypnotic for just that reason. Who knows what gloom hung around her doorstep that was dispelled by Bill’s glib patter? Her mother had died when Eliza was only twelve—she had dropped dead after taking a pill dispensed by a traveling doctor—and Eliza was raised by her older sister, Mary Ann, leaving Eliza deprived of maternal counsel.

On February 18, 1837, despite the express opposition of John Davison, this most improbable couple—Bill was twenty-seven, Eliza twenty-four—were wed at the home of one of Eliza’s friends. The marriage was a favorite gossip item among the Richford townspeople, who tended to spy guile on Bill’s part. Compared to the Davisons, the Rockfellers were poor country folk, and it is very likely that Bill was entranced by reports of John Davison’s modest wealth. As early as 1801, the frugal Davison had acquired 150 acres in Cayuga County. In John D.’s words, “My grandfather was a rich man—that is, for his time he was counted rich. In those days one who had his farm paid for and had a little money beside was counted rich. Four or five or six thousand was counted rich. My grandfather had perhaps three or four times that. He had money to lend.”<sup>9</sup>

Most Richford residents believed that Big Bill’s meeting with Eliza was less a random encounter than a premeditated bid to snare her father’s money. A notorious cad who regarded every pretty young woman as a potential conquest, Bill had at least one serious romance that antedated his wooing of Eliza. As Ralph P. Smith, a longtime Richford resident, recalled, “Billy was unmarried when he came here, and it was supposed that he would marry Nancy Brown, who was his housekeeper, but he broke with her, settling a sum said to have been about \$400 on her when he concluded to win the daughter of the rich John Davison, over at Niles, on the outskirts of Moravia.”<sup>10</sup> The story is corroborated by John D.’s cousin, Mrs. John Wilcox, who said, “Nancy Brown, of Harford Mills, was a beautiful girl, remarkably beautiful. William fell in love with her. She was poor. William would have

money. Eliza Davison's father was to give her \$500 when she married; so William married her.”<sup>11</sup>

This marriage, consummated under false pretenses, fused the lives of two highly dissimilar personalities, setting the stage for all the future heartache, marital discord, and chronic instability that would so powerfully mold the contradictory personality of John D. Rockefeller.

When Bill brought his bride back to the Richford house he'd built half a mile from his parents' place, Eliza must have pondered the wisdom of her father's disapproval: Life promised to be hard and flinty in this rough-hewn homestead. Surviving photos of John D. Rockefeller's birthplace show a plain clapboard house set on a treeless slope, outlined bleakly against the sky. The rude dwelling looked like two attached boxcars, the austere simplicity broken only by a small awning over one door. However primitive the exterior, the snug house was solidly built out of timber from local forests. The main floor had two bedrooms and a living room, topped by a low sleeping loft and attic storage room; the little attached building served as a barn and woodshed. (This bucolic birth site of the future kerosene king was probably lit by sperm oil or tallow candles.) The grounds were much more ample than the house, as the fifty-acre lot included an apple orchard and a trout-filled stretch of Owego Creek, which bubbled along the bottom of the property.

Before long, Big Bill roughly disabused Eliza of any high-flown romantic notions she might have had about matrimony. Far from renouncing his girlfriend, Nancy Brown, he brought her into the cramped house as a “housekeeper” and began having children, alternately, by wife and mistress. In 1838, Eliza gave birth to their first child, Lucy, followed a few months later by Nancy's first illegitimate daughter, Clorinda. On the night of July 8, 1839, Bill and Eliza again summoned the midwife, this time to deliver a boy, who came into the world in a bare front bedroom measuring eight by ten feet. This child, born during Martin Van Buren's presidency and destined to become the country's foremost capitalist, would survive into the second term of Franklin D. Roosevelt's New Deal. Like many other future magnates—Andrew Carnegie (born in 1835), Jay Gould (1836), and J. Pierpont Morgan (1837)—he was born in the late 1830s and would therefore come to maturity on the eve of the post-Civil War industrial boom. Several months after John's birth, Nancy Brown gave birth to a second daughter, Cornelia, which meant that Bill, lord of his own harem, managed to sire four children under one roof in just two years. Thus, the fiercely moralistic John Davison Rockefeller (appropriately named after Eliza's sober father) was sandwiched tightly between two illegitimate sisters, born into a situation steeped in sin.

Eliza couldn't have felt very comfortable with her in-laws. In general, the Rockefellers were a hard-drinking hillbilly clan, sociable and funny, fond of music, liquor, and uproarious good times, and adhering to a coarse frontier morality. As the strong matriarch, Lucy was the conspicuous exception, and Eliza drew close to her while frowning upon many of her more dissipated in-laws. During the Richford period, Bill's younger brother, Miles Avery Rockefeller, deserted his wife and decamped to South Dakota with Ella Brussee, a young woman who had done domestic work for Eliza. In a move that prefigured a future stratagem for Bill, Miles entered into a bigamous marriage with Ella and adopted his middle name as his new surname. Such re-created lives were common at a time when America had a vast, unmapped frontier and numerous sanctuaries from the law.

For a callow farm girl fresh from home, Eliza proved unexpectedly tolerant of Nancy Brown. Contrary to what one might expect, she pitied this intruder, perhaps considering the cramped ménage à trois fit punishment for having flouted her father's advice. As her niece observed, “Aunt Eliza loved her husband and she liked poor Nancy. But Aunt Eliza's brothers came down and made William put Nancy away.”<sup>12</sup> In this period of Eliza's marriage, Mr. Davison is conspicuous by his absence, leaving one to wonder whether he had temporarily washed his hands of his disobedient daughter or whether, cowed by guilt and embarrassment, she had hidden her troubles from him. By one account, when Nancy grew quarrelsome after Bill's marriage, he seized the chance to expel his shrewish mistress from the packed household. Heeding the pleas from the Davisons, he posted Nancy and the two daughters to live with her parents in nearby Harford Mills. Family legend claims that Bill, who had a weak but not entirely dormant conscience, secretly deposited clothing bundles on her doorstep. Fortunately, the years with Bill didn't blight Nancy's life, for she married a man named Burlingame, bore other children, and furnished her first two daughters with a respectable upbringing.<sup>13</sup> From the skimpy documentary evidence, we know that Clorinda died young while Cornelia grew up into a tall, smart, attractive schoolteacher with a telling resemblance to Big Bill. Sometimes he acceded to her demands for money, but there were strict limits to Bill's generosity, and he would rebuff her when she became too clamorous. Cornelia married a man named Sexton and remained in the Richford area, but only a few local residents and Rockefeller relatives knew that she was John D.'s half-sister.<sup>14</sup> To her credit, Cornelia never tried to cash in on her kinship with the world's richest man, perhaps because it would unavoidably have advertised her illegitimacy. It is impossible to determine whether Rockefeller ever knew of the existence of his two illegitimate half-sisters.

The Nancy Brown affair wasn't the only indignity visited upon Eliza, for she was often abandoned by Bill during her three cheerless years in Richford. He remained a restless and defiant individualist who preferred life beyond the pale of society. Early in the marriage, he stayed put for a while, operating a small sawmill on Michigan Hill and dealing in salt, fur, horses, and timber, but he soon resumed the footloose life of a peddler, his trips cloaked in unfathomable mystery. Like a fugitive, he would depart furtively under cover of night and return after dark, weeks or months later, flinging pebbles at the window to signal his return. To tide over his family in his absence, he arranged for credit at the general store. “Give my family anything they want while I'm away,” he instructed Chauncey Rich, whose father, Ezekiel, had founded Richford, “and when I come back I'll settle.”<sup>15</sup> Never knowing when this credit might be canceled, Eliza became extremely frugal and drilled her children in thrifty maxims such as “Willful waste makes woeful want.”

When Bill returned home, a sudden, smiling apparition, he would be riding new horses, wearing fine clothes, and brandishing a thick wad of crisp bills. Before going to see Eliza, he would pay off Chauncey Rich so that he could confidently tell her everything was now squared away at the store. His seductive charm melted away whatever hostility his absence had aroused; it took time before his extended absences and repeated betrayals burned the romance out of her system, leaving a residue of stoic resignation. For the moment, whatever her anxieties or loneliness, she seemed girlishly lovelorn during his trips, still smitten with her flimflam man. “Just look at that moon!” she once sighed to a cousin when Bill was on the road. “Is William, miles and miles away, perhaps looking at it, too, at this moment? I do hope he is.”<sup>16</sup>

On the road, Bill improvised ever more fanciful ways to make money. A crack shot, he made the circuit of shooting contests, often bringing home prize money. A glad-handing huckster, he sold rings and other knickknacks at fantastic markups. Mostly, though, he styled himself a “botanic physician” or “herbal doctor”—euphemisms faithfully parroted by some Rockefeller descendants. At a time when physicians still resorted to bleeding, blistering,

and violent purgatives, and many rustic areas lacked access to medical care, such traveling salesmen filled a vacuum. Nevertheless, in William Avery Rockefeller one clearly detects the blarney and easy conviviality of the mountebank. Sometimes he peddled bottles of home-brewed elixir or patent medicines bought from druggists, but he scored his greatest success with natural medicines culled from Lucy's physic bush. Though his mother had a sincere interest in herbal remedies, Bill would grossly distort or exaggerate their properties. For instance, he harvested small, purplish berries from her garden that resembled small pills and would hawk them to farmers' wives as a sovereign remedy for stomach troubles. His sales pitch went even further, for, as a Richford neighbor reported many years later, "he would warn them solemnly that they must not be given to a woman in a delicate condition, for they would surely cause abortion. Thereupon he would sell his pills at a high price. They were perfectly harmless, and he broke no law in selling them. He had remarkable imagination."<sup>17</sup>

The midnight rambles and peculiar commerce of William Rockefeller mystified the Richford citizenry. He both fired and troubled the imagination, generating so much gossip and speculation that they christened him Devil Bill. Rumors raced periodically through town that he was a gambler, a horse thief, a desperado. Though he seemed to operate on the edge of the law, people were delighted by his bluff humor and tall tales, if dismayed by his treatment of his family. "When he finally succeeded as a peddler he would dress up like a prince and kept everyone wondering," said one town resident who participated in the guessing game about Bill's manifold sources of income. "He laughed a great deal and enjoyed the speculation he caused. He was not a drinking man and treated his family well when he was home, but everyone knew that he neglected the family by leaving them to shift for themselves for long months at a time."<sup>18</sup> He frustrated those neighbors who ached for his comeuppance. After one prolonged absence of several months, when Eliza's bill at Chauncey Rich's topped a thousand dollars, the scuttlebutt said that Devil Bill had been arrested. Instead, like a country squire, he came trotting into town in a magnificent carriage, seated behind a team of splendid horses, diamonds glittering in his shirtfront. At the general store, he made a point of settling the tab with large bills. After such trips, Bill gathered friends and family around the dinner table and, while wolfing down heaps of food, would regale them with picaresque tales of his adventures among the western settlers and Indians. Devil Bill had a knack for weaving his experiences into spellbinding narratives, making Eliza and the children vicarious partners in his travels. As the chief casualty of Bill's peregrinations, Eliza received sympathy from her neighbors, who felt she was being abused by her husband. Yet she remained loyal to him, declined many opportunities to denigrate him, and carried herself with considerable dignity.<sup>19</sup>

However overblown the frequent biographical claims about John D. Rockefeller's impoverished childhood have been, several people testified to the family's squalor in Richford. "I do not remember ever to have seen more pitifully neglected children," one neighbor observed. "Their clothing was old and tattered, and they looked dirty and hungry."<sup>20</sup> It was a measure of Eliza's desperation that she sought relief in the home of her brother-in-law, Jacob Rockefeller, a bawdy, jolly, not infrequently besotted man. An oft-told tale about Jacob recounted how he won a five-dollar bet by staying sober during an entire trip to town.<sup>21</sup> Jacob's kindly wife became a second mother to the two toddlers, Lucy and John, darning their clothes and knitting them mittens from woolen homespun.

In this nightmarish situation, Eliza seemed to draw strength from adversity. One Richford native praised her as "a most excellent woman, but one who bore too heavy a burden at that time properly to look after her children. Her husband was away for long periods, and she had to look after their farm of sixty acres and try to make it pay their expenses. She did not know at what time the shopkeepers of the village might shut down on her credit, and she worked very hard."<sup>22</sup>

When John D. later evoked his idyllic, sunlit boyhood in upstate New York, he blotted out Richford from these reveries. Just three when he left there, he retained only a few hazy memories of the place. "I remember very clearly the brook that ran near the front of the house and how careful I had to be to keep far away from it. I remember my mother vaguely at Richford and my grandmother, who lived half a mile or so up the hill."<sup>23</sup> One notes that Rockefeller's earliest memory was associated with caution and that he edited out the absentee father and inebriated grandfather while retaining the strong, enduring mother and grandmother. He always possessed an unusual, self-protective capacity to suppress unpleasant memories and keep alive those things that fortified his resolve.

As best we can tell, Rockefeller knew nothing of Nancy Brown and the seamy side of Richford existence, yet he carried through life a vague sense of an infernal place. "I shudder to think of what I should have been if I had remained in Richford all my life," he later confided. "There were many men who hunt a little, fish a little, and drink whiskey a little, and only attain a little success in life, and all for the lack of a little religion."<sup>24</sup> Of his family's decision to leave Richford, Rockefeller offered an economic explanation that probably served as the standard cover story of his childhood: stingy soil. "The country there is beautiful," Rockefeller would say, "but the settlers wasted their energy in trying to get the stumps out of the ground, and trying to make crops grow in the poor soil."<sup>25</sup> The true reason, of course, was Eliza's horror at the town's low moral tone, as reflected by its single church; she was probably also eager to remove the children from the influence of her boisterous, drunken Rockefeller in-laws and expose them to the steadier Davisons. By no coincidence, the Rockefellers moved to Moravia, three miles from the Davison farm, where Eliza could enjoy her father's presence during her husband's habitual absences.

## CHAPTER 2

### *Fires of Revival*

When the Rockefellers moved thirty miles north from Richford to Moravia, they progressed from a backward, frontier settlement to a more sedate community with neat frame houses in the town center. Settled by the United Brethren in Christ—an evangelical denomination that later merged with the United Methodist Church—Moravia was already a stronghold of temperance and antislavery sentiment and boasted a hotel, general store, cotton mill, and Congregational church. Even today, Moravia is a quaintly authentic piece of Americana, with graceful, shady streets that have a companionable feel and houses with wide, friendly verandas.

The Rockefellers lived on the rural outskirts north of town. Around 1843, Bill put down a thousand dollars for a ninety-two-acre parcel of grassy upland that gently sloped down to Owasco Lake, one of the most picturesque of the Finger Lakes. He enlarged an existing house until it contained seven or eight rooms favored with superb views, framed by tall pines, of the bright blue lake set against a backdrop of wooded hills on the far shore. Barns stood across the road, and a smokehouse out back enabled the family to cure ham and bacon. For John D., this two-story clapboard house was a scene of enchantment and became his enduring emblem of pastoral beauty. In the summertime, he loved to pull yellow perch from the cold, clear lake, and even winters captivated him in spite of the bitter cold. The Rockefeller children slept in an unplastered upstairs room that was heated only by a stovepipe rising from the kitchen; snow flurries and sharp winter squalls pressed through cracks in the walls. “How the wind used to roar among the hemlocks by the shore of the lake!” Rockefeller remembered dreamily in his late seventies.<sup>1</sup> In the predawn dark, the children were often awakened by the sharp chopping of woodcutters or the squeal of sleds on hard-packed snow. Eliza would stand at the foot of the stairs and call up to her eldest son, “Come, my son; time to get up and milk your cow!”<sup>2</sup> To warm his feet in the dim, cold barn, John always stood on the steaming earth just vacated by the cow he was milking.

The first three Rockefeller children—Lucy, John, and William—had been born in Richford. Now, in 1843, with Big Bill again on the road during months of her pregnancy, Eliza gave birth to a second daughter, Mary Ann; two years later, twins arrived. The boy, Frank, was healthy, but Frances was sickly from birth and received some seventy visits from a local doctor before she died just short of her second birthday. Eliza tried to protect the seven-year-old John D. from this first lacerating brush with death, but it remained engraved on his memory. When he visited Moravia as an old man in his eighties, he pointed to a field and explained that “when Frances was buried I was sent over to that field to pick stones, so that I should not know.”<sup>3</sup> He later exhibited an unacknowledged dread of death, and Eliza was perhaps the first to intuit it.

In Moravia, William Avery Rockefeller acted like a strange amalgam of solid citizen and engaging ne’er-do-well. As in Richford, the townsfolk goggled as he sped by on swift horses, decked out in smart clothes, and his prodigal spending sometimes fostered the impression that he was the town’s richest man. Mary Ann later dismissed the “ridiculous” stories of their childhood poverty. “We always had plenty to eat and wear, and every reasonable kind of comfort. We were not rich, of course—far from it; but we had enough to eat and use and save—always.”<sup>4</sup> Moravia was the golden period of John’s boyhood when his father briefly aspired to gentility. One neighbor even labeled Bill “about the most notable man in the community.”<sup>5</sup> Since the region was rich in pristine pine forests, he organized a legitimate and quite successful logging business. Before dawn, guided only by starlight and lanterns, he and his work gangs carted logs to the lakeside by bobsled, then floated them up to Auburn, situated at the lake’s northern tip. In a sudden burst of civic spirit, Bill helped to select the site for the town school by counting the revolutions of his buggy wheels as he drove through town, then placing the school at the exact middle of the community; he persuaded local taxpayers to pay for it at a time when many people still thought families should educate their children at home. With the resourceful, go-getter attitude later transmitted to his son, Bill also stocked Owasco Lake with pickerel and even headed the local temperance committee. “That’s the kind of man he was,” boasted John D. “He’d get a thing done while his neighbors were beginning to talk about it.”<sup>6</sup> The Moravia period revealed an important truth about Bill: He had an underlying craving for respectability and probably didn’t plan to spend his whole life as a floating charlatan, preying on the gullible.

Bill never deigned to dirty his hands with farmwork, of course, which he considered beneath his dignity. He hired a railroad worker named Hiram Odell to work the farm and look after his family during his still-frequent wanderings. As Bill instructed him, “Their mother ain’t strong enough to manage ’em and they need some managing. Do just what you think is right for ’em.”<sup>7</sup> While Odell cultivated the garden in his spare time, Eliza assigned chores to the children. Drawing a string across the garden one day, she told the two oldest boys, “John, you take care of this side of the string, and, Will, this side is yours.”<sup>8</sup> In contrast to his father’s disdain for manual labor, John—always a self-styled son of the common people—gloried in the rigors of country life, which, he came to believe, toughened him for later industrial struggle. His frugal boyhood hardened an already stoic nature and made him proof against later adversity.

There was enough economic activity in the America of the 1840s to stimulate the fancy of any future mogul. Banks sprang up everywhere, canals crosshatched the countryside, steamboats plied the rivers, railroads and telegraphs welded together the first national markets. Territorial expansion was in the air: Texas was annexed in 1845, and war with Mexico seemed inevitable. Though only dimly aware of such distant developments, John D. Rockefeller already seemed a perfect specimen of *homo economicus*. Even as a boy, he bought candy by the pound, divided it into small portions, then sold it at a tidy profit to his siblings. By age seven, encouraged by his mother, he was dropping gold, silver, and copper coins that he earned into a blue china bowl on the mantel. John’s first business coup came at age seven when he shadowed a turkey hen as it waddled off into the woods, raided its nest, and raised the chicks for sale. To spur his enterprise, Eliza gave him milk curds to feed the turkeys, and the next year he raised an even larger brood. As an old man, Rockefeller said, “To this day, I enjoy the sight of a flock of turkeys, and never miss an opportunity of studying them.”<sup>9</sup>

Despite Rockefeller’s roseate memories, early photos of him tell a much more somber tale. His face was grim, expressionless, lacking boyish joy and animation; the skin is drawn, the eyes blank and devoid of luster. To other people, he often seemed abstracted, and they remembered him with a deadpan face trudging along country roads, lost in thought, as if unraveling deep problems. “He was a quiet boy,” said one Moravia resident. “He seemed always to be thinking.”<sup>10</sup> In many respects, John was forgettable and indistinguishable from many other boys. When he later dazzled the world, many former

neighbors and classmates struggled to summon up even a fuzzy image of him. He was a slow learner but patient and persistent and, like J. P. Morgan and Jay Gould, exhibited a terrific head for math. “I was not an easy student, and I had to apply myself diligently to prepare my lessons,” said Rockefeller, who described himself accurately as “reliable” but not “brilliant.”<sup>11</sup> For thirty weeks per year (rural children needed time off for farm chores), he attended the one-room schoolhouse established by his father, a spare white building with a pitched roof and windows adorned with dark shutters. Discipline was harsh and exacting: When students misbehaved, the teacher menacingly held a slate over their heads. If Rockefeller didn’t excel in class, it might have been in part because he lacked the bright boy’s exhibitionism, the yearning for gold stars; always inner-directed and indifferent to the approval of others, he was therefore free of a certain boyish vanity.

With the benefit of hindsight, we can see that there *was* something extraordinary about the way this stolid boy pinpointed goals and doggedly pursued them without any trace of childish impulsiveness. When playing checkers or chess, he showed exceptional caution, studying each move at length, working out every possible countermove in his head. “I’ll move just as soon as I get it figured out,” he told opponents who tried to rush him. “You don’t think I’m playing to get beaten, do you?”<sup>12</sup> To ensure that he won, he submitted to games only where he could dictate the rules. Despite his slow, ponderous style, once he had thoroughly mulled over his plan of action, he had the power of quick decision.

Although he was generally grave and devoted much time to books, music, and church, he had a sly wit, the sort that curled up unexpectedly around the edges of a sentence. As his sister-in-law said, “He had a quick sense of humor, though one might say he was soberly mirthful. His appreciation was keen, but I do not recall him as ever laughing loudly. But I do remember the quick lighting up of his eyes, and the dimples that showed in his cheek when he heard or saw anything amusing.”<sup>13</sup> His sister Mary Ann remembered him as an inveterate tease. “He would plague us all with his jokes, always with a straight, solemn face.”<sup>14</sup> Rockefeller always had a droll sense of fun, but it was often obscured behind a mask of gravity.

John D. Rockefeller was drawn to the church, not as some nagging duty or obligation but as something deeply refreshing to the soul. The Baptist church of his boyhood provides many clues to the secrets of his character. As a young man, he was raised on a steady diet of maxims, grounded in evangelical Protestantism, that guided his conduct. Many of his puritanical attitudes, which may seem antiquated to a later generation, were merely the religious commonplaces of his boyhood. Indeed, the saga of his monumental business feats is inseparable from the fire-and-brimstone atmosphere that engulfed upstate New York in his childhood. Even his father, wont to flirt with the devil’s company, knew many hymns by heart and urged his children to go to church; he once offered John five dollars to read the Bible cover to cover, thus creating an early, unintentional association between God and money. Always an iconoclastic, outlaw spirit, Bill never actually joined a church—that would have been going too far—so John identified religion with his beloved mother, who found in the Bible a balm for her troubled spirit.

John attended a Sunday school a short distance from their hilltop house and remembered the teacher as a formerly profane man who had repented and become an earnest Christian. The boy saw religion less as a system of otherworldly rewards than as a means for moral reformation on earth. Since Bill was often away, Eliza coaxed a Presbyterian neighbor into dropping off her and the children at the Baptist church on Sunday mornings. As the family huddled together in a pew, Eliza encouraged the children to drop pennies into the collection plate; Rockefeller later cited his mother’s altruism as the genesis of his philanthropy. Early in life, he learned that God wanted his flock to earn money and then donate money in a never-ending process. “I was trained from the beginning to work and to save,” Rockefeller explained. “I have always regarded it as a religious duty to get all I could honorably and to give all I could. I was taught that way by the minister when I was a boy.”<sup>15</sup> The low-church Baptists didn’t prohibit the accumulation of wealth but did oppose its vain, ostentatious display, setting up a tension that would be threaded throughout Rockefeller’s life.

While the first Baptist church had been founded by Roger Williams in Rhode Island in 1639, the denomination didn’t flourish until the so-called Great Awakening that began around 1739. This upsurge of religious fervor gathered force following the tour of the eastern seaboard by the charismatic English Methodist evangelist George Whitefield. In open fields, amid much weeping, shrieking, fainting, and guilty writhing on the ground, masses of people were converted to Christianity or had their sagging faith restored. This period of rabid emotion spurred fantastic growth among Baptists, who believed in voluntary immersion and a public confession of faith from adherents. More than one hundred new Baptist churches sprang up in New England alone. With their lay leaders and autonomous congregations, the Baptists were ideally suited to frontier areas and the democratic ethos of the colonists. Recruited from the common people, often unpaid and poorly educated, Baptist ministers ventured into the hinterlands where other clergymen feared to tread. Because they opposed religious establishments and owed no allegiance to supervisory bishops or a central church hierarchy, they could start up a church in any creek or hollow. They emerged as a major religious force by the close of the eighteenth century.

A Second Great Awakening aroused New England and the mid-Atlantic states to a new pitch of religious fever from 1800 to the late 1830s. This protracted movement peaked around 1830, when the revival fires blazed so hotly that Rochester and other sections of upstate New York and Ohio were dubbed the Burned-Over District. When revivalists—of whom Charles Grandison Finney was the most celebrated—arrived in a town, they held prayer meetings that often lasted through the night. These theatrical spectacles, marked by dramatic outpourings of emotion, featured hardened sinners who sat on the “anxious bench” as townspeople publicly urged them to repent. When they saw the light, the guilty parties often burst into tears and knelt in prayer. Preachers tried to reach people through vivid appeals to hope and fear, invoking heavenly bliss and burning lakes of hellfire. One popular evangelist, Jacob Knapp, described tormented sinners crawling up the sides of burning pits while devils with pitchforks, perched on the rim, sadistically prodded them back down into the flames. The revival movement was self-perpetuating, for the saved were expected to rescue others from Satan’s clutches. They would go door-to-door, trying to flush sinners from their homes until the entire town was caught up in passionate, hysterical emotion.

Several aspects of this revival movement are worth noting because they are so strikingly reflected in Rockefeller’s life. In the late 1820s, militant evangelicals in Rochester agitated against smoking, dancing, card playing, billiards, and the theater, while boycotting stores that opened on the Sabbath. As Rockefeller said, “Going back . . . to my early business days and boyhood, the Baptists I knew listened to their consciences and their religious instructions, not only did not dance in public places but did not dance anywhere and did not even concede the reputability of dancing. . . . The theater was considered a source of depravity, to be shunned by conscientious Christians.”<sup>16</sup> Because liquor was considered a satanic brew, a believer couldn’t make it, sell it, or offer it to guests, and a temperance pledge became a standard component of accepting Christ into one’s life. In his boyhood, Rockefeller internalized an abiding sense that the professing Christian had to be a soldier armed against all secular temptation and must never stray far

from godly circles.

Departing from strict Calvinism, Baptist evangelicals clung to the egalitarian view that *all* errant souls could be saved, not just a small, predestined elect, and they actively engaged in evangelism and missionary work. Rockefeller was brought up to believe that nobody was ever irretrievably lost, that people were free agents who could be redeemed by an act of will—a self-reliant outlook that stamped his conservative political views. His Baptist upbringing also predisposed him to follow the cult of perpetual self-improvement that played so prominent a role in nineteenth-century American culture. Finney, for instance, was a Presbyterian who exhorted his listeners to pursue perfection in their earthly lives.

Rockefeller entered the Baptist Church at a fateful moment. In May 1845, in a schism over the issue of slaveholders serving as missionaries, Baptist delegates from nine southern states seceded from the national body to create the Southern Baptist Convention. Northern Baptists fervently believed that abolitionism was consistent with their opposition to ecclesiastical hierarchy, their populist spirit, and their broad-based campaign to purge sin from society. The Second Great Awakening had explicitly linked personal conversion with community reform, spawning political activism. During the colonial period, Americans had liberally consumed demon rum, but the new evangelical emphasis on social uplift helped to foster a national temperance movement in the 1820s and 1830s. For Rockefeller, an apolitical man, the church narrowed his social life but widened his vision, providing a bridge to larger social concerns and ultimately preparing him for the world of philanthropy.

If John D. believed, despite the flamboyant antics of Devil Bill, that he had enjoyed a homespun boyhood out of a Currier & Ives print, it was largely due to the compensating influence of Eliza and the church. Her hardships tapped some deep reserve of strength and wisdom in the simple country woman with the spare face, quiet ways, and steady blue-gray eyes. “Mother was wonderful,” said Mary Ann. “She managed the family and the house and did it all so easily.”<sup>17</sup> Though Eliza dutifully read the Bible, her few surviving missives reveal an extremely rudimentary education; she misspelled the most elementary words, writing *herd* for *heard*, *plesant* for *pleasant*, and *ben* for *been*. (John was a faultless speller and grammarian.) All but a stranger to grammar, she sometimes wrote letters that consisted of a single run-on sentence.

It is hard not to be stirred by Eliza’s uncomplaining bravery in steadily tending five children in the face of her husband’s erratic, irresponsible ways. When Bill was on the road, she never knew where he was, what he was doing, or when he might surface again. Though she had Hiram Odell, and her father lived just across Owasco Lake, Eliza was often alone with the children at night in a town on the fringe of a wilderness. As she thumbed her Bible and puffed on a corncob pipe, she must have worried about roving thieves. One of Rockefeller’s favorite stories reveals her coolheaded response to danger:

*Mother had whooping cough and was staying in her room so that we should not catch it. When she heard thieves trying to get at the back of the house and remembered that there was no man to protect us, she softly opened the window and began to sing some old Negro melody, just as if the family were up and about. The robbers turned away from the house, crossed the road to the carriage house, stole a set of harness and went down the hill to their boat at the shore.*<sup>18</sup>

From such early experiences, John D. took away a deep, abiding respect for women; unlike other moguls of the Gilded Age, he never saw them in purely ornamental terms.

Born in 1813, Eliza had grown up in the shadow of the Second Great Awakening and was never lax about discipline. While Devil Bill dispensed gifts to the children, Eliza, by default, meted out punishment and tried to subdue the wild Rockefeller streak in her children. A kindred spirit, John accepted her stern country justice when she drew out the birch switch, strapped him to the apple tree, and “laid on Macduff,” as she styled it. “On those occasions I made my protests, which she heard sympathetically and accepted sweetly—but [she] still laid on, explaining that I had earned the punishment and must have it,” Rockefeller recalled. “She would say, ‘I’m doing this in love.’”<sup>19</sup> She typically erred on the side of severity. Once, while punishing John for misbehavior at school, he started to plead his innocence. “Never mind,” she interrupted, “we have started in on this whipping, and it will do for the next time.”<sup>20</sup> Rockefeller told a tale of his adolescence that highlighted his mother’s grim discipline. They then lived in Owego, and she had forbidden him to ice-skate on the Susquehanna River, but the lure of a moonlit night overwhelmed the better judgment of John and his brother William. They were gliding along the river when they heard the desperate cries of a young boy who had fallen through the ice. Pushing a pole to the flailing boy, John and William fished him from the water and saved his life. When they returned home, Eliza hailed their courage, then promptly got down to business. “We thought we should be left off without punishment,” said Rockefeller, “but mother gave us a good tanning, nevertheless.”<sup>21</sup>

Where William and Frank had their father’s broad face and high forehead, John had Eliza’s narrow face, piercing eyes, and sharp chin and a personality that conformed more to the Davison pattern. He also had his mother’s slow metabolism and ability to bear a large burden for long periods in an unruffled way. Many neighbors testified that the unflappable Eliza never lost her temper, never raised her voice, never scolded anyone—a style of understated authority that John inherited. From his mother he learned economy, order, thrift, and other bourgeois virtues that figured so largely in his success at Standard Oil. Forced to pay a heavy penalty for her impetuous decision to marry Devil Bill, Eliza trained her children to reflect coolly before making decisions; her frequent admonition “We will let it simmer” was a saying John employed throughout his business career.

For a woman of Eliza’s intense pride and religiosity, it must have been hard to endure the unaccountable absences of her gallivanting husband, and she drew closer, of necessity, to her oldest son, who struck her as precocious and prematurely wise. She saw qualities in him still invisible to the world at large. Because she confided in him and gave him adult responsibilities, he matured rapidly and acquired unusual confidence; it must have flattered his pride that he served as a surrogate father and was so vital to the family’s survival. His relations with his siblings seemed more paternal than fraternal, and he often instructed them. As he put it, “I know that in my own case I have been greatly helped by the confidence imposed in me since early boyhood.”<sup>22</sup> Of course, this boyhood responsibility took its toll on John D., who experienced little of the spontaneous joy or levity of youth. Growing up as a miniature adult, burdened with duties, he developed an exaggerated sense of responsibility that would be evident throughout his life. He learned to see himself as a reluctant savior, taking charge of troubled situations that needed to be remedied.

Until he came to appraise him through more mature eyes, John idolized his father. A man capable of Paul Bunyan-esque feats, William Avery

Rockefeller possessed the dash and virility that every young boy dreams of in a father. “I come of a strong family, men of unusual strength, a family of giants,” Rockefeller stated later in life.<sup>23</sup> “What a bright smile my father had. Everybody liked him. ‘Uncle Billy,’ they called him.”<sup>24</sup> By all accounts, Bill was a man of abundant talents. He was such a superb athlete that he could stand beside a fence and jump over it backward; such an amazing ventriloquist that he could create half a dozen characters talking at once; such a legendary animal trainer that he once taught tricks to a pet bear he had won in a shooting competition; and such a skillful hypnotist that he was darkly rumored to “throw a mist” around person and beast alike.<sup>25</sup>

If the children associated Eliza with discipline, they identified Bill with laughter, plenty, and good times. He was the ideal hunting and fishing buddy, a crack shot who could bring down small birds in flight. Mesmerized by guns, he kept a splendid set of clean, well-oiled rifles (including one with a telescopic sight) in the Moravia house. Taking aim at a pine tree while standing in a meadow, he would toss off rapid shots until the bark was shredded by bullets. When selling patent medicines, his marksmanship served him extremely well, for he would use it to draw a crowd in strange towns. Setting up a manikin with a clay pipe in its mouth, he retreated to a distance of two hundred paces, shot the pipe to smithereens, then offered a ten-dollar bill to anybody in the crowd who could match his prowess.

Lively and fun-loving, Bill created infectious merriment wherever he went. As his son noted, “He always wanted something going on in the house, singing or music of some sort.”<sup>26</sup> He was nothing if not shrewd and used his talents to further his enjoyment. One day, he heard of a violin virtuoso who had been clapped in the town jail for drunkenness. The offender was given a choice: Either he could pay a hundred-dollar fine or serve a hundred days in jail, with each day served reducing the fine by a dollar. Unable to muster the hundred dollars, Bill let the musician stew for thirty-five days, then bailed him out for sixty-five dollars, taking his violin in exchange. For decades, Bill cherished this rich-toned, concert-quality instrument, which he would bow at waist level, like a country fiddler. It was undoubtedly from the Rockefeller side of the family that John inherited his lasting love of music.

With Owasco Lake always shimmering through the window, many of John D.’s dearest memories of Moravia centered upon fishing with Bill, who was prone to do outrageous things in the boat. During one lake outing, the middle brother, William, then a fat little boy unable to swim, made the mistake of grumbling about the heat. “Then cool off,” said his father, who plucked up the flabbergasted boy by the waistband and pitched him headlong into the water. When William sank straight to the bottom, Big Bill dived overboard, retrieved him, then tried to teach him to swim. As John said of the incident, looking on the bright side, “He was always training us to meet responsibilities and take care of ourselves.”<sup>27</sup>

It would be wrong (if highly tempting) to see William Avery Rockefeller as simply some blithe, hedonistic spirit, for he was moralistic in his own way. He was a militant temperance advocate—alcohol having ruined his father, Godfrey—and he fiercely reproached John and William when he caught them smoking in the barn. “When, after my brother had reached the age of 40 years my father learned that he smoked, tears came into his eyes,” said John, who liked to focus on his father’s virtuous side as a convenient way to sidestep his vices.<sup>28</sup>

In no area did Bill impress his eldest son more—or did his eldest son prove more impressionable—than in the magical realm of money. Big Bill had an almost sensual love of cash and enjoyed flashing plump rolls of bills. “John D. Rockefeller inherited his shrewdness and love of money from his father,” remarked one of Bill’s companions. “The old man had a passion for money that amounted almost to a craze. I never met a man who had such a love of money.”<sup>29</sup> Exhibiting a small-town, populist mistrust of banks—a mistrust he would pass along to John, who later kept Standard Oil free from the talons of Wall Street financiers—Bill stashed away his money at home. As one neighbor recalled, “He had money, lots of it. He kept it in a bureau drawer. There I’ve seen it, ones, twos, threes (we had three-dollar bills then), fives, tens, twenties, and fifties, all corded like wood and the bundles tied with twine, the stacks filling the drawer.”<sup>30</sup> According to legend, he also had a four-gallon pail brimming with gold pieces, though it probably concealed base metal beneath the glittering surface. Once, at a family gathering, Bill disappeared for a time, then suddenly burst forth from his room with a patchwork tablecloth crafted from banknotes of varying denominations. This was part of his obsessive need to project a big-shot image to conceal the pettiness of his accomplishments. Neither as a boy nor a man did John find anything pathological about his father’s money madness, suggesting that he shared the same blind spot. After he had made his gargantuan fortune, he said admiringly of his father, “He made a practice of never carrying less than \$1,000, and he kept it in his pocket. He was able to take care of himself, and was not afraid to carry his money.”<sup>31</sup>

The bane of John’s boyhood wasn’t poverty so much as chronic worry about money, and it is easy to see how cash came to seem like God’s bounty, the blessed stuff that relieved all of life’s cares. After the family spent anxious weeks or months running up credit bills and waiting for Father’s return, Bill would abruptly materialize, a jolly Santa Claus, swimming in lucre. He would compensate for his long absence by extravagant shows of generosity with his children. For John, money became associated with these brief but pleasurable interludes when the mercurial father was at home and the Rockefellers functioned as a true family.

During the early Moravia years, Big Bill began to train his eldest son in business matters, dispatching him at age eight or nine to evaluate and buy cord-wood for the house. “I knew what a cord of good solid beech and maple wood was,” said Rockefeller. “My father told me to select only the solid wood and the straight wood and not to put any limbs in it or any punky wood.”<sup>32</sup> Of all the lessons John absorbed from his father, perhaps none surpassed in importance that of keeping meticulous accounts. This was a matter of necessity, for Bill’s wayward life forced his family to husband their credit and closely monitor their often precarious financial situation.

When it came to business ethics, Bill was a most curious compound, extremely honorable one moment, a sharpster the next. To his son, he tacitly conveyed the message that commerce was a tough, competitive struggle and that you were entitled to outwit the other fellow by any means, fair or foul. He tutored John in a sharp, relentless bargaining style that the latter made famous. (A most unorthodox bargainer, Bill once bid a thousand dollars less for a farm than the owner was asking; to settle matters, he suggested they shoot at a target. Bill won and got his thousand-dollar discount.) As a traveling mountebank, selling dubious cures to credulous rural folk, Bill took a dim view of people’s intelligence and didn’t hesitate to exploit their naive trust.

As a boss, Bill patented his own queer style of managing people. During his respectable time in the lumber business, he paid his men well and promptly and was said by his son to be very popular. Yet he had a habit of hiring workers for a spell, informing them politely, “I don’t need you any longer,” then hiring them again a few days later—what he proudly dubbed his “policy of firing and hiring over.” If this made him sound like a less-than-

lovable boss, his son applauded the unsettling tactic. “It kept the men up on tip-toe; no stagnation among them.”<sup>33</sup> Oddly enough, John described his father as “most liberal and kindly with his employees, yet eminently practical and keen and wide-awake and resourceful.”<sup>34</sup> This was one of many areas where he seemed to embroider the truth about Big Bill. Would the people he fired and hired again have described Bill as “liberal and kindly”?

John D. Rockefeller portrayed his father as a paragon of business virtue, and if this was mostly an effort to cover up the shady side of Bill’s life, it had a grain of truth. Bill paid his debts punctually and believed implicitly in the sacredness of contracts, taking great pains in writing them up. As John observed, “He was very scrupulous to carry out his contracts, particular[ly] that they were clearly understood and carefully drawn, that is, committed to writing. And the training he gave me along those lines was very valuable, has proven so in all my life.”<sup>35</sup> In his business career, John D. Rockefeller was accused of many sins, but he took pride in paying his debts promptly and abiding strictly by contracts. He was also accused of mixing the lawless and the honorable, of ignoring ethical niceties, in a manner reminiscent of his father.

Whether John D. Rockefeller ultimately followed his father’s unscrupulous craft or his mother’s stern respectability in steering Standard Oil is the question that weighs most heavily on his historical reputation. Bertrand Russell once said of Rockefeller, “What he said, what he thought, and what he felt, came from his mother, but what he did came from his father, with the addition of a great caution generated by early unpleasantness.”<sup>36</sup> The issue is much more complicated than that, but there’s no doubt that Rockefeller’s achievement arose from the often tense interplay between the two opposing, deeply ingrained tendencies of his nature—his father’s daring and his mother’s prudence—yoked together under great pressure.

Given the paucity of hard evidence about Bill’s affairs in Moravia, one is led to rake over the rich folklore he left behind. In 1927, a carpenter turned author named Charles Brucher published a book entitled *Joshua: A Man of the Finger Lakes Region*, a thinly disguised roman à clef about William Avery Rockefeller. The privately printed 130-page book has become something of a collector’s item, with copies sometimes fetching hundreds of dollars. The protagonist is one William Rockwell, a.k.a. Big Bill, and the author brazenly mingles fact and fiction by reproducing an actual photo of Rockefeller’s father in the front. *Joshua* professes, redundantly, to be a “true story taken from life” and gathers lore about Devil Bill that was still titillating the town gossips in the 1920s. Much of its store of legend came from Melvin Rosekrans, whose father, Joshua, had locked horns with Big Bill in the 1840s. The book presents a slanted, hyperbolic portrait of Bill’s career, a compendium of his presumed misdeeds, yet enough details tally with documentary material from other sources that it merits review.

According to this potboiler, the “masterful and self-confident” Big Bill became “the terror of the Finger Lakes region,” whose “evil influence would be felt in every household for miles around.” Eliza makes a cameo appearance as “a sad-faced little woman” kept ignorant of the true reasons for her husband’s mysterious trips: “She was always opposed to ‘Big Bill’s’ roving disposition and his evil minded tendencies.”<sup>37</sup> If she suspected wrongdoing, she kept it to herself to spare the children. That the fictional Eliza earned the sympathy of the community jibes with what we know of the real Eliza’s Moravia life.

The book narrates how Rockwell fell in with a bunch of desperadoes who stole horses and delivered them to the notorious Loomis Brothers gang. (This grave, unsubstantiated charge shadowed Bill in all three New York towns he lived in.) Another equally grave charge in the book concerns Dr. William Cooper, a cousin of the novelist James Fenimore Cooper. Dr. Cooper disliked Bill and refused to deal with him. The book asserts that Rockwell once coerced at gunpoint a reluctant Dr. Cooper to treat Eliza and that somebody afterward took potshots at the doctor through the blinds of his living-room window, narrowly missing him. Rockwell is further portrayed as an unconscionable philanderer, who lures pretty girls with a secret love potion and tries to seduce a young woman working in his house. He openly squires his girlfriends around Moravia in his carriage and takes them rowing on the lake, notwithstanding Eliza’s dismay. “The poor, long suffering little woman knew the failings of her dashing mate. She was overpowered by his master mind and had long since become resigned to her fate.”<sup>38</sup> The diabolical Bill is even accused of palming off counterfeit bills.

At first, the locals were so petrified of the rough-and-tumble Rockwell that they didn’t dare to confront him. Yet *Joshua* ends as a tale of justice triumphant as Bill’s gang is disbanded by an irate citizenry. In a climactic courtroom scene, it is proved that Rockwell had paid a black man ten dollars to steal rafting chains in order to smuggle logs across Owasco Lake. His luck having run out, Bill flees the courtroom, though another gang member serves time in Auburn prison for horse theft. When last seen in the book, Big Bill has shifted operations to Owego, where horses again begin to disappear suspiciously. In a shameless bit of press agency that Bill himself would have savored, Brucher ends by promising a sequel, adding, “Negotiations are pending for the filming of this gripping story and its early appearance on the silver screen is assured.”<sup>39</sup>

In the early 1900s, when Ida Tarbell dispatched a research assistant to upstate New York, he picked up the same allegations of horse theft that flavor the pages of *Joshua*. Horses were said to have begun vanishing after Big Bill moved first to Richford and later to Moravia. “It became noised about the neighborhood that ‘Old Bill’s gang’ were the horse thieves,” reported Tarbell’s assistant.<sup>40</sup> In 1850, three of Bill’s cronies—Caleb Palmer, Charles Tidd, and a man named Bates—were arrested for stealing mares. After Tidd turned state’s evidence, he provided the testimony that was used to incarcerate Palmer and Bates. It must be stressed that no court records actually connect Bill with the crime and that biographer Allan Nevins, after much examination, branded the horse-thieving charges “ridiculous.”<sup>41</sup> Yet the anecdotal evidence can’t be so easily dismissed. Tarbell’s assistant noted, “Everyone I talked with in Moravia declares that ‘Old Bill’ was the head of the gang.” John Monroe Palmer, son of one of the jailed culprits, fingered Bill as the mastermind of the “underground horse railroad.” “Rockefeller was too smart to be caught,” he griped. “He ruined my father, and then left him in the lurch.”<sup>42</sup>

Another tale circulating in upstate New York at the turn of the century contended that Bill had corrupted the village youth by teaching them how to gamble. One ancient resident, Hiram Alley, recalled that the village boys would pay Bill five dollars to instruct them in card tricks so they could then fleece other boys. John D. never commented on allegations against his father but, having never touched cards in his life, scoffed at this particular libel. “If my father had been a gambler, I would have known something about cards, wouldn’t I?”<sup>43</sup>

Clearly, Devil Bill had a suggestive personality that made imaginations run riot, and some of the stories about him were likely embellished. Yet one charge left behind a more convincing paper trail. Beginning with Nancy Brown in Richford, Eliza had always employed a young woman to assist with

the housework, and in Moravia she had a tall, pretty young woman helper named Anne Vanderbeak. On July 26, 1849, according to papers filed at the Auburn Court House, William Avery Rockefeller was indicted for assaulting Anne Vanderbeak on May 1, 1848, and “then and there violently against her will feloniously did ravish and carnally know” her.<sup>44</sup> The rape indictment deepens suspicions that Bill was more than just a charming, flirtatious rogue.

The aftermath of the indictment was inconclusive, and the whole affair has been obscured by a heavy fog of speculation. Bill never appeared in court, never went to trial, and was never arrested. Everybody who has examined the case has tripped over the same set of questions. Why was the indictment handed down more than a year after the supposed rape? (One feminist scholar has helpfully noted the formidable obstacles placed in the way of women pressing rape charges in those days.)<sup>45</sup> Why did the prosecuting attorney never endorse the indictment? Why didn’t anybody set off in hot pursuit of Bill when he fled from Cayuga County? And why did Anne Vanderbeak let the matter lapse? Once again, a handful of oral histories suggest a tangled skein of local intrigue. Bill had seduced a young woman named Charlotte Hewitt, whose brothers, Earl and Lew, loathed him for it. One Hewitt brother sat on the jury that indicted Big Bill, leading some to see it as a trumped-up charge, a vendetta by the brothers. Ida Tarbell’s assistant devised another theory: “I believe the indictment was quashed, possibly on the understanding that he was to leave the county. This was not unusual procedure in those days.”<sup>46</sup>

The scandal ended whatever tentative truce Bill had struck with John Davison, who had long rued the day when Bill Rockefeller first bewitched his sensible daughter. During the Moravia period, Davison had patched up relations with Bill and lent him almost \$1,000 in two installments, one in August 1845, the other in October 1846. Now the rape indictment shattered their still tenuous relationship—lending greater credence to the charge. When Bill informed Davison of the accusation and asked him to post bail, Davison gruffly replied that he was “too old a man to go bail for anyone.” Taken aback, Bill replied bitterly that he would leave the county and never see him again. Worried about his two outstanding loans, Davison went straight to court, claimed his son-in-law planned to defraud his creditors, and sued him for \$1,210.75.<sup>47</sup> For Eliza and her offspring, it must have been a thoroughly humiliating moment when the sheriff and two neighbors came to appraise their property and attached all their movable goods in the name of John Davison. Davison also modified his will, placing Eliza’s inheritance in the hands of trustees, in all likelihood to keep it safely beyond the eager grasp of his son-in-law.

During the second half of 1849, Bill abandoned his family and gadded about the countryside to reconnoiter new towns. In the spring of 1850, the same year Nathaniel Hawthorne published *The Scarlet Letter*, Bill resettled his family in Owego, near the Pennsylvania border. As a fugitive from justice, he might have wanted to be near the state line whenever trouble loomed. Though only ten at the time and probably ignorant of what had happened—it’s hard to imagine Eliza confiding such scandalous things to a young boy—John later ridiculed the rape charge and mocked the idea of his father fleeing justice. “If [my father] left ‘under compulsion’ . . . I should have known something about it. There was nothing of the sort. We moved over to Owego, and if he were fleeing from justice that wasn’t very far away.”<sup>48</sup> John’s later tendency to minimize the disgrace probably had several causes, ranging from filial piety to shrewd public relations; he knew people bent upon proving his own immorality wanted to buttress their case by first tarnishing his father. One must also note his penchant for denial, his potent capacity to filter out uncomfortable thoughts, especially about his father, just as he later deflected criticism of his questionable business behavior. John D. Rockefeller drew strength by simplifying reality and strongly believed that excessive reflection upon unpleasant but unalterable events only weakened one’s resolve in the face of enemies.

At some point in his boyhood, however, possibly after the flight from Moravia, John’s reverence for his father did begin to be intermingled with more hostile, unexpressed feelings. (One writer of a wildly psychoanalytic bent has even suggested that Rockefeller’s icy self-control was a reaction to repressed fantasies of murdering his father.)<sup>49</sup> In later years, scores of John D.’s friends and associates noted that Big Bill was a taboo topic that they broached at their peril, one on which John maintained a thoroughgoing silence. As one early biographer remarked, “From the beginning to the end of his career, he has made secrecy respecting his father and stealth respecting paternal visits a matter of religious observance.”<sup>50</sup>

We cannot tell when Rockefeller first felt shame about his father, but this emotion was so consequential for his entire development that we must pause briefly to consider it. In the towns of John’s boyhood, Bill was an engaging but notorious character who prompted interminable speculation about his travels and sources of income. A boy with such a father needed to screen out malicious gossip and cultivate a brazen indifference to community opinion. This bred in him a reflexive habit of secrecy, a fear of the crowd, a deep contempt for idle chatter and loose tongues that lasted a lifetime. He learned to cultivate a secretive style and a defiant attitude toward strangers. Perhaps out of a self-protective instinct, Bill taught his children to be wary of strangers and even of himself. When John was a child, Bill would urge him to leap from his high chair into his waiting arms. One day, he dropped his arms, letting his astonished son crash to the floor. “Remember,” Bill lectured him, “never trust anyone completely, not even me.” Somewhat later, walking with his boys through Cleveland, he warned them to ignore the pell-mell rush of people to fires and parades. “Never mind the crowd,” he told them. “Keep away from it. Attend to your own business.”<sup>51</sup> Eliza also must have inoculated the children’s minds against talebearers and told them not to discuss family matters with other people. The boy who faced down the vicious talk of neighbors would be extremely well prepared to walk unscathed and even defiant through the turbulent controversies that later surrounded his life.

For all the uncertainty of their lives, the Rockefellers, in their restless, driven odyssey across the southern tier of New York, enjoyed a sense of upward mobility as they journeyed from Richford to Moravia to Owego, with each town larger, more prosperous, and more hopeful than its predecessor. The county seat of Tioga County, located south of Richford and west of Binghamton, Owego sits astride a broad, beautiful bend of the Susquehanna River. Decidedly more cosmopolitan than anything young John D. had experienced before, it was a refined village with genteel homes along Front Street that vouchsafed glimpses of a finer life. The incorporated village of Owego had an imposing courthouse, a well-stocked library, a renowned school, and other nascent hints of culture. For a country town of seventy-two hundred people, it also boasted a disproportionate number of resident writers and artists.

Perhaps because his sojourn there was shorter, Rockefeller never developed quite the same fond attachment to Owego as to Moravia, but he retained pleasing associations with it. “What a beautiful place Owego is!” he once exclaimed. “How fortunate we were to grow up there, in a beautiful country, with good neighbors, people of culture and refinement, kind friends.”<sup>52</sup> With amusement, he recalled how Owego had exploded his provincial boyhood. “Down at the railroad station one day I saw a Frenchman! Think of that—a real, live Frenchman. And he wore a mustache—the first I ever saw.”<sup>53</sup> On

June 1, 1849, shortly before the Rockefellers arrived, the Erie Railroad had first puffed into Owego, thousands of spectators packing the hillsides to cheer the train as it slid into the station amid a burst of ceremonial cannonades and pealing church bells. “Railroad trains were known even when I was a boy but they were few, short and sooty,” Rockefeller said of the conveyances that would figure so largely in his own exploits.<sup>54</sup> In small towns like Owego, the railroad ended isolated, self-contained economies, absorbing them into regional and national markets while also sharpening their inhabitants’ appetites for material goods and inviting them to seek their fortunes in distant cities.

The Rockefellers lived three miles east of town in an area of soft, bucolic meadows and riverine groves. Of the two frame houses they occupied during their time in Owego, the second was smaller, suggesting that Bill and Eliza needed to retrench as they grappled with financial problems. The second house—more a cottage than a farm—had a fine view of the winding, muddy Susquehanna, with the wooded silhouette of Big Island (later Hiawatha Island) in the foreground, ringed by a curtain of blue hills in the distance. In these snug quarters, John shared a bed with brother William. “It was a small house,” John reminisced years later, “but a dear good house.”<sup>55</sup>

Bill might have chosen Owego because it had signal business advantages for someone who dabbled in the lumber business. During freshets, log rafts were easily floated down the Susquehanna River, and several lumber mills, in consequence, had sprung up in the town. It might also be significant that on September 27, 1849, right before the Rockefellers moved to Owego, an appalling conflagration had consumed 104 downtown buildings, the blaze sparing only three stores, a disaster that presaged a booming lumber business as the town was rebuilt. Finally, the town had a reputation as a mecca for self-styled doctors. As one Owego resident recalled, “After the Civil War, there were a dozen of them living here.”<sup>56</sup>

During the three Owego years, Bill’s escapades seemed even more bizarrely unpredictable than before. His appearances in town were brief and infrequent, however memorable to the gaping natives. “He was the best-dressed man for miles around,” said a close neighbor. “You never saw him without his fine silk hat.”<sup>57</sup> Now in her late thirties, Eliza was losing her youthful bloom and developing the hard, thin face that told of her many trials. Many townsfolk recalled her as a sweet, fine, dignified lady who called on neighbors in the afternoon, always clad in a black silk dress that looked like widow’s weeds. Everybody commended her unsparing discipline, neat appearance, and commanding presence. For all her travails, she didn’t seem as forlorn as she had in Richford and Moravia, as if growing more accustomed to the burden that she bore and more reconciled to Bill’s absences.

Once the swaggering, autocratic husband, Bill had now been irredeemably exposed as a scoundrel and was demoted in Eliza’s esteem. Her disillusionment with her handsome husband might have simplified matters in the household. “It was she who brought up the family,” said one observer, “for even when he was at home the father did not interfere with her discipline. And it was discipline.”<sup>58</sup> Another neighbor termed her “an unusually clear-minded and capable Christian mother. Perhaps her discipline might seem very strict or even severe today, but, although she made them obey her and kept them all busily employed, the children all loved her as she loved them.”<sup>59</sup> She wasn’t a mother to be trifled with. Once, while sick in bed, she discovered that John had neglected to perform a task for her, and judgment was swift: She sent him to the Susquehanna to select a willow switch. With the quiet cunning that would become a pronounced trait of his nature, he nicked the switch in several places with his knife, so it would bend and crack after the initial blows. Eliza wasn’t deceived. “Go and get another switch,” she instructed him, “and see that it is not slashed this time.”<sup>60</sup>

Eliza must have found the religious atmosphere in Owego suitably wholesome. One of John’s imperishable images of Owego was of standing behind the house and hearing the dutiful Eliza praying aloud in an upstairs bedroom. The local Baptists were enterprising evangelists, and every winter they marched scores of reformed sinners down to the frozen Susquehanna, carved out openings in the ice, and baptized them. Every Sunday, neighbors picked up Eliza and the children and drove them to a Baptist church in the village. Inspired by a Sunday-school class on forgiveness, the children initiated a custom that suggests how religion permeated their lives. Each night, when they got into bed, they turned to their siblings and said, “Do you forgive me all I have done to you today?”<sup>61</sup> By the time they fell asleep, the air had been cleared of all recriminations or festering anger.

In Owego, Eliza increased her dependence on John, as if training him to be everything Bill wasn’t. Like his mother, John seemed stronger without Bill, able to escape his shadow and forge a separate identity. His manifold duties habituated him to a heavy workload. When not attending school, he cut wood, milked the cow, drew well water, tended the garden, and went on shopping expeditions while also supervising his younger siblings in their mother’s absence. “I was taught to do as much business at the age of ten or eleven as it was possible for me to do,” he later noted.<sup>62</sup>

As the stand-in for Bill, he kept a tight rein on the family budget and learned to appraise the world shrewdly. Once he spent three days helping a local farmer dig potatoes for 37

Throughout his life, John D. Rockefeller, Sr., reacted in a vitriolic manner to accusations that he had lusted after money as a child and yearned to be fabulously rich. Doubtless embarrassed, he contested insinuations that he was motivated by greed instead of a humble desire to serve God or humanity. He preferred to portray his fortune as a pleasant accident, the unsought by-product of hard work. Yet stories surface of Rockefeller daydreaming about money in Owego when he was only in his early teens. One day, strolling by the Susquehanna with a friend, he blurted out: “Some day, sometime, when I am a man, I want to be worth a-hundred-thousand-dollars. And I’m going to be, too—some day.”<sup>64</sup> Nearly identical accounts come from so many sources that one is forced to conclude he had conveniently expunged such memories. Given his father’s panting ardor for money, it would have been strange had he *not* been bewitched by gold.

There was nothing unusual about Rockefeller’s boyhood dreams, for the times were feeding avaricious fantasies in millions of susceptible schoolboys. Antebellum America was a place of high adventure and unbounded opportunity for industrious young men. Following the war with Mexico, huge chunks of land—Texas, New Mexico, and upper California—were annexed to the country in early 1848. That same year, gold was discovered at John Sutter’s sawmill in California, triggering a mad westward rush of ninety thousand prospectors. Just as the Rockefellers were moving from Moravia to Owego, hordes of frantic men swarmed across the continent, sailed around South America, or slogged across the Isthmus of Panama, hell-bent to reach California. The pandemonium foreshadowed the petroleum craze in western Pennsylvania a decade later. Though the gold rush proved a snare and

a delusion for most miners, the occasional success stories nonetheless inflamed the popular imagination. Mark Twain singled out the California gold rush as the watershed event that sanctified a new money worship and debased the country's founding ideals.

Before he left Owego, John secured a first-rate education, then a rarity in rural America, where few children attended secondary school. At first, the Rockefeller children went to a schoolhouse a short walk from their house; due to the family's straitened circumstances, a friendly neighbor purchased their textbooks. In August 1852, John and William entered Owego Academy, which had been founded in 1827 and was unquestionably the finest secondary school in that part of New York. Topped by a tall steeple, fenced in by lovely parkland, the three-story brick school building must have awed the still-rustic Rockefeller boys. Presiding over the academy was an able Scot, Dr. William Smythe, who made the students hone their verbal skills by writing fortnightly essays and delivering speeches on assigned themes; the linguistic skills mastered at Owego became evident in Rockefeller's concise business letters. The school produced many eminent graduates, including Thomas C. Platt, later the "Easy Boss" who ran the New York Republican machine, and Washington Gladden, the preacher who issued some of the most scorching screeds directed against Standard Oil.

Many of the 350 pupils came from affluent urban families, and John later lauded this exposure to city boys, saying it was "bound to benefit country boys."<sup>65</sup> The school charged a steep tuition of three dollars per term, suggesting that Bill's medical road show was finally prospering after two years in Owego. John never expressed resentment at being, by academy standards, a poor boy. When a photographer came to shoot class pictures, John and William were excluded because their suits were too shabby. Other boys might have smarted, but John always prized his daguerreotypes of his fellow scholars, later insisting, "I would not part with this collection for any money."<sup>66</sup> In Eliza Rockefeller's household, one didn't morbidly dwell on slights but kept one's sights fixed on the practical goals ahead. John never aspired to popularity at the school. It was as if, after the inordinate attention that his father attracted, John wanted to be quiet and inconspicuous and blend into the crowd.

While many well-to-do students boarded at the school, the Rockefeller boys undertook a three-mile hike to school every morning and, like many students, wandered barefoot down the dusty lanes in warm weather. This long trek led John past fine, imposing homes with well-trimmed lawns facing the Susquehanna River. With his slow, deliberate pace, he often set out early and reflected in an unhurried manner as he walked, his eyes always fixed on the ground ahead. Not averse to taking shortcuts, however, he sometimes sat by the roadside and asked passing teamsters for a lift.

John was a plodding, lackluster student, with no discernible trace of brilliance, and only one aspect of school life truly seemed to intrigue him. Every Saturday, the principal demonstrated the newfangled devices then revolutionizing American business, and John was riveted by displays of a telegraph instrument (invented by Samuel F. B. Morse in 1837), galvanic batteries, and other modern contrivances. Such things captured his mind more than the rousing social issues raised by Harriet Beecher Stowe in *Uncle Tom's Cabin*, which was published in 1852 in horrified response to the Fugitive Slave Law of 1850.

To the extent that the Rockefeller children had difficulties with schoolwork, it stemmed from the chaotic situation at home. For five growing, energetic children, their small cottage was noisy and cramped. Each evening, Eliza packed her brood off to a teenage neighbor named Susan La Monte, who tutored them and ensured that they completed their homework. She remembered William and Frank as typically mischievous boys, kicking and teasing each other, while John was oddly self-possessed, already a boy-man, a model of adult decorum. "I have no recollection of John excelling at anything. I do remember he worked hard at everything; not talking much, and studying with great industry. . . . There was nothing about him to make anybody pay especial attention to him or speculate about his future."<sup>67</sup>

An 1852 photo of the Rockefeller children shows John, age thirteen, William, eleven, and Mary Ann, nine, sitting in the inky gloom of a photo studio. They are a cheerless trio as they stare blankly into the camera. Wearing a plaid suit, and with his hair neatly brushed back from a wide forehead, John has a long, impassive face, and his expression is inscrutable. William has a softer, rounder face, and his garments—including a polka-dotted vest and a watch chain—suggest his father's more outgoing personality. Mary Ann wears the plain dress of a farm girl, her hair in pigtailed and parted down the middle. Although the group portrait suggests middle-class respectability, its somber mood—which also must owe something to the slower photography of the day—discloses something less than the idyllic boyhood John liked to evoke.

The drudgery of daily life was often leavened by play as John had his first chances to flirt with young ladies, and he exhibited flashes of droll wit. One afternoon, at a Sunday picnic—he was perhaps twelve—he passed a group of young ladies seated before heaps of food and observed, "Remember, girls, if you eat slowly, you can eat more!"<sup>68</sup> Rockefeller was intensely aware of the opposite sex yet, knowing of his father's history, kept his impulses under tight control. Susan La Monte saw a sensitivity in the boy that escaped casual observers; she was struck by "his great admiration of beauty. There was a little girl going to school near our home, a pretty little thing named Freer, with red cheeks and bright eyes and a sweet face. In after years Mr. Rockefeller would ask for her, and when she was left a widow in distress he aided her with a modest pension."<sup>69</sup> Susan La Monte saw that the boy's eerie self-discipline concealed a deep fund of emotion, and she remembered the ceremony of grief he went through when one of her sisters died. "On the day she died John came to our house and stretched out on the ground and would not go away. He was so sorry that he would not go away, but lay there all day."<sup>70</sup> Such stories reveal a sensitivity in Rockefeller that would always be there but that would later be studiously concealed behind the polished façade of the hard-driving businessman.

## Bound to Be Rich

As a roving salesman, William Avery Rockefeller was fast becoming a relic of an earlier America when markets were extended not by new methods of communication or transportation but by the salesman simply covering more ground. A magnetic pull lured Big Bill even farther west, away from the burgeoning cities and industries of the eastern seaboard and toward remote hamlets on the American frontier. In early 1853, the Rockefellers were again uprooted and swept along in the whirlwind of Bill's life when he took them by train to a prairie town in Ohio called Strongsville, about a dozen miles southwest of Cleveland. At this juncture, Bill quietly began to distance himself from his dazed family, having formed a new romantic attachment that proved far deeper than earlier infidelities and that finally severed his familial ties.

Where Eliza and the children had at least enjoyed their own homes in Richford, Moravia, and Owego, retaining some modicum of dignity, Bill now dumped them at the home of his sister and brother-in-law, Sara Ann and William Humiston, paying his relatives three hundred dollars a year to board his clan. To his hapless family, this must have seemed, after all their wanderings, terribly unfair. Their lives had always been uncommonly restless, but now they were castoffs, pariahs in a strange new Ohio town, tumbling back down the social ladder they had so arduously climbed.

The six Rockefellers were squashed into a small house with six or seven Humistons, even though Bill seems to have been flush with cash at the time. Years later, Billy Humiston insisted that Devil Bill was considered rich, that he gave out loans at hefty rates, kept three or four fine guns, stocked a rich wardrobe, and sported diamond rings and a gold watch—all of which suggested that the abrupt move to Ohio was less a matter of financial stringency than of personal convenience.<sup>1</sup> The Humistons greatly admired Eliza for her excellent business head and thrifty money management, but enormous tension was bottled up in the overcrowded Humiston household. Billy junior later portrayed his cousins William and Frank as very rowdy and John as a prig. "John was just such a boy as he is a man—sanctimonious and precise."<sup>2</sup> Fortunately for all concerned, the Rockefellers soon moved out and took up residence on a small farm at the edge of Strongsville.

By now Big Bill had relinquished all interest in lumber and other settled trades and had permanently assumed the persona of the rambling doctor or "botanic physician," as he was soon listed in the Cleveland directory. In the first year after he deposited his family in Strongsville, Bill returned only three or four times, but, by a curious fluke, the townspeople learned a good deal about his fraudulent activities on the road. One day, a Strongsville resident, Joe Webster, checked into a hotel in Richfield, Ohio, and was stunned to see a sign in the lobby trumpeting the news, "Dr. William A. Rockefeller, the Celebrated Cancer Specialist, Here for One Day Only. All cases of cancer cured unless too far gone and then can be greatly benefited." Soon after, with the smooth vaudevillian patter employed by so many patent-medicine vendors, Bill collected a crowd outside the hotel. Standing up in his buggy, his sign propped against the wheels, a showman in a silk hat, black frock coat, and dark red beard, he presented himself as Doc Rockefeller and offered full-fledged cancer cures for the extremely steep price of twenty-five dollars; those strapped for cash could purchase cheaper bottles of medicine. When Webster approached him afterward, Bill wasn't abashed and bragged that he had lately been "doctoring" as far afield as Iowa and was buying up land there. After Webster returned to Strongsville and told of his startling discovery, word quickly got around town and everybody thereafter referred to their shadowy, footloose neighbor as Doc Rockefeller—doubtless with some mirth. The moniker stuck.

In the fall of 1853, after eight months in Strongsville, Big Bill decided that the time had come for John and William to resume their educations, so he drove them into Cleveland and settled them as boarders with a Mrs. Woodin on Erie Street, where they paid a dollar a week for room and board. John was penalized by the Cleveland schools because his family had moved around so much. In the sole extant reference to the matter, he wrote in 1923, "I had just come from New York State and recall my humiliation in being obliged to remain one term in the old Clinton Street School—I had been for several years in the Owego Academy . . . and supposed I should go at once into the High School instead of the Grammar School."<sup>3</sup> For this proud boy, the demotion must have been one of many small but wounding indignities suffered during these anxious years.

When John finally entered high school (later called Central High School) in 1854 at the age of fifteen, it was still a modest, one-story affair, shaded by trees and standing behind a clean white picket fence; it would receive a much fancier new building in 1856. Operating on the progressive theory of free education for boys and girls, the school enjoyed a superb reputation. Since it stressed composition, John had to submit essays on four topics to advance to the next grade: "Education," "Freedom," "The Character of St. Patrick," and "Recollections of the Past." At a time when America was deeply split over the question of extending slavery to new territories—the Kansas-Nebraska Act was passed in May 1854—these writings exhibit Rockefeller as a young democrat and confirmed abolitionist. In "Freedom," he branded it a "violation of the laws of our country and the laws of our God that man should hold his fellow man in bondage." Unless slavery was curbed speedily, he prophesied, it "will end in the ruin of our country."<sup>4</sup> America would only progress, he believed, with an educated citizenry. "In former times when learning was confined to the monks and priests, then it was that the world stood still, and it was not until the people were educated and began to think for themselves that it progressed."<sup>5</sup> Such views on abolitionism and universal literacy echoed those of northern Baptist evangelicals who scorned political no less than ecclesiastical despotism. As a self-made man, Rockefeller would always deplore aristocracies and priesthoods as effete, reactionary foes of true progress, defenders of privilege against enterprising commoners.

Rockefeller expressed himself with great clarity and precision. (Schoolmates called him "John D." because he signed his essays this way.) He also excelled as a debater, demonstrating that beneath his reserved manner he could articulate his thoughts forcefully. He began one speech with the line "I'm pleased although I'm sad," and this gambit so tickled his fellow students that they nicknamed him "Old Pleased-Although-I'm-Sad."<sup>6</sup> He bore another, equally doleful nickname, "the Deacon," and it says much about his preferences that he actually *liked* this sobriquet. As his future sister-in-law, Lucy Spelman, said, "He was a studious boy, grave, reserved, never noisy or given to boisterous play."<sup>7</sup> Rockefeller frequently hugged his slate to his chest, a pose that hinted at his guarded nature.

However private or solitary, John D. always had his quota of friends. One close chum was Mark Hanna, the descendant of well-to-do grocers and commodity brokers and later a U.S. senator and Republican Party boss. Another friend, Darwin Jones, who formed a boyhood triumvirate with them,

recalled the sharply etched contrast between Hanna and Rockefeller. “Mark was of the virile type, always active and took part in almost all forms of athletics, while John Rockefeller was reserved, studious, though always pleasant. No matter what the excitement, John retained his quietude and smiled on all occasions.”<sup>8</sup> In future years, Rockefeller cringed when Mark Hanna was quoted posthumously as describing him as “sane in every respect save one—he is money mad!”<sup>9</sup> As at Owego Academy, classmates in Cleveland remembered Rockefeller voicing the fervent wish to be worth a hundred thousand dollars someday.

John’s boyhood gravity pleased many adults but unsettled others, who found something queer and unnatural about him. One high-school teacher described him, with patent distaste, as “the coldest blooded, the quietest and most deliberate chap.”<sup>10</sup> Even as a teenager, Rockefeller demanded to be treated with adult dignity. In recollecting the school principal, Dr. Emerson E. White, Rockefeller mentioned only his behavior toward him: “Mr. White was a gentleman. He treated me like a gentleman—and treated all the boys so.”<sup>11</sup> Rockefeller was sensitive about adults who behaved in a high-handed fashion toward him. Having assumed so much responsibility at home, he now thought of himself as a mature person. Bill had set him up with his own bank account, and his life was far more independent than those of his classmates.

This tough, self-possessed boy had no tincture of rebellion in his makeup. Seeing his education solely in utilitarian terms, he studied hard but showed no intellectual playfulness. “I was very sedate and earnest,” he said, “preparing to meet the responsibilities of life.”<sup>12</sup> Once again, he displayed a fantastic mind for numbers. “Arithmetical problems most attracted him,” said Lucy Spelman, “for he had been taught at home to keep accurate account of his gains and losses.”<sup>13</sup>

Perhaps the most surprising dimension of John D.’s early adolescence was his deep absorption in music. He even briefly aspired to be a musician and practiced the piano for up to six hours a day, driving Eliza mad with the racket while they still lived in Owego. The piano was then the symbol of a decorous middle-class home and his playing might have hinted at his genteel aspirations. For a man who would distrust other art forms as vaguely subversive, encouraging ungovernable emotions and pagan sensuality, music provided him with an artistic medium that he could wholeheartedly enjoy with church approval.

For the teenage boy, Mrs. Woodin’s boardinghouse was an education in itself. Her daughter, Martha, was several years older than John and William, and they engaged in lively, heated discussions on many topics, with the bright, outspoken Mrs. Woodin often joining in. The most controversial topic was lending money at interest. In an extremely peculiar arrangement, John, age fifteen, was already lending small sums to his father at interest; never sentimental when it came to business, he simply charged his father what the traffic would bear—a practice Bill probably applauded enthusiastically. According to Rockefeller, Mrs. Woodin was “violently opposed to loaners obtaining high rates of interest, and we had frequent and earnest arguments on the subject.”<sup>14</sup> It was typical of Rockefeller that this question of business method and morality occupied his attention far more than the esoteric matters found in schoolbooks.

As if embarrassed by his peripatetic family life, Rockefeller tended to oversimplify the chronology of his early years, especially when speaking of his adolescence. After a year in Strongsville, John claimed, his family moved to Parma, about seven miles south of Cleveland, then into their own house in Cleveland proper. In fact, he omitted a critical two-step Cleveland detour before the shift to Parma, as can be gleaned from a revealing anecdote told by his school principal, Dr. White: “One day in 1854 a tall, angular boy came to me and said that his widowed mother and two sisters were coming to Cleveland to live and he wished my help in finding a temporary home for them.” The good-natured White invited the Rockefellers to move in with him and his new bride, and John “liked the idea and always insisted that it was a happy time for his mother.”<sup>15</sup>

Two words leap from the story—*widowed mother*. It seems of some psychological significance that the first recorded instance of Rockefeller’s capacity to lie came in an effort to hush up his father’s existence—in fact, to bury him alive. Since Bill popped up in Cleveland three or four times a year, it took a certain cheek for his son to invent this story. The small episode acquires added interest when one notes that more than thirty years later, when Eliza died before Bill did, John instructed the preacher to describe her as a widow at the funeral. Further, despite the principal’s gracious response, it must have been perfectly dreadful for John, as a teenager, to go on a begging mission to find temporary lodgings for his family.

When Bill reappeared, he moved his family to a house on Perry Street in downtown Cleveland, rented from a Mr. O. J. Hodge, who remembered John as “an unassuming youth who showed none of the hilarity often seen in boys of that age. Usually he sat quietly in his chair listening to what was being said.”<sup>16</sup> As had been true since the Richford days, Bill was scrupulous about making timely rent payments. “Never was rent—\$200 for a year—paid more promptly, nor did I have in all respects a better tenant,” said the landlord.<sup>17</sup> Before the year was out, Bill had resettled his family on a ten-acre, creek-side farm in Parma while John returned to Mrs. Woodin, who had relocated first to Saint Clair Street and then to Hamilton Street.

A contemporary photo of John with his two sisters and two brothers, all of them unsmiling, is again drenched in a mortuary gloom. Now a tall, thin boy who weighed about 140 pounds, John had tidily brushed light brown hair and clothes that were always clean and presentable. He later laughed at his solemn boyhood demeanor: “From fourteen years of age to twenty-five I was much more dignified than I am now,” he said with truth in his seventies.<sup>18</sup> In Strongsville and Parma, Eliza fretted about the ubiquitous taverns in town and worked hard to shield her children from illicit entertainments. She must have been especially alarmed as her eldest son approached that perilous rite of passage, first love. Interestingly, John D. reenacted his father’s penchant for dalliances with the domestic help. In Strongsville, Eliza hired a household assistant, a pretty young farmer’s daughter named Melinda Miller, who did chores for the family and shared their meals. When the Rockefellers moved to Parma, Melinda resumed working for them, and John, a year younger than she, often came out from Cleveland to take walks with her. Rumors soon drifted about town that John had taken away the girl’s virginity. Whatever the truth, the Millers raised an unholy ruckus about the romance. In one of the less prophetic judgments in parental history, they argued that they didn’t want their daughter to throw herself away on a young man with such poor prospects. According to legend, one of Melinda’s parents came to fetch her by buggy to break up the liaison. Eventually, she married young Joe Webster, whose father had discovered Big Bill’s doctor act.<sup>19</sup> From the standpoint of Rockefeller’s career, the failure of this relationship was fortunate, for he ended up with a woman of much greater social standing and intellectual attainment, who would provide him with the strong, stable home life and religious certitude that he craved.

At this point, we need to sketch in some events in William Avery Rockefeller's life in the early 1850s, for his behavior began to shade over from the eccentric to the quasi-pathological. A man of multiple disguises, he had always been fond of assuming names; even when he first arrived in Richford, he had told some people that his name was Rockafellow. During the Owego years, Bill occasionally appeared in surrounding towns and presented himself as an eye-and-ear specialist named Dr. William Levingston. We know now that by the time he transplanted his family to Ohio, he was leading a full-blown double life as both Dr. William A. Rockefeller and Dr. William Levingston, the latter name appropriated from the town of his father's birth, Livingston, New York. While this second name probably began as a simple alias to shield his family from his shady practices, it hardened in the early 1850s into a separate identity away from home. Bill's traveling partner in his later years attributed Bill's use of the pseudonym to the fact that he was practicing medicine without a license or diploma and always feared retribution from indignant local doctors, who instigated legal proceedings against him on several occasions.<sup>20</sup>

In the last gasp of his lumber career, Bill had ventured north into Canada in the early 1850s, buying up fine walnut and ash and selling it at a handsome profit to timber mills. After he moved to the town of Niagara, Ontario (almost certainly without his family's knowledge), he began to canvass the surrounding countryside as a traveling doctor. "Dr. Levingston" was a blatant quack, but he partially believed his own bombast and had enough success stories to deceive his patients and perhaps even himself. As his future partner said, "He had not studied medicine in any college. But he was a natural healer and had great skill. He had great fame in Canada and northern New York."<sup>21</sup>

Devil Bill had an unerring instinct for spotting those pretty, docile, long-suffering women who would patiently endure his escapades. Around 1852, with his oblivious family still in Owego, he met a lovely, gentle teenage girl in Norwich, Ontario, named Margaret Allen. Bill was then forty-two and Margaret about seventeen, or only four years older than John D. By a small oversight, Dr. Levingston neglected to mention his other life as Doc Rockefeller, to say nothing of his wife and five children, and he wooed Margaret like a lusty bachelor. Bill was an expert confidence man, and Margaret's trusting family was totally fooled. "He was a steady, temperate man of good habits, kind hearted, sociable and well liked by everybody," said Margaret's sister of this jolly wooer. "He was a famous marksman and loved to hunt. He was fond of a good story."<sup>22</sup> Doc Levingston was clearly more popular with the Allens than Doc Rockefeller had been with the Davisons, and Bill was tempted to start afresh with an adoring, innocent young woman, supported by a friendly family. On June 12, 1855, he married Margaret Allen in Nichols, New York, just south of Owego, and started a clandestine life as a bigamist that would persist for the rest of his days.

One can plausibly argue that every time Bill moved his family to another town, it related to his secret philandering, and that he probably relocated his family in Cleveland because Ontario lay just across Lake Erie. True to his earlier behavior, Bill didn't take up permanent residence with Margaret at first. To initiate her into his capricious ways, he started out by visiting her in Ontario once a year and staying with her credulous family. He didn't plan, at the outset, to desert his original family, and for a time in the 1850s Bill continued to tread a tightrope between his old and new wives, neither of whom knew of the existence of the other.

It seems likely that Bill's second marriage had immediate repercussions in the life of his oldest son. All along John had planned to attend college, with Eliza fortifying his resolve in the hope that he would someday become a Baptist minister. Then he received a letter from his father that dispelled his dreams. As he recalled, "My father . . . conveyed an intimation that I was not to go [to college]. I felt at once that I must get to work, find a situation somewhere."<sup>23</sup> Rockefeller never clarified why he dropped out of high school around May 1855, just two months shy of commencement exercises on July 16, but Bill's second marriage on June 12 supplies the missing piece of the puzzle. About to enter into his second marriage, Bill must have been drastically scaling back on firstfamily expenditures, albeit without disclosing the reason for the sudden urgency. As John said, "There were younger brothers and sisters to educate and it seemed wise for me to go into business."<sup>24</sup> Bill was eager to groom his eldest son as the surrogate father who would care for Eliza during his longer absences.

Never a great believer in book learning, Bill probably derided a college degree as a costly indulgence at a time when people didn't equate it with enhanced income. Young men on the make were more likely to attend so-called business colleges or to take correspondence courses to supplement their education. Following his father's suggestion, John paid forty dollars for a three-month course of study at E. G. Folsom's Commercial College, a chain college with branches in seven cities. The Cleveland branch occupied the top floor of the Rouse Building, the town's premier office building, which overlooked the Public Square. It taught double-entry bookkeeping, clear penmanship, and the essentials of banking, exchange, and commercial law—the sort of purposeful courses that appealed to John. By the time his studies ended in the summer of 1855, he had turned sixteen and was ready to flee the traumas of his family life by focusing his energies on a promising business situation.

Perhaps no job search in American history has been so mythologized as that begun by sixteen-year-old John D. Rockefeller in the sweltering Cleveland of August 1855. Although he was a rural boy, his family hadn't been full-time farmers, and this must have made it easier for him to escape from his small-town, agricultural past and enter the new market economy. Though times were tough, the boy set out with no modest ambition as he pored over the city directory, identifying those establishments with high credit ratings. Already endowed with instinctive respect for big business, he knew exactly what he wanted. "I went to the railroads, to the banks, to the wholesale merchants," he later said. "I did not go to any small establishments. I did not guess what it would be, but I was after something big."<sup>25</sup> Most of the businesses he visited lay in a bustling area known as the Flats, where the Cuyahoga River twisted through a clanging, roaring landscape of lumber mills, iron foundries, warehouses, and shipyards before emptying into Lake Erie, which was crowded with side-wheel steamboats and schooners. His quest had a touch of callow grandiosity. At each firm, he asked to speak to the top man—who was usually unavailable—then got straight to the point with an assistant: "I understand bookkeeping, and I'd like to get work."<sup>26</sup>

Despite incessant disappointment, he doggedly pursued a position. Each morning, he left his boardinghouse at eight o'clock, clothed in a dark suit with a high collar and black tie, to make his rounds of appointed firms. This grimly determined trek went on each day—six days a week for six consecutive weeks—until late in the afternoon. The streets were so hot and hard that he grew footsore from pacing them. His perseverance surely owed something to his desire to end his reliance upon his fickle father. At one point, Bill suggested that if John didn't find work he might have to return to the country; the thought of such dependence upon his father made "a cold chill" run down his spine, Rockefeller later said.<sup>27</sup> Because he approached his job hunt devoid of any doubt or self-pity, he could stare down all discouragement. "I was working every day at my business—the business of looking for

work. I put in my full time at this every day.”<sup>28</sup> He was a confirmed exponent of positive thinking.

With almost thirty thousand inhabitants, Cleveland was a boomtown that would have thrilled any young man avid for business experience. It had drawn many transplants from New England who had brought along the Puritan mores and Yankee trading culture of their old hometowns. While the streets were largely unpaved and the town lacked a sewage system, Cleveland was expanding rapidly, with immigrants pouring in from Germany and England as well as the eastern seaboard. The plenty of the Midwest passed through this commercial crossroads of the Western Reserve: coal from Pennsylvania and West Virginia, iron ore from around Lake Superior, salt from Michigan, grain and corn from the plains states. As a port on Lake Erie and the Ohio Canal, Cleveland was a natural hub for transportation networks. When the Cleveland, Columbus and Cincinnati Railroad arrived in 1851, it created excellent opportunities for transport by both water and rail, and nobody would more brilliantly exploit these options than John D. Rockefeller.

For all the thriving waterfront commerce, the job prospects were momentarily bleak. “No one wanted a boy, and very few showed any overwhelming anxiety to talk with me on the subject,” said Rockefeller.<sup>29</sup> When he exhausted his list, he simply started over from the top and visited several firms two or three times. Another boy might have been crestfallen, but Rockefeller was the sort of stubborn person who only grew more determined with rejection.

Then, on the morning of September 26, 1855, he walked into the offices of Hewitt and Tuttle, commission merchants and produce shippers on Merwin Street. He was interviewed by Henry B. Tuttle, the junior partner, who needed help with the books and asked him to return after lunch. Ecstatic, Rockefeller walked with restraint from the office, but when he got downstairs and rounded the corner, he skipped down the street with pure joy. Even as an elderly man, he saw the moment as endowed with high drama: “All my future seemed to hinge on that day; and I often tremble when I ask myself the question: ‘What if I had not got the job?’”<sup>30</sup> In a “fever of anxiety,” Rockefeller waited until the noon-day meal was over, then returned to the office, where he was interviewed by senior partner Isaac L. Hewitt. Owner of a good deal of Cleveland real estate and a founder of the Cleveland Iron Mining Company, Hewitt must have seemed a mighty capitalist indeed. After scrutinizing the boy’s penmanship, he declared, “We’ll give you a chance.”<sup>31</sup> They were evidently in urgent need of an assistant bookkeeper, since they told Rockefeller to hang up his coat and go straight to work, without any mention of wages. In those days, it wasn’t unusual for an adolescent to serve an unpaid apprenticeship, and it was three months before John received his first humble, retroactive pay. For the rest of his life, he would honor September 26 as “Job Day” and celebrate it with more genuine brio than his birthday. One is tempted to say that his real life began on that day, that he was born again in business as he would be in the Erie Street Baptist Mission Church. All the latent dynamism that had been dormant during his country youth would now quicken into robust, startling life in the business world. He was finally liberated from Big Bill, the endless flight from town to town, the whole crazy upside-down world of his boyhood.

Poised on a high stool, bent over musty ledger books at Hewitt and Tuttle, the new clerk could gaze from the window and watch the busy wharves or canal barges drifting by on the Cuyahoga River a block away. Though his day began at dawn, in an office lit dimly by whale-oil lamps, this mercantile world never struck him as arid or boring but “was delightful to me—all the method and system of the office.”<sup>32</sup> Work enchanted him, work liberated him, work supplied him with a new identity. “My duties were vastly more interesting than those of an office boy in a large house today,” he later said.<sup>33</sup> The mature Rockefeller liked to dub himself “just a man of figures,” and he found nothing dry or soporific about the tall ledgers.<sup>34</sup> Having helped Eliza keep the books, he enjoyed a head start. “As I began my life as a bookkeeper, I learned to have great respect for figures and facts, no matter how small they were. . . . I had a passion for detail which afterward I was forced to strive to modify.”<sup>35</sup>

Business historians and sociologists have stressed the centrality of accounting to capitalist enterprise. In *The Protestant Ethic and the Spirit of Capitalism*, Max Weber identified “rational bookkeeping” as integral to capitalism’s spirit and organization.<sup>36</sup> For Joseph Schumpeter, capitalism “turns the unit of money into a tool of rational cost-profit calculations, of which the towering monument is double-entry bookkeeping.”<sup>37</sup> It thus seems fitting that John D. Rockefeller, the archetypal capitalist, betrayed a special affinity for accounting and an almost mystic faith in numbers. For Rockefeller, ledgers were sacred books that guided decisions and saved one from fallible emotion. They gauged performance, exposed fraud, and ferreted out hidden inefficiencies. In an imprecise world, they rooted things in a solid empirical reality. As he chided slipshod rivals, “Many of the brightest kept their books in such a way that they did not actually know when they were making money on a certain operation and when they were losing.”

When Hewitt and Tuttle assigned Rockefeller to pay the bills, he went at this task with an undisguised zeal, a precocious virtuosity, and “attended [to it] with more responsibility than the spending of my own funds.”<sup>38</sup> He closely reviewed the bills, confirming the validity of each item and carefully adding up the totals. He pounced on errors of even a few cents and reacted with scornful amazement when the boss next door handed his clerk a lengthy, unexamined plumbing bill and blithely said, “Please pay this bill.”<sup>39</sup> Rockefeller was appalled by such cavalier indifference, having just caught the same firm in an overcharge of several cents. One suspects that this stickler for detail taught Hewitt and Tuttle a thing or two about economy. “I recall that there was one captain who was always putting in claims for damages to shipments and I decided to investigate. I examined all the invoices, bills of lading and other documents and found this captain had presented entirely unwarranted claims. He never did it again.”<sup>40</sup> In all probability, the boy’s orderly nature reflected a need to govern potentially unruly emotions, an exaggerated reaction to his disorderly father and helter-skelter childhood.

Besides writing letters, keeping books, and paying bills, young Rockefeller also served as a one-man collection agency for Hewitt’s rental properties. Although patient and polite, he displayed a bulldog tenacity that took people by surprise. Sitting outside in his buggy, pale and patient as an undertaker, he would wait until the debtor capitulated. He dunned people as if his life depended upon it, an experience apparently laced with considerable anxiety. “How many times I have dreamed now and then up to recent years that I was trying to collect those bills!” he marveled fifty years later. “I would wake up exclaiming: ‘I can’t collect So-and-So’s account!’”<sup>41</sup> One explanation for his anxiety is that his flight from his distressing family life was still tenuous, and failure at work would mean reverting to reliance on his father. Another explanation is that while he was persistent, he was also extremely slow; as at school, some people thought him a rather dim-witted dolt who would never rise in the world, and he had to prove himself to naysayers.

However modest an operation, Hewitt and Tuttle was an excellent training ground for an aspiring young businessman, for it exposed Rockefeller to a broad commercial universe. Before the Civil War, most businesses still confined themselves to a single service or product. Hewitt and Tuttle, in contrast, traded a wide array of commodities on commission. Though it had started out dealing in foodstuffs, it had pioneered in importing iron ore from Lake Superior three years before Rockefeller was hired. The firm relied upon the railroad and the telegraph, the two technologies then revolutionizing

the American economy. As Rockefeller remarked, “My eyes were opened to the business of transportation”—no small thing, given Standard Oil’s subsequent controversial relations with the railroads.<sup>42</sup> Even a simple consignment of Vermont marble to Cleveland required complex calculations of the relative costs of railroad, canal, and lake transportation. “The cost of losses or damage had to be somehow fixed between these three different carriers, and it taxed all the ingenuity of a boy of 17 to work out this problem to the satisfaction of all concerned, including my employers.”<sup>43</sup> No business experience was ever wasted upon Rockefeller.

On the last day of 1855, Hewitt handed Rockefeller \$50 for three months of work, or slightly more than 50 cents a day. Effective immediately, Hewitt announced, the assistant bookkeeper would have his wages boosted sharply to \$25 a month or \$300 per year. Oddly, Rockefeller felt guilty about the raise: “I felt like a criminal.”<sup>44</sup> Again, one has a hunch that he was jubilant but feared, out of religious scruples, his own greed. Accumulating money was one thing, Rockefeller knew, but outwardly coveting it was another.

In many ways, John D. Rockefeller exemplified the enterprising young businessman of his era. Thrifty, punctual, industrious, he was a fervent adherent of the gospel of success. He could have been the hero of any of the 119 inspirational tracts soon to be penned by Horatio Alger, Jr., books that bore such sonorous titles as *Strive and Succeed*, *Luck and Pluck*, *Brave and Bold*, and *Bound to Rise*. This last title, in fact, echoed Rockefeller’s ecstatic boast to an older businessman one day: “I am bound to be rich—bound to be rich—BOUND TO BE RICH!” He was said to have punctuated this refrain by several smart, emphatic whacks on his companion’s knee.<sup>45</sup> And John D. didn’t become demonstrative about too many topics.

Though Rockefeller steadfastly denied these stories of his boyhood obsession with money, he related the following story of his time at Hewitt and Tuttle:

*I was a young man when I got my first look at a banknote of any size. I was clerking at the time down on the Flats here. One day my employer received a note from a down-State bank for \$4,000. He showed it to me in the course of the day’s business, and then put it in the safe. As soon as he was gone I unlocked the safe, and taking out that note, stared at it with open eyes and mouth, and then replaced it and double-locked the safe. It seemed like an awfully large sum to me, an unheard of amount, and many times during the day did I open that safe to gaze longingly at the note.*<sup>46</sup>

In this story, one can almost feel the erotic charge that the banknote aroused in the boy, the way it cast a hypnotic trance over him. One is reminded of how Big Bill bundled his bills, stored them away, then enjoyed peeking at his hidden treasure. This lusting after money is the more striking in a phlegmatic young man who claimed never to struggle with disruptive impulses. “I never had a craving for tobacco, or tea and coffee,” he once stated flatly. “I never had a craving for anything.”<sup>47</sup>

If motivated by greed more than he ever cared to admit, Rockefeller also derived a glandular pleasure from work and never found it cheerless drudgery. In fact, the business world entranced him as a fount of inexhaustible wonders. “It is by no means for money alone that these active-minded men labor—they are engaged in a fascinating occupation,” he wrote in his memoirs, published in 1908–1909. “The zest of the work is maintained by something better than the mere accumulation of money.”<sup>48</sup>

Because American culture encouraged—nay, glorified—acquisitive behavior, there was always the possibility that it might be taken to extremes and people would end up enslaved by their greed. As a result, children were taught to monitor and supervise their behavior. In his posthumously published *Autobiography*, Benjamin Franklin describes how he drew up a little moral ledger that allowed him, at a glance, to track his virtues and vices every day. Many people in the mid-nineteenth century kept such journals to enforce thrift and also objectify their moral performance. Adolescents kept diaries larded with pep talks, exhortations, inspirations, and warnings. Andrew Carnegie wrote hortatory memos to himself, while William C. Whitney kept a small notebook of little homilies. A contradictory impulse was at work: People were spurring themselves to excel but also trying to curb their insatiable appetites in the new competitive economy.

John D. Rockefeller took such internal monitoring to an advanced stage. Like a good Puritan, he scrutinized his daily activities and regulated his desires, hoping to banish spontaneity and unpredictability from his life. Whenever his ambition was about to devour him, his conscience urged restraint. Since he worked a long day at Hewitt and Tuttle, business threatened to become an overwhelming compulsion. Starting work each day at 6:30 A.M., he brought a box lunch to the office and often returned after dinner, staying late. One day he decided to throttle this obsession. “I have this day covenanted with myself not to be seen in [the office] after 10 o’clock P.M. within 30 days,” he wrote to himself.<sup>49</sup> It is telling that the young man made such a pledge to himself and equally revealing that he found it impossible to obey.

No less than his business life, Rockefeller’s private life was ruled by bookkeeping entries. Since he found numbers so clean and soothing in their simplicity, he applied the business principles of Hewitt and Tuttle to his own personal economy. When he started working in September 1855, he paid a dime for a small red book, anointed Ledger A, in which he minutely recorded his receipts and expenditures. Many of his young contemporaries kept such record books but seldom with such exacting care. For the remainder of his life, Rockefeller treated Ledger A as his most sacred relic. Producing it before Bible classes more than fifty years later, he became almost tearful and trembled as he thumbed its pages, so potent were the emotions it evoked. At a Bible class of the Fifth Avenue Baptist Church in 1897, a deeply moved Rockefeller held the book aloft and intoned, “I haven’t seen this book for twenty-five years. You couldn’t get it from me for all the modern ledgers in New York and what they all would bring in.”<sup>50</sup> The book rested in a safety-deposit vault, like some priceless heirloom.

As Ledger A confirms, Rockefeller was now self-supporting and entirely free of his father, spending half his income for his lodging with Mrs. Woodin and for a washerwoman. He took pride in memories of this threadbare adolescence. “I could not secure the most fashionable cut of clothing. I remember I bought mine then from a cheap clothier. He sold me clothing cheap such as I could pay for and it was a great deal better than buying clothes I could not pay for.”<sup>51</sup> He was long puzzled by one lapse from strict economy: He bought a pair of fur gloves for \$2.50 to replace his customary woolen mittens and, at age ninety, was still clucking his tongue over this shocking extravagance. “No, I can’t say to this day what caused me to waste that \$2.50 on regular gloves.”<sup>52</sup> Another expense pregnant with interest for the mature Rockefeller was his purchase of an illuminant called camphene for eighty-eight cents per gallon. Thanks to massive economies of scale, Standard Oil eventually sold a superior illuminant, kerosene, for five cents a gallon—

something Rockefeller was wont to recall when people later accused him of gouging the populace.

In one critical respect, Rockefeller didn't exaggerate the value of Ledger A, for it spoke authoritatively to the question of whether he was a rapacious man who later misused charity to cleanse a "tainted" fortune. Here Ledger A speaks with a firm and unequivocal voice: Rockefeller was fantastically charitable from boyhood. During his first year on the job, the young clerk donated about 6 percent of his wages to charity, some weeks much more. "I have my earliest ledger and when I was only making a dollar a day I was giving five, ten, or twenty-five cents to all these objects," he observed.<sup>53</sup> He gave to the Five Points Mission in a notorious lower Manhattan slum, as well as to "a poor man in church" and "a poor woman in church."<sup>54</sup> By 1859, when he was twenty, his charitable giving surpassed the 10 percent mark. Despite a pronounced tilt toward Baptist causes, he gave early hints of an ecumenical bent, contributing money to a black man in Cincinnati in 1859 so he could buy his wife out of slavery. The next year, he gave to a black church, a Methodist church, and a Catholic orphanage.

The clerk's philanthropic gifts were as salient as his business talents. It testifies to Rockefeller's deeply paradoxical nature that he was smitten by a \$4,000 banknote but equally entranced by an 1855 book entitled *Extracts from the Diary and Correspondence of the Late Amos Lawrence*. A wealthy New England textile manufacturer, Lawrence gave away more than \$100,000 in a planned, thoughtful fashion. "I remember how fascinated I was with his letters," said Rockefeller, who might have gotten from Lawrence his later habit of handing out freshly minted money to people. "Crisp bills! I could see and hear them. I made up my mind that, if I could manage it, some day I would give away crisp bills, too."<sup>55</sup> However rare and admirable such thoughts are in a teenage boy, we must note that it was again a case of money exerting a magical effect upon his mind. He saw that money could bring majesty in the moral as well as secular sphere, which excited him more than fancy estates or clothes.

As if he knew he would someday be rich and had to prepare for the appointed hour, the assistant bookkeeper became a perceptive observer of the businessmen around the port and noted their avoidance of ostentation. For instance, he tremendously admired a shipping merchant named L. R. Morris and was struck "by the way he walked, the way he looked, quite unaffected by his great riches. I saw other wealthy men, and I was glad to see that they went about their business without any display of power or money. Later I saw some who wore rich jewels and luxurious clothes. It seemed unfortunate that they were led into such lavish style." If Rockefeller kept to a Quakerish sobriety of dress and later resisted the vulgar display of the Vanderbilts and other Gilded Age moguls, with their elaborate mansions and yachts, it had something to do with his Baptist beliefs, but also with the plain, understated style of the wealthy Cleveland businessmen he studied so attentively at a formative stage of his life.

Like innumerable young people before him, Rockefeller turned to the church for all-encompassing answers to intractable family problems. He possessed a sense of calling in both religion and business, with Christianity and capitalism forming the twin pillars of his life. While Charles Darwin's *Origin of Species* began to chip away at many people's faith after it was published in 1859, Rockefeller's religion remained of the simple, undeviating sort. When challenges to orthodoxy arose in later decades, he stuck by the spiritual certainties of his boyhood. Because of his father's often unscrupulous behavior, the young clerk was ripe for fiery denunciations of sin and the talk of personal salvation and moral reformation that were then staples of Baptist discourse. From the beginning, his Baptist faith served as a powerful instrument to control forbidden feelings and check his father's unruly nature within him. After the constant flux of his childhood, he yearned to be rooted in a church that would act as his substitute family but without the shameful aspects of his real one.

While John and William boarded with Mrs. Woodin and her daughter, Martha, the four of them began to attend a poor, struggling church nearby called the Erie Street Baptist Mission Church. Organized three years earlier by the well-heeled First Baptist Church, the mission church was a spare white building with a belfry and tall narrow windows, standing in a flat, treeless space. Several religious revivals had rolled through Cleveland in the 1850s, and the Erie Street Baptist Mission Church was created in the aftermath of a revival meeting that lasted 150 consecutive nights.

The church gave Rockefeller the community of friends he craved and the respect and affection he needed. Having studied in Deacon Alexander Sked's Bible class, Rockefeller was recruited to the church by Sked, a florist by trade, a poetical Scot who loved to spout psalms and prophecies and seemed to know the whole Bible by heart. Born in Scotland in 1780, Sked arrived in America in 1831 and moved to Cleveland four years later. During services, he would lift his hands in supplication to God, his face shining with fervor. This pious, elderly man served as a mentor to Rockefeller, who sought him out to report the good news when he got his job at Hewitt and Tuttle, an encounter that produced an unexpected snub that Rockefeller never forgot. "Before I went away, he remarked that he liked me pretty well, but that he had always liked my brother William better. I could never think why he said that. I did not hold it against him, but it puzzled me."<sup>56</sup>

In the fall of 1854, after making a personal confession of faith, John was immersed in the baptismal basin by Deacon Sked and became a full-fledged church member. Never a snob, Rockefeller was proud of being "brought up in a mission church."<sup>57</sup> Notwithstanding his worldly ambition, he didn't seek social shortcuts to success by joining a prosperous congregation or a high-church denomination. As a loner and outsider, he was drawn by the warm fellowship of the faithful and liked the egalitarian atmosphere of the Erie Street church, which gave him the opportunity to associate, as he put it, with "people in the most humble of circumstances."<sup>58</sup> A central tenet of Baptism is the autonomy of individual congregations, and the mission churches, which weren't dominated by established families, were the most democratic of all. The Erie Street church was populated by salesmen, shop assistants, railroad conductors, factory workers, clerks, artisans, and others of extremely modest means. Even in its later, fancier incarnation as the Euclid Avenue Baptist Church, the membership remained more plebeian than patrician. In his later years, Rockefeller declared, with heartfelt warmth, "How grateful I am that these associations were given to me in my early boyhood, that I was contented and happy with . . . the work in the church, with the work in the Sunday school, with the work with good people—that was my environment, and I thank God for it!"<sup>59</sup>

Instead of merely attending services, Rockefeller performed numberless tasks in the church. While still in his teens, he became a Sunday-school teacher, a trustee, and an unpaid clerk who kept the board minutes in his own hand. Free of false pride, he delighted even in menial chores, and one woman in the congregation left this vivid vignette of his ubiquitous presence:

*In those years . . . Rockefeller might have been found there any Sunday sweeping out the halls, building a fire, lighting the lamps, cleaning the walks, ushering the people to their seats, studying the bible, praying, singing, performing all the duties of an unselfish and thorough going church*

*member. . . . He was nothing but a clerk, and had little money, and yet he gave something to every organization in the little, old church. He was always very precise about it. If he said that he would give fifteen cents, not a living soul could move him to give a penny more, or a penny less. . . . He studied his Bible regularly and diligently, and he knew what was in it.* <sup>60</sup>

One notes his proprietary feeling about the church, how lovingly he tended it. In some respects, he acted as a volunteer janitor, sweeping the austere chapel, washing the windows, replenishing the candles in wall sconces or stoking the corner base burner with wood. On Sundays, he rang the bell to summon people to prayer and kindled the fire and then, to economize, snuffed out all the candles save one as people filed from the service. “Save when you can and not when you have to,” he instructed others and urged them to wear their good Sunday clothing to work as a sign of their Christian pride.<sup>61</sup> Besides Friday evening prayer meetings, he went to services twice on Sunday and was always a conspicuous figure in a straight-backed pew, kneeling and leading the congregation in prayer. He prized the special intensity of feeling that Baptists brought to their faith, which provided an emotional release lacking elsewhere in his life. With a ripe baritone voice, refined by singing lessons at church, he boomed out hymns with deep joy. His favorite, “I’ve Found a Friend,” portrayed Jesus in tenderly familiar terms: “I’ve found a Friend; oh, such a Friend! / He bled, he died to save me.”<sup>62</sup>

In a world full of snares to entrap the unsuspecting pilgrim, Rockefeller tried hard to insulate himself from all temptation. As he later saw it, “a boy must ever be careful to avoid the temptations which beset him, to select carefully his associates and give attention as well to his spiritual and . . . mental and material interests.”<sup>63</sup> Since evangelicals abstained from dancing, cards, and theater, Rockefeller restricted his private life to church socials and picnics, where he could play blindman’s buff and engage in other innocent pastimes. As a model Baptist, he was sought after by the young ladies. “The girls all liked John immensely,” said one congregant. “Some of them came dangerously near to being in love with him. He was not especially attractive in his person and his clothes were strenuously plain and well worn. He was thought much of by these spiritual minded young women because of his goodness, his religious fervor, his earnestness and willingness in the church, and his apparent sincerity and honesty of purpose.”<sup>64</sup>

Over lemonade and cake at church socials, Rockefeller developed a close attachment to a pretty young woman named Emma Saunders, who chafed that John wouldn’t broaden his social activities and insisted upon confining their dating to the church. For Rockefeller, the church was more than a set of theological positions: It was a fellowship of virtuous, like-minded people, and he always hesitated to stray too far from its protective embrace.

Though generally reserved, Rockefeller developed convivial habits in church that lingered for life, and it bothered him when people marched off right after the Sunday service. “There ought to be something that makes the church homelike,” he insisted. “Friends should be glad to see each other and to greet strangers.”<sup>65</sup> Even in later years, when huge swarms of people congregated at the church door to glimpse the world’s richest man, he would still clasp people’s hands and bask in the glow of familial warmth. The handshake acquired symbolic meaning for him, for it was “the friendly hand extended to the man who doesn’t know that he is wanted [that] brings many a one into the church. This early feeling about handshaking has stayed with me. All my life, I have enjoyed this thing that says: ‘I am your friend.’”<sup>66</sup>

Just as Rockefeller was sensitive to condescending treatment in the business world, he couldn’t stand it in the religious realm either. Since mission churches weren’t self-financing, Rockefeller and other trustees had to submit to patronizing advice from the mother church. “This strengthened our resolve to show them that we could paddle our own canoe.” <sup>67</sup> While Rockefeller’s religious faith ran strong, he was most involved in the temporal affairs of the church, which he thought should be run like a tidy business. He soon had a chance to defend the church’s solvency when it fell behind on interest payments on a \$2,000 mortgage held by a deacon. One Sunday, the pastor announced from the pulpit that this creditor threatened to foreclose on the church and that they had to raise \$2,000 very fast to survive. As the stunned congregation filed out, they found Rockefeller stationed at the door, buttonholing people and asking them to pledge specific amounts. “I pleaded, urged, and almost threatened. As each one promised, I put his name and the amount down in my little book, and continued to solicit from every possible subscriber.”<sup>68</sup> Perhaps nothing in his early life so foreshadowed his unswerving pursuit of business goals. “The plan absorbed me,” he admitted. “I contributed what I could, and my first ambition to earn money was aroused by this and similar undertakings in which I was constantly engaged.”<sup>69</sup> In a matter of months, he had raised \$2,000 and saved the church. By age twenty, he had emerged as the second most important member of the congregation, surpassed only by the preacher.

With a mostly spartan country education and scant exposure to big-city culture, John D. Rockefeller’s mind was largely furnished with precepts and phrases from his Baptist fundamentalist church. Throughout his life, he extracted from Christianity practical lessons for living and emphasized the utility of religion as a guide in mundane affairs. Over time, the American public would wonder how he squared his predatory bent with his religion, yet much that was preached in the church of his youth—at least as Rockefeller saw it—encouraged his moneymaking predilections. Far from placing obstacles in his path, the religion he encountered seemed to applaud him in his course, and he very much embodied the sometimes uneasy symbiosis between church and business that defined the emerging ethos of the post-Civil War American economy.

Rockefeller never wavered in his belief that his career was divinely favored and asserted bluntly, “God gave me my money.”<sup>70</sup> During the decades that he taught Sunday-school classes, he found plenty of scriptural evidence to buttress this claim. (Of course, his critics would cite many contrary quotations, warning of the pernicious influence of wealth.) When Benjamin Franklin was a boy, his father had pounded into his head the proverb “Seest thou a man diligent in his business? He shall stand before kings,” and Rockefeller often presented this text to his class. Martin Luther had exhorted his congregation, “Even though [your work] seems very trivial and contemptible, make sure you regard it as great and precious, not on account of your worthiness, but because it has its place within that jewel and holy treasure, the Word and Commandment of God.”<sup>71</sup> Many eminent nineteenth-century theologians took the Calvinist view that wealth was a sign of God’s grace and poverty a telltale sign of heavenly disfavor. Henry Ward Beecher, calling poverty the fault of the poor, proclaimed in a sermon that “generally the proposition is true, that where you find the most religion you find the most worldly prosperity.”<sup>72</sup>

As to why God had singled out John D. Rockefeller for such spectacular bounty, Rockefeller always adverted to his own adherence to the doctrine of stewardship—the notion of the wealthy man as a mere instrument of God, a temporary trustee of his money, who devoted it to good causes. “It has seemed as if I was favored and got increase because the Lord knew that I was going to turn around and give it back.”<sup>73</sup> Rockefeller said this in his late seventies, and one wonders whether the equation between moneymaking and money giving only entered his mind later. Yet even as a teenager, he took

palpable pleasure in distributing money for charitable purposes, and he insisted that from an early date he discerned the intimate spiritual link between earning and dispensing money. “I remember clearly when the financial plan—if I may call it so—of my life was formed. It was out in Ohio, under the ministration of a dear old minister, who preached, ‘Get money; get it honestly and then give it wisely.’ I wrote that down in a little book.”<sup>74</sup> This echoed John Wesley’s dictum, “If those who ‘gain all they can’ and ‘save all they can,’ will likewise ‘give all they can,’ then the more they will grow in grace.”<sup>75</sup> Rockefeller operated by such spiritual double-entry bookkeeping, with his charity serving, in time, as incontestable proof of his fortune’s purity. It might well be that his early commitment to charity gave him some inner license needed to pursue wealth with unparalleled—and at times unprincipled—vigor.

As Max Weber observed, ascetic Christianity was a matchless breeding ground for would-be businessmen. The practice of tithing, for instance, instilled habits of thrift, self-denial, and careful budgeting that were invaluable assets for any aspiring capitalist. John D. Rockefeller was the Protestant work ethic in its purest form, leading a life so consistent with Weber’s classic essay that it reads like his spiritual biography. It might be useful to note some of Weber’s aperçus that apply with especial force to Rockefeller. Weber argued that the Puritans had produced a religion that validated worldly activity, with “the making of money by acquisition as the ultimate purpose” of life.<sup>76</sup> They approached business in a rational, methodical manner, banishing magic from the marketplace and reducing everything to method. Because prosperity was a sign of future salvation, the elect worked with special diligence to reassure themselves of God’s favor. Even those who amassed great wealth continued to labor, since they worked, ostensibly, for God’s glory, not for their own aggrandizement. The church didn’t want to be in the position of promoting greed, so it circumvented this problem by legitimating the pursuit of money if channeled into a calling—that is, the steady dedication to a productive task. Once a person discovered his calling, he was supposed to apply himself with all-consuming devotion, the money thus acquired being deemed a sign of God’s blessing.

One by-product of the emphasis on a calling was that Puritans relegated activities outside the religious and economic sphere to a lesser order of importance. The believer wasn’t supposed to search for pleasure beyond the sheltered confines of family, church, and business, and the gravest sins were wasting time, indulging in idle chatter, and wallowing in luxurious diversions. Bent on making money, the good Puritan had to restrain his impulses instead of gratifying them. As Weber remarked, “Unlimited greed for gain is not in the least identical with capitalism, and is still less in spirit. Capitalism *may* even be identical with the restraint, or at least a rational tempering, of this irrational impulse.”<sup>77</sup> That is, the man who would be rich must be thrifty. People had to regulate their lives, Weber argued, so that self-abnegation could bring forth plenty. A fateful contradiction lay at the heart of this Puritan culture, for the virtues of godly people made them rich, and these riches, in turn, threatened to undermine that godliness. As Cotton Mather declared of the Plymouth colony in the 1690s, “Religion begot prosperity, and the daughters devoured the mother.”<sup>78</sup> This contradiction posed a central dilemma for John D. Rockefeller and his descendants, who would struggle tirelessly against the baneful effects of wealth.

Of the four principal groups of ascetic Protestants analyzed by Weber, we should note, the Baptists alone rejected predestination and therefore couldn’t construe wealth as an infallible sign of God’s favor. On the other hand, as Weber pointed out, certain Baptist tenets prepared its adherents to prosper in the marketplace. Abhorring religious idolatry, demoting sacraments as a means to salvation, Baptism fostered a rational outlook that was well suited to advancement in capitalist society. Rockefeller was convinced that he had a God-given talent for making money, was obligated to develop it, and was liberally rewarded by God—all compatible with Baptist doctrine. For this reason, he found religion far more of a spur than a hindrance to his ambitions. Where others saw him as an anomaly in a denomination that always welcomed working people and harbored a faint distrust of the rich, he never saw any such contradiction.

Before leaving Rockefeller’s early Baptist indoctrination, we should note that the economic climate of his adolescence must have deepened his religious convictions. In 1857, while he was still at Hewitt and Tuttle, America fell into an economic slump. The proximate cause was the end of the Crimean War in 1856, which dealt a blow to American farmers who had profited from the war. On a more profound level, the crisis capped a decade of frantic speculation in railroad securities and land, stoked by heavy borrowing. As five thousand businesses failed and hundreds of thousands of workers were idled, the exuberant boosterism of the 1850s was suddenly and dramatically quelled.

As happened in the Great Depression of the 1930s, people were shocked that an effervescent economy could stall so woefully. As one contemporary observer put it, “It seems indeed strange that in the very midst of apparent health and strength . . . the whole country . . . should suddenly come to a dead stop and be unable to move forward—and that we should suddenly wake up from our dreams of wealth and happiness, and find ourselves poor and bankrupt.”<sup>79</sup> A wave of hysterical breast-beating ensued, with President James Buchanan insisting that the crisis came “solely from our extravagant and vicious system of paper currency and bank credits, exciting the people to wild speculations and gambling in stocks.”<sup>80</sup>

Rather than blaming the business cycle, many evangelical Christians interpreted the downturn as divine punishment for a society grown lax, worldly, and dissolute. One Boston reformer descried redeeming features in the slump, hoping it would “teach good and much needed lessons . . . and will reduce all things here to a more sober, sound, and healthy condition.”<sup>81</sup> The mood of national self-flagellation prompted a religious upsurge known as the Businessmen’s Revival. In 1857, businessmen gathered in many cities for lunchtime prayer meetings where they publicly swore off drink and other indulgences. During this massive outpouring of repentance, evangelical churches recruited tens of thousands of new members. The shift from euphoria to depression in the business sphere—mirrored by a shift from sin to salvation in the religious sphere—probably strengthened Rockefeller’s innate conservatism as a fledgling businessman while bolstering his already deep-seated Baptist inclinations. As he said, “What a school—the school of adversity and stress—to train a boy in!”<sup>82</sup>

Whatever the general misery caused by the 1857 panic, William Avery Rockefeller’s medical road show thrived that year, and he briefly managed to support and juggle two marriages. In the spring of 1856, Bill had surfaced again in Cleveland, rooming with John and William at Mrs. Woodin’s while scouting out a permanent home for his family. He was residing intermittently with Margaret Allen’s family in Ontario, posing as Dr. William Livingston, and now had to make some final disposition before he deserted his first wife and children for good. When he found a roomy brick house for rent at 35 Cedar Street, equipped with such luxuries as indoor toilet and bathroom, he brought Eliza and the children in from Parma. John and William moved out of Mrs. Woodin’s place and were reunited with their family. At this point, Bill decided that John should contribute to the family upkeep and pay him the same rent he had given to Mrs. Woodin.

In 1857, Bill decided to build for his family a substantial brick house on Cheshire Street in downtown Cleveland, a farewell gift that would enable him to abscond with a clear conscience. “In 1857 my father told me to build a house,” said John D., giving the story a positive gloss. “It was a lesson in self-reliance. He handed me the money, told me the sort of house he wanted and left all the details of the business to me. I drew plans, got the material, found a builder, and built the house.”<sup>83</sup> Did Bill regard this as some final test, a crash course in business for John, before he abandoned his family to the tender mercies of chance? As he warned his son, “I shall be away and must rely on your judgment.”<sup>84</sup> Or perhaps Bill just wanted to be spared the inconvenience of doing it himself.

Rockefeller was justifiably proud of his feat of superintending this house, a bravura performance for a boy of eighteen with an already demanding schedule at Hewitt and Tuttle. As if he had been doing nothing but construction work all his life, he solicited estimates from eight contractors and selected the lowest bidder. He reviewed the plans, negotiated the contracts, and settled the bills with implicit confidence in his judgment. In fact, so closely did he supervise the contractors, so zealously did he outbargain them, that they lost money on the project. If Bill was testing his son’s ability, he passed with flying colors.

By one account, a dispute arose as to whether John would pay rent at the new house. He presumably felt that, having built the structure, he had earned the right to occupy it free of rent, but Devil Bill laid down his own arbitrary rules and overrode Eliza’s protests. “You bought your time, didn’t you?” he told John. “What you’re getting now is your own, ain’t it? Well, you have to pay me board.”<sup>85</sup> Once again, one marvels at Bill’s barefaced cheek no less than his son’s fortitude in the face of repeated provocations.

Now that the Rockefellers were reconstituted in Cleveland, John was deputized as the new paterfamilias, as Bill again exited from the scene, setting up house in Philadelphia with Margaret Allen sometime in the late 1850s. For several more years, Bill was weirdly enmeshed in John’s affairs and for five decades continued to materialize, like a burly, smiling genie, at odd intervals. But from this point forward, the gap between Bill’s two lives and two wives began to widen into an unbridgeable chasm. By an exquisite (and, for Bill, surely excruciating) irony, this scheming, selfish, money-mad charlatan turned his back on his family just as his eldest son began to amass the largest fortune in history. John D. Rockefeller inhabited a stoic universe in which it was considered a sign of strength and mental health to banish your cares and forge ahead instead of morbidly dwelling on your parents’ failings. But if John nursed vengeful feelings toward Bill, it must have been secretly gratifying to him that his father left at the very dawn of his triumph and forfeited any claim to his wealth.

Eliza probably never knew that after she’d raised his five children, Bill had traded her in for a much younger woman, but she was now better equipped to withstand his loss than she had been a few years earlier. When John Davison died on June 1, 1858, he left her an annuity that lasted through 1865, when she inherited the principal. With two sons drawing income—William was now working under John as a bookkeeper at Hewitt and Tuttle—and with occasional assistance from Bill, Eliza could muddle through on her own. She especially relied upon her eldest son, the wunderkind who seemed capable of anything and who was as steady and trustworthy as her husband had been feckless and mercurial. Eliza was now in her mid-forties, and photos show a prim, sad, gaunt woman. Divorce wasn’t an option for a devout nineteenth-century woman, and her giddy fling with the handsome young peddler had left her imprisoned in a premature widowhood. Bill had been her sole chance, her crazily squandered bid to escape from rural tedium, and the misbegotten marriage left both her and her eldest son with a lifelong suspicion of volatile people and rash actions.

In his trilogy of Frank Cowperwood novels, his fictionalized version of the life of the Chicago traction magnate Charles Yerkes, Theodore Dreiser described the uncanny perspicacity about his bosses that distinguished the adolescent Cowperwood in his first job as a clerk in a grain-commission business. “He could see their weaknesses and their shortcomings as a much older man might have viewed a boy’s.”<sup>86</sup> The remark aptly captures the coolly critical eye with which Rockefeller sized up his elders at Hewitt and Tuttle. He was respectful toward his superiors but never awed by them and was always aware of their shortcomings. For the record, he professed great respect for Isaac Hewitt, twenty-five years his senior, but he was much more caustic in private, referring to him as a “disgruntled” man, forever entangled in litigation.

Despite his youth, Rockefeller soon came to feel that he was being underpaid. When Tuttle quit in January 1857, Rockefeller was elevated to chief bookkeeper, performing, at the age of seventeen, all the tasks formerly discharged by the departed partner. Where Tuttle had earned \$2,000 a year as partner, Rockefeller was given only \$500, and this vexing inequity was only slightly mitigated when Hewitt raised him to \$600 a year by 1858. With the same preternatural confidence evident in his campaign to pay off the church mortgage or oversee the Cheshire Street house, the boy began to trade for his own account, making small but successful forays into flour, ham, and pork. Soon, this adolescent businessman was cutting something of a figure on the Cleveland docks, where he was always addressed as Mr. Rockefeller.

A variety of factors conspired to bring about his departure from Hewitt’s firm. Though his salary grated on him, he waited until the economy snapped back from the 1857 downturn before making his move. In charge of the books, he could see that the firm had nearly been bankrupted by the slump and faced a bleak future—a suspicion confirmed by the fact that Hewitt shrewdly kept his extensive real-estate holdings segregated from his stake in the commission house. Big Bill, who always liked to play the freelance banker, had given a thousand-dollar loan to Hewitt, and when John informed him of the concern’s precarious state, he barged into the office and demanded (and got) immediate repayment from Hewitt.

John D. Rockefeller wasn’t one to dawdle in an unprofitable concern. His career had few wasted steps, and he never vacillated when the moment ripened for advancement. When he asked Hewitt for an \$800 salary, his cash-strapped boss dithered for weeks before deciding he could go no higher than \$700. Later, Rockefeller claimed he would have stayed if Hewitt had matched his demand, but added, “even then I was preparing, getting ready for something big.”<sup>87</sup> While he and Hewitt were bickering in early 1858, an attractive opportunity arose that settled the issue. Rockefeller had befriended a young Englishman, twenty-eight-year-old Maurice B. Clark, who worked down the street at a produce house called Otis, Brownell. They had been classmates at E. G. Folsom’s Commercial College and were also neighbors on Cheshire Street. According to Clark, Rockefeller already had “the reputation of being a young bookkeeper of more than ordinary ability and reliability,” and Clark proposed that they form a new partnership for buying and selling produce, with each partner investing an initial \$2,000—an amount equal to \$36,000 in 1996 dollars.<sup>88</sup> Amazingly enough, Rockefeller had saved \$800, equivalent to a year’s salary, in less than three years on the job, but he still fell considerably short of Clark’s figure.

As he brooded over how to raise the money, he was informed by his father that he had always intended to give each of his children \$1,000 at age twenty-one, and he now offered to advance John the money. “But, John,” he added, lest his son expect miracles, “the rate is ten.”<sup>89</sup> Having just retrieved a thousand dollars from Hewitt, Bill might have been looking for a high return on these idle funds. John knew his father far too well to plead for a gift and accepted the 10 percent loan, which was higher than the prevailing rate. So on April 1, 1858, backed up by this borrowed money, John D. Rockefeller left Isaac Hewitt and joined the new partnership of Clark and Rockefeller at 32 River Street. At eighteen, he was catapulted to a partner’s rank in a commission house. “It was a great thing to be my own employer,” said Rockefeller. “Mentally I swelled with pride—a partner in a firm with \$4,000 capital!”<sup>90</sup> The moment was fraught with meaning for him, and after his first day at work he went back to the Cheshire Street house, fell to his knees, and implored the Lord to bless his new enterprise.

Rockefeller never regretted his apprenticeship at Hewitt and Tuttle and, like many self-made men, lavished a retrospective tenderness on his early years. If anything, he drenched the whole experience in a sentimental syrup that only grew thicker and sweeter with time. Even in 1934, at age ninety-five, Rockefeller tried to rally one grandson with tales of his heroic initiation at Hewitt and Tuttle, his stirring baptism in business. “Oh how blessed the young men are who have to struggle for a foundation and a beginning in life. I shall never cease to be grateful for the three and a half years of apprenticeship and the difficulties to be overcome, all the way along.”

*Baptism in Business*

When the sign reading “Clark and Rockefeller” was hoisted atop the warehouse at 32 River Street, the local business community warmly greeted the new arrivals. The Cleveland Leader wrote, “As experienced, responsible and prompt businessmen, we recommend their house to the favorable consideration of our readers.”<sup>1</sup> In this first partnership, success seemed to come quickly and easily to Rockefeller. With a booming traffic in meat, grain, and other foodstuffs circulating through the Great Lakes, he and Clark nimbly bought and sold carloads of produce. As the firm’s ambitious circular stated, they were prepared to deal in “grain, fish, water, lime, plaster, coarse fine solar and dairy salt.”<sup>2</sup> The fledgling firm weathered just enough perils to lend, retrospectively, nostalgic charm to this maiden period. Two months after opening for business, the partners had to cope with a severe frost that damaged midwestern crops. Having contracted to buy a large shipment of beans, they wound up with a big, semispoiled batch, strewn with dirt and rubbish. “When we were not needed in the office we used to go out to the warehouse, my partner and I, and sort out those beans.”<sup>3</sup> This setback didn’t detract from the firm’s overall performance, for by year’s end it had netted a highly respectable \$4,400, tripling the income that John had made during his last year at Hewitt and Tuttle.

But because of the bean fiasco, John had to turn again, however grudgingly, to Big Bill for a rescue loan. To excel in commodities, it was imperative to offer generous financing, and Clark and Rockefeller advertisements trumpeted to prospective clients that they were “prepared to make liberal advances and consignments of produce, etc.”<sup>4</sup> With his son, Bill often liked to play sadistic money games and then defended his knavish behavior by citing some warped, pedagogical purpose. As he bragged to a Strongsville neighbor, “I trade with the boys and skin ’em and I just beat ’em every time I can. I want to make ’em sharp.”<sup>5</sup> John was by now resigned to the bizarrely commercial character of his dealings with his father, and in his memoirs he even idealized Bill’s lending maneuvers as teaching him valuable lessons. “To my father I owe a great debt in that he himself trained me to practical ways. He was engaged in different enterprises; he used to tell me about these things, explaining their significance; and he taught me the principles and methods of business.”<sup>6</sup>

As John knew, his father’s style as a banker followed a grimly manic pattern of conviviality giving way to Scrooge-like severity. “Our relations on finances were a source of some anxiety to me, and were not quite so humorous as they seem now as I look back on them,” Rockefeller allowed, permitting a smidgen of anger to show.<sup>7</sup> When Bill offered a 10 percent loan, the real motive was something other than altruism, for he had an infuriating habit of calling in loans at the least opportune time. “Just at the moment when I required the money most he was apt to say, ‘My son, I find I have got to have that money,’ ” John D. recalled in his memoirs. “ ‘Of course, you shall have it at once,’ I would answer, but I knew that he was testing me, and that when I paid him, he would hold the money without its earning anything for a little time and then offer it back later.”<sup>8</sup> About this continuing psychodrama, Rockefeller later said, in another fleeting moment of candor, “he would never know how angry I felt beneath the surface.”<sup>9</sup>

An intimate, critical perspective on the perverse relations between Rockefeller and his father comes from George W. Gardner, who joined Clark and Rockefeller as a partner on April 1, 1859. Having worked with Clark at Otis, Brownell, he was evidently invited into the firm to shore up its capital. Scion of an elite Cleveland family, cut from a different cloth than the self-made men of Rockefeller’s early years, Gardner later served as mayor of Cleveland and commodore of the Cleveland Yacht Club. With Gardner’s arrival, Rockefeller’s name was dropped from the firm’s title, and the new partnership was styled Clark, Gardner and Company, the ostensible and quite cogent reason being that Gardner’s name would entice more clients. Rockefeller always felt uneasy about venting anger or making an egotistical show of protest, and he pretended to accept this demotion with equanimity. “Maurice Clark was very pleasant about it,” he later insisted. “And he said, ‘Never mind. It won’t be very long—before many years you’ll be doing better than any of us.’ Yes, he was very nice about it. I made no objection.”<sup>10</sup> Yet this stinging blow rankled, as he later admitted. “I considered this a great injustice to me as I was an equal partner and Gardner brought in only his share of the capital, but I thought it best to submit.”<sup>11</sup> It says much about Rockefeller that he thought it unseemly and unchristian to confess to such understandable feelings of injured pride.

Rockefeller was bound to clash with Gardner and Clark, for he was a Roundhead among Cavaliers and approached his work with unflagging, humorless energy. “Your future hangs on every day that passes,” he admonished himself.<sup>12</sup> “Long before I was twenty-one men called me, ‘Mr Rockefeller,’ ” he recalled. “Life was a serious business to me when I was young.”<sup>13</sup> The only time he showed any youthful gaiety was when sealing a lucrative deal. Like the resident moral overseer, he felt contempt for Clark and Gardner’s easygoing ways and irreverent spirit, and they found this young killjoy both a welcome and grating presence in the office.

Afraid that any levity would diminish their chances of getting loans, the twenty-year-old sought to stifle the excesses of his older partners. When Gardner and three friends purchased a \$2,000 yacht, Rockefeller roundly condemned this extravagance. One Saturday afternoon, Gardner was about to escape from the office for an afternoon sail when he saw Rockefeller hunched glumly over his ledgers. “John,” he said agreeably, “a little crowd of us are going to take a sail over to Put-in-Bay and I’d like to have you go along. I think it would do you good to get away from the office and get your mind off business for a while.” Gardner had touched an exposed nerve and, as he recounted years later to a reporter, his young partner wheeled on him savagely. “George Gardner,” he sputtered, “you’re the most extravagant young man I ever knew! The idea of a young man like you, just getting a start in life, owning an interest in a yacht! You’re injuring your credit at the banks—your credit and mine. . . . No, I won’t go on your yacht. I don’t even want to see it!” With that, Rockefeller leaned back over his account books. “John,” said Gardner, “I see that there are certain things on which you and I probably will never agree. I think you like money better than anything else in the whole world, and I do not. I like to have a little fun along with business as I go through life.”<sup>14</sup>

Later on, Rockefeller learned to camouflage his business anxiety behind a studied calm, but during these years it was often graphically displayed. Clark remembered one daring venture when the firm wagered its entire capital on a large grain shipment to Buffalo. With foolish, atypical imprudence, Rockefeller suggested that they skip the insurance and pocket the \$150 premium; Gardner and Clark reluctantly acquiesced. That night, a terrible storm blew across Lake Erie, and when Gardner came to the office the next morning, a frightfully pale Rockefeller paced the floor in agitation. “Let’s take out

insurance right away,” he said. “We still have time—if the boat hasn’t been wrecked by now.” Gardner ran off to pay the premium. By the time he got back, Rockefeller was waving a telegram announcing the ship’s safe arrival in Buffalo. Whether unnerved by the episode or upset at having paid the unnecessary premium, Rockefeller went home ill that afternoon.<sup>15</sup>

One suspects that Rockefeller associated the bon vivant Gardner with his father, much to Gardner’s detriment. Indeed, Gardner felt an affinity with Bill, relishing his bonhomie and outlandish humor and calling him “one of the most companionable and most likeable old men I ever knew. He would crack jokes and have more to say in one conversation than John would utter in a week.”<sup>16</sup> Gardner was the first of many Rockefeller associates to note the unanswered questions about Bill, who returned to Cleveland at irregular intervals, invariably depositing or withdrawing huge amounts of cash from Clark, Gardner. “I wondered what business a man could be in that he would have \$1,000 to spare one month and need it the next,” said Gardner.<sup>17</sup>

Thanks to Gardner, we can date the earliest moment at which we can say with some certainty that John knew of his father’s scandalous relationship, if not of his bigamy. The firm was starting to cultivate business contacts in Philadelphia, and it occurred to Gardner that on his next trip there, he might solicit information from Bill. “So I asked John for his father’s address. He hesitated and finally said he couldn’t remember.” This immediately puzzled Gardner, who knew Rockefeller had a phenomenal memory, and he asked if he could secure the address from Eliza at lunchtime. After lunch, John never alluded to the matter, and as they prepared to leave that evening, Gardner again inquired after the address. “He flushed up and said he’d forgotten to ask for it when he went home. I pressed him no further, and never found out where his father lived.”<sup>18</sup> When John began to fathom the depth of his father’s duplicity toward his mother, he must have inwardly reeled, and he reacted with the same repressed emotion and steadfast evasion that had served him as a boy. Already Rockefeller was treating his father as the supreme taboo subject, setting a pattern for the unremitting secrecy that would pervade Standard Oil.

Photos of Rockefeller from the Clark, Gardner period show a tall young man with a vigorous air and alert, penetrating eyes. His tightly compressed lips expressed a fierce determination and a guarded nature. Big and broad-shouldered, he had an incipient stoop that gave him a wary air. Despite his occasional, priggish blowups with Gardner, he had that sublime self-confidence that speaks with quiet authority. Neatly dressed and well groomed, Rockefeller was the first to arrive at and the last to leave work each day. In a natural division of labor, Clark took charge of buying and selling while Rockefeller tended the books. Rockefeller seemed destined to succeed as much from his fastidious work habits as from innate intelligence. With the avidity of a zealous auditor, he liked to smoke out wrongdoing and uncover errors. Maurice Clark thought John congenial but “too exact. He was methodical to an extreme, careful as to details and exacting to a fraction. If there was a cent due us, he wanted it. If there was a cent due a customer, he wanted the customer to have it.”<sup>19</sup> The portrait, if slightly chilling, also underscores Rockefeller’s prudish honesty during this phase of his career.

From the outset, Rockefeller had to wrestle with the demons of pride and greed. When rebuffed by a bank officer for a loan, he shot back in anger, “Some day I’ll be the richest man in the world.”<sup>20</sup> He went through the week cautioning himself with proverbs taught by Eliza, such as “Pride goeth before a fall,” and this spiritual self-scrutiny intensified with his growing wealth.<sup>21</sup> When he rested his head on the pillow at night, he warned himself, “Because you have got a start, you think you are quite a merchant; look out, or you will lose your head—go steady. Are you going to let this money puff you up? Keep your eyes open. Don’t lose your balance.”<sup>22</sup> Had Rockefeller not feared his own capacity for excess, he wouldn’t have engaged in such strenuous introspection. As he said, “These intimate conversations with myself, I’m sure, had a great influence on my life. I was afraid I could not stand my prosperity, and tried to teach myself not to get puffed up with any foolish notions.”<sup>23</sup> It’s easy to suppose that Rockefeller’s typically sententious style was borrowed from church and first polished by these nightly sermons that he preached to himself.

That Rockefeller led an unblemished Christian life played no small role in his business accomplishments, for he appealed to the older citizens in town. During his first year with Clark, he hired someone to look after the books while he took to the open road to drum up business, traveling widely in Ohio and Indiana. Contrary to what one might expect, Rockefeller was a smoothly persuasive salesman. Instead of brashly trying to poach clients from rivals, he modestly outlined his firm’s services. “I would go into an office and present my card and say to the man that I supposed his business connections were satisfactory, and that I did not wish to intrude upon him, but that I had a proposition that I myself believed in and believed it would be to his advantage, that I did not expect him to decide off hand but asked him to think it over and I would see him again about it.”<sup>24</sup> Orders to handle commodity trades poured in almost faster than he could handle them. “I found that old men had confidence in me right away, and after I stayed a few weeks in the country, I returned home and the consignments came in and our business was increased and it opened up a new world for me.”<sup>25</sup>

Rockefeller handled people adroitly and wasn’t the cold curmudgeon of later myth. However, he *was* persistent, which pleased or displeased people according to taste. Previewing a problem that bedeviled the oil business, the commodity business was chronically short of railroad cars to transport flour, grain, and pork, and Rockefeller badgered one railroad official so much that the older man finally wagged a finger at him and snapped, “Young man, I want you to understand you can’t make a shuttlecock of me.”<sup>26</sup> Rockefeller often related how the firm’s best customer once pressed him to violate conservative business practice and advance him money before the produce or bill of lading was in hand. Though Rockefeller refused him, he still tried to keep the customer. “But he stormed about, and in the end I had the further humiliation of confessing to my partner that I had failed.”<sup>27</sup> Only afterward did Rockefeller learn that the customer’s intransigence was a cunning trap set by a local banker to see whether these young men could withstand temptation and hew to their conservative principles.

For all his populist mistrust of bankers, Rockefeller owed much of his incandescent rise to their assistance. “The hardest problem all through my business career was to obtain enough capital to do all the business I wanted to do and could do, given the necessary amount of money.”<sup>28</sup> The banking system was then weak and atomized. Many Main Street banks were thinly capitalized, and they inspired so little trust that Rockefeller’s firm kept spare cash in the safe. Rockefeller got his first extrafamilial loan from a kindly, benevolent old banker named Truman P. Handy, who agreed to take warehouse receipts as collateral. After getting this \$2,000 loan, John almost floated down the sidewalk. “Just think of it,” he mused, “a bank had trusted me for \$2,000! I felt that I was now a man of importance in the community.”<sup>29</sup> Handy made Rockefeller swear that he would never speculate with the \$2,000, and the young man must have sensed that he had won the first of many influential mentors in Cleveland’s financial community. Besides being a bank president, the gravely proper Handy was a Sunday-school superintendent and had sounded out Isaac Hewitt on the young man’s character and habits. As Rockefeller realized, his credit rating depended upon reports of his sterling character—just as he had lectured George Gardner—and his status as a

mainstay of the Erie Street Baptist Mission Church guaranteed him a friendly reception at banks. Thus, Rockefeller's initial loan shows the close mesh of Christianity and capitalism in his early career.

Famously averse to borrowing in later years, Rockefeller was extraordinarily adept at it when he needed the capital. As Clark said, "Oh, John was the greatest borrower you ever saw!"<sup>30</sup> In bargaining with banks, Rockefeller gave evidence of his father's wiliness and mastery of crowd psychology. If he wanted to borrow \$5,000, he let it be bruited about town that he wished to invest \$10,000. This rumor would certify his firm's rock-solid credit while also giving bankers an added incentive to extend him a loan. Rockefeller's need for money only grew during the Civil War, which was a bonanza for the commodity business. As a partner in a Cleveland produce house, John D. Rockefeller was strategically positioned to profit from the war, and for the rest of the century his career seemed to march in perfect lockstep with the progress of American business history.

For Rockefeller, the Civil War was principally an opportunity to pile up riches, yet he betrayed intense sympathy for the Union cause and fervently advocated abolishing slavery. As early as his 1854 high-school essay on freedom, he had railed against "cruel masters" who worked their slaves "beneath the scorching suns of the South. How under such circumstances can America call herself free?"<sup>31</sup> As a teenager, he had contributed to several charities that aided blacks. At the time, his antislavery views were representative of the prevailing views in Cleveland, which had many relocated New Englanders and was a hotbed of abolitionist sentiment. With its favorable political climate and position as a big Lake Erie port, Cleveland was a stop on the Underground Railroad that transported fugitive slaves to freedom in Canada, and many of them surreptitiously boarded ships just blocks from Rockefeller's office. When slave hunters invaded the town, abolitionist sympathizers rushed to the Stone Church on the Public Square and tolled the bell to alert the populace. In 1860, Rockefeller cast his first presidential vote for Abraham Lincoln, and on the eve of the war he attended meetings that resounded with thunderous denunciations of slavery. Abolitionist fervor was especially widespread among evangelical Christians who deplored slavery and Catholicism as twin tyrannies, and northern Baptist congregations warmly received black preachers and lecturers who spoke for the abolitionist cause.

So why didn't Rockefeller act on his keenly felt sympathies when Lincoln appealed for 75,000 volunteers after Fort Sumter's fall in April 1861? Why did he turn a deaf ear to the torchlight rallies and street-corner recruiters swarming through Cleveland that spring? "I wanted to go in the army and do my part," Rockefeller said. "But it was simply out of the question. We were in a new business, and if I had not stayed it must have stopped—and with so many dependent on it."<sup>32</sup> This last sentence hinted gingerly at what must have been the main reason behind his failure to serve: his father's desertion of the family and his own need to sustain it. Though the Union government offered no occupational exemptions from the draft, men were excused if they were the sole means of support for siblings, children, or parents. Though only twenty-one at the outbreak of the war, John D. was effectively in the position of a middle-aged father responsible for a family of six.

Like J. P. Morgan, Grover Cleveland, Theodore Roosevelt, Sr., and other well-heeled young men, Rockefeller hired a substitute for \$300 and ended up outfitting a small army. One morning, Levi Scofield, a captain in the Union army and a friend of Rockefeller's, marched thirty raw recruits into his River Street office. They evidently passed muster, for Rockefeller dug into his safe and handed a ten-dollar bill to each of them. "God, but he must be rich," gasped one young man, causing another to reply, "Yes, they say he is a rich man—that he is worth as much as \$ 10,000!"<sup>33</sup> For the first time, Rockefeller had triggered fantasies of riches. Allan Nevins has suggested that Rockefeller exaggerated when he claimed to have financed between twenty and thirty soldiers, noting that Rockefeller's ledger itemizes only \$138.09 for war purposes. Yet a historian of Rockefeller's Cleveland years, Grace Goulder, pointed out that by 1864, Rockefeller was giving about \$300 per year to substitutes and their families besides his general donations to wartime charities.

Since Rockefeller's commodity business depended upon market intelligence and a rapid flow of telegrams from various sections of the country, his office became a clubhouse for the latest battlefield bulletins. He and Maurice Clark tacked up two large, detailed maps and tracked the war's progress with rapt attention. "Our office became a great rallying-place," said Rockefeller. "We were all deeply interested. Men used to drop in often, and we followed the war keenly, reading the latest dispatches and studying the maps."

While Rockefeller's brother William also managed to duck service and keep on working, the youngest brother, Frank, was both physically and psychologically wounded during the war. Not yet sixteen when the war started, Frank was hot-blooded and temperamental. With a wide face, broad forehead, and handlebar mustache, he was very much in his father's mold. Where John had a tidy, inner-directed nature, Frank was quick to yield to impulses both base and noble. A much better mixer than John, an outgoing backslapper, he could be kindhearted and generous toward friends.

Frank had an adolescent yearning for battlefield glory but was initially thwarted in this storybook aspiration by his family. George Gardner, who always took a jaundiced view of John, claimed that John had coldly declined his brother's request for \$75 to enlist in the Union army. In Gardner's telling, John gave his brother a tongue-lashing: "You would be a wild, foolish boy to go away and waste youthful years that you might utilize in getting a start and making money."<sup>34</sup> When John remained adamant, Gardner advanced Frank the \$75—the first of innumerable loans that Frank, professing good intentions all the while, incurred but never repaid. This altercation was the first of many rancorous feuds that poisoned relations between John and Frank through the years.

While Gardner might have accurately reported John's words, he omitted some important mitigating circumstances. Frank had already tried to slip off and furtively enlist and had been reprimanded by his father for his secrecy. "Young man," said Bill, "when you go to war you will say goodbye to the family and go out the front door in broad daylight."<sup>35</sup> (It took a certain gall for Bill to get on his high horse on the subject of secrecy and family responsibility.) Another factor probably swaying John was that Frank had already been rejected as underage and would need to resort to deception to join the army. To aid his memory, Frank now chalked the number eighteen on his soles, and when the recruiting station sergeant asked for his age, he piped up, "I'm over eighteen, sir."<sup>36</sup> In the end, John relented and paid for his brother's clothing, rifle, and accessories during his three years of military service.

As a private in the Seventh Ohio Volunteer Infantry, Frank was wounded twice during the war, at Chancellorsville and Cedar Mountain, which didn't help his already strained relations with John. It must have seemed terribly unjust to Frank that while he waded through bloody battlefields, his eldest

brother was raking in the money at home. He always felt that he had paid a severe price for heroism while John was rewarded for his self-aggrandizement. Ineffectual and full of self-pity, feeling cursed by bad luck, Frank envied his remarkable older brother, who seemed to succeed at every assignment and moved through his charmed business life with icily inexorable efficiency.

The Civil War accelerated the North's economic development, setting the stage for its postwar industrial prowess. It greatly enlarged its industrial capacity, broadening the infrastructure of railroads and telegraphs, coal mines and iron mills as the economy became more mechanized to meet the unprecedented demand for materials. Sewing machines stitched uniforms for soldiers while reapers harvested grain to feed them. As both sides swiftly conveyed huge armies from one theater of battle to the next, the railroad network had to be modernized and expanded accordingly. To encourage further development, the federal government began to provide land grants, with a dozen railroads ultimately taking title to a staggering 158 million acres. This pell-mell growth played a pivotal role in Rockefeller's career, for the proliferation of railroads enabled him to extract discounts from them by playing one off against the other.

The war's psychological impact was equally consequential as it afforded opportunities for commercial gain on a scale never seen before. The outsize profits garnered from government contracts contributed to a money delirium that long outlasted the war. The Civil War not only generated new fortunes but bred in countless people an insatiable appetite for riches. As farm boys in uniform were exposed to cities and given titillating glimpses of luxury goods and urban sophistication, consumerism received a huge impetus. Even many men who didn't enter the army abandoned farms and villages during the war and flocked to populated areas with flourishing munition plants.

The war enhanced Cleveland's strategic importance for a simple logistical reason: As North-South fighting severed freight routes on the Mississippi River, the east-west routes through the rivers and Great Lakes gained a corresponding amount of traffic. Though Rockefeller and his associates secured no lucrative government contracts, they profited from the enormous inflation in commodity prices and the general business surge. Selling mostly on commission, they dealt in numerous foodstuffs and farm implements. By 1862, their annual profits had soared to \$17,000, or almost four times what they had earned during their only prewar year. One of their 1863 advertisements listed the bountiful produce now heaped in their bulging warehouse: 1,300 barrels of salt, 500 bushels of clover seed, 800 bushels of timothy seed, and 200 barrels of pork.

At the end of 1862, Rockefeller eliminated a major irritant when he banished George Gardner from the firm. He later obliterated all traces of Gardner from the oral and written accounts of his life, burying him forever with silence. On December 1, 1862, the *Cleveland Herald* ran the following item: "M. B. Clark and John D. Rockefeller, late of Clark, Gardner and Company, will continue the produce business under style and firm of Clark and Rockefeller, at warehouse recently occupied by Clark, Gardner and Company, Nos. 39, 41, 43, and 45 River Street." That the firm had now swelled to occupy four separate numbers on River Street attests to its runaway success. While he was still in his twenties, the Civil War had converted Rockefeller into a wealthy man, giving him the funds to capitalize on a new industry then flowering in the northwest corner of Pennsylvania. For all the substantial profits booked by Rockefeller during the war, they would prove mere pocket change compared to the profits flowing from the rivers of black gold now gushing from wells around Titusville.

## CHAPTER 5

### The Auction

Long before oil was struck in western Pennsylvania by Colonel Edwin Drake, it had oozed from subterranean springs into Oil Creek (the name dated from the eighteenth century), mantling the surface with an iridescent scum. The slimy liquid was so ubiquitous that it tainted well water and plagued local contractors drilling for salt. Already in the eighteenth century, the Seneca and Cornplanter Indians devised manifold uses for it, employing it for soothing skin liniment, medicine, and even war paint. To extract oil from the creek, they floated blankets or flannel rags on the water, then wrung the oil from the saturated material. Even before Drake's find, Seneca Oil had become known as a sovereign remedy for stiff joints, headaches, and other ailments. Around 1850, Samuel Kier gathered unwanted oil from his father's salt wells, bottled it in little half-pint bottles, and marketed it as Kier's Rock Oil. With a touch of the charlatan, Kier touted the all-purpose medicinal properties of this elixir, contending it would cure liver complaints, bronchitis, and consumption—and that was just for starters. One wonders whether Doc Rockefeller flogged Kier's Rock Oil from the back of his buggy.

In the 1850s, the whale fisheries had failed to keep pace with the mounting need for illuminating oil, forcing up the price of whale oil and making illumination costly for ordinary Americans. Only the affluent could afford to light their parlors every evening. There were many other lighting options—including lard oil, tallow oil, cottonseed oil, coal oil refined from shale, and wicks dipped in fat—but no cheap illuminant that burned in a bright, clean, safe manner. Both urbanization and industrialization sped the search for an illuminant that would extend day into night, breaking the timeless rhythm of rural hours that still governed the lives of farmers and city folk alike.

The petroleum industry was hatched in a very modern symbiosis of business acumen and scientific ingenuity. In the 1850s, George Bissell, a Dartmouth College graduate in his early thirties who had enjoyed a checkered career as a reporter, Greek professor, school principal, and lawyer, had the inspired intuition that the rock oil plentiful in western Pennsylvania was more likely than coal oil to yield a first-rate illuminant. To test this novel proposition, he organized the Pennsylvania Rock-Oil Company, leasing land along Oil Creek, a tributary of the Allegheny River, and sending a specimen of local oil to be analyzed by one of the most renowned chemists of the day, Professor Benjamin Silliman, Jr., of Yale. In his landmark 1855 report, Silliman vindicated Bissell's hunch that this oil could be distilled to produce a fine illuminant, plus a host of other useful products. Now the Pennsylvania Rock-Oil Company faced a single, seemingly insurmountable obstacle: how to find sizable quantities of petroleum to turn Professor Silliman's findings into spendable cash.

It took nearly three years for Bissell's company (which soon evolved into the Seneca Oil Company) to dispatch someone to Pennsylvania to hunt for large, marketable pools of oil. To this end, an investor in the project, a New Haven banker named Townsend, enlisted a boarder in his rooming house, Edwin Drake, to travel to Titusville in December 1857. A former conductor on the New Haven Railroad, Drake was a thirty-eight-year-old widower who was solemn, rather courtly, and disabled by neuralgia of the spine. Photos present a dashing figure with a full beard, broad forehead, and bright, heavy-lidded eyes. Though he made only a nominal investment in the venture, he was dressed up with the fancy title of president to dazzle the gullible yokels and was conveniently endowed (and permanently entered the history books) with the honorific title of colonel.

When Drake arrived in Titusville, Oil Creek Valley was still an idyllic place of dense pine and hemlock forest, rich in game. In his stovepipe hat and somber black clothes, the pallid Drake formed a picturesque contrast with this wilderness setting. Despite the enticing traces of oil that stained the creek's surface, the search for significant oil deposits, without geological knowledge of underground oil structures, proved a long and frustrating one. While the locals found Drake charming and sociable and supplied with a good repertoire of stories, they also mocked him as a harebrained dreamer, seized by a wild obsession. When he tried to dig for oil, the walls caved in. Then, borrowing a method used for salt wells, he started to drill for oil. In this inhospitable setting, choked with underbrush, it was a feat just to assemble the necessary machinery and erect a strange, tall, wooden structure known as a derrick. On Sunday, August 28, 1859, Drake's folly was rewarded when oil bubbled up from a well drilled a day earlier. It was less a matter of Drake discovering oil—its existence was scarcely a secret—than of his figuring out a way to tap commercial quantities in a controlled process so that it could be pumped from the earth in systematic fashion.

*Laura Celestia Spelman, always known to friends as "Cettie." (Courtesy of the Rockefeller Archive Center)*

Drake's feat touched off pandemonium as bands of fortune seekers streamed into Titusville and its pastoral surroundings. Speculators scrambled over the greasy slopes of the creek, leasing acreage from unsophisticated, often unlettered, owners; one farmer turned down an offer of a one-quarter royalty and stubbornly held out for a one-eighth share. Pretty soon derricks sprouted everywhere along the dark, narrow valley, the drilling scarring and denuding the once lush forest slopes. Drilling was the first step in an extended production chain. Within a year of Drake's discovery, a dozen ramshackle

refineries sprang up along the creek's steep, secluded banks. Inevitably, this tumultuous activity attracted notice in Cleveland, which had the advantage of proximity to northwest Pennsylvania. Even in those days of slow transport, one could travel from Titusville to Cleveland in a day. Several Cleveland businessmen were already refining illuminating oil from bituminous coal and were naturally interested in a rival method. On November 18, 1859, nearly three months after Drake's find, the *Cleveland Leader* reported on the mad hubbub around Titusville, saying that "the oil springs of northern Pennsylvania were attracting considerable speculation" and that there was "quite a rush to the oleaginous locations." Among the first Clevelanders descending upon the area was a produce merchant named James G. Hussey, who was a former boss of Rockefeller's partner, Maurice B. Clark, and he came home with ecstatic stories about the riches to be made.

We don't know what Rockefeller thought of Drake's breakthrough at the time, but years later, having harvested his unparalleled fortune from oil, John D. Rockefeller saw a large and providential design in the discovery of Pennsylvania oil, stating that "these vast stores of wealth were the gifts of the great Creator, the bountiful gifts of the great Creator." He expressed his gratitude that "Colonel Drake and the Standard Oil Company and all others connected with this industry had the opportunity for useful work in preparing and distributing this valuable product to supply the wants of the world."<sup>1</sup> As we shall see, Rockefeller always viewed the industry through this rose-tinted spiritual lens, and it materially aided his success, for his conviction that God had given kerosene to suffering mankind gave him unswerving faith in the industry's future, enabling him to persist where less confident men stumbled and faltered.

For all his later evangelical fervor about oil, John D. Rockefeller didn't behold its potential in a sudden revelatory flash but made an incremental transition from produce to oil. Clark and Rockefeller might have taken on consignment some of the first crude-oil shipments that reached Cleveland in early 1860, but it was the friendship between Maurice Clark and Samuel Andrews, an Englishman from Clark's hometown in Wiltshire, that drew Rockefeller into the business. A hearty, rubicund man with a broad face and genial manner, Andrews was a self-taught chemist, a born tinkerer, and an enterprising mechanic. Arriving in Cleveland in the 1850s, he worked in a lard-oil refinery owned by yet another Englishman, C. A. Dean, and acquired extensive experience in making tallow, candles, and coal oil. Then, in 1860, Dean got a ten-barrel shipment of Pennsylvania crude from which Andrews distilled the first oil-based kerosene manufactured in Cleveland. The secret of "cleansing" oil with sulfuric acid—what we now term refining—was then a high mystery, zealously guarded by a local priesthood of practical chemists, and many curious businessmen beat a path to Andrews's door.

An expert on illuminants enthralled by the unique properties of kerosene, Andrews was convinced it would outshine and outsell other sources of light. Finances were tight in the Andrews household—his wife took in sewing to supplement his income—but by 1862, Sam was plotting to leave Dean and strike out on his own. On the lookout for backers, he frequently dropped by the offices of Clark and Rockefeller. In another instance of the worldly advantages of his religious affiliations, Rockefeller knew Andrews and his wife from the Erie Street Baptist Mission Church. When Andrews started talking about oil refining, the dubious Clark cut short his perfervid talk: "I told him there was no chance, that John and I together did not have more than \$250 we could spare out of our business; we simply had enough working capital, together with our credit at the banks, to enable us to make advances to consignors, paying insurance and rent."<sup>2</sup> Stymied by one partner, Andrews barged into Rockefeller's office and resumed his sales pitch. Already so flush that he had invested in his first railroad stock, with cash to spare for the firm, Rockefeller was far more receptive. After one chat with Rockefeller, Andrews went back into the warehouse to badger Clark. "I started to shut him off," recalled Clark, "but when he said, 'Mr. Rockefeller thinks well of it,' I impulsively replied, 'Well, if John will go in I will.'<sup>3</sup> With becoming modesty, Rockefeller later interpreted his own role as more passive, even skeptical toward the fateful oil venture and said that Maurice Clark's two brothers, James and Richard, were such oil enthusiasts that he had been railroaded into refining by the combined pressure of the three Clarks and Sam Andrews.

Whatever the truth, Rockefeller and Maurice Clark pledged \$4,000 for half the working capital of the new refining venture, Andrews, Clark and Co., placing the twenty-four-year-old Rockefeller squarely in the oil business in 1863, the year of the Emancipation Proclamation and the stunning Union victories at Gettysburg and Vicksburg. Of the initial \$4,000 investment, he said dryly, "It seemed very large to us, very large."<sup>4</sup> Scarcely dreaming that oil would ever supersede their main commodity business, they considered it "a little side issue, we retaining our interest in our business as produce commission merchants."<sup>5</sup> As a commission agent distant from the oil wells, stationed at the commercial crossroads of Cleveland, Rockefeller naturally entered the industry as a refiner. As a middleman, he belonged to a new breed of people in the emerging industrial economy who traded, refined, or distributed products in the widening chasm that separated raw-material producers in the countryside from their urban consumers.

The spot chosen for the new refinery tells much in miniature about Rockefeller's approach to business. He exercised an option on a three-acre parcel on the sloping, red-clay banks of a narrow waterway called Kingsbury Run, which flowed into the Cuyahoga River and thus provided passage to Lake Erie. A mile and a half from downtown Cleveland, it seemed at first glance an inauspicious site for the new refinery, christened the Excelsior Works. In these bucolic outskirts beyond the city limits, cows browsed peacefully, and trees still shaded the waterway. But for Rockefeller, the inconvenience was outweighed by the fact that it would soon adjoin new railroad tracks. On November 3, 1863, proudly flying the Union colors, a gleaming locomotive of the Atlantic and Great Western Railroad pulled into a Cleveland station decked with bunting and launched a new era, giving the town access to New York City via the Erie Railroad and to a valuable direct route to the Pennsylvania oil fields. Able to ship by water or over land, Rockefeller gained the critical leverage he needed to secure preferential rates on transportation—which was why he agonized over plant locations throughout his career.

Before long, a string of other refineries had sprouted along Kingsbury Run. With a population of about 44,000, Cleveland was full of dynamic young men struggling to get ahead, and oil refining presented a rare chance to parlay a small investment into a huge fortune. It cost a pittance—as little as \$1,000, or less than the cost of opening a well-stocked store—to construct a small refinery and hire hands to run it. By mid-1863, twenty refineries operated in the Cleveland area and shipped a quarter of their kerosene abroad. At first, the profits came in so thick and fast that everybody—big and small, clever and inept—made handsome profits without the fierce winnowing of adversity, the stern lash of marketplace discipline. Rockefeller sarcastically alluded to these palmy days as "the harvest time in which such large profits were reaped by the saloon-keepers and preachers and tailors and men from all the walks of life who were fortunate enough to find an oil still."<sup>6</sup> Oil was put to myriad uses during the Civil War, treating the wounds of Union soldiers and serving as a substitute for turpentine formerly supplied by the South. Even on the battlefield, the use of kerosene refined from crude oil spread, and Ulysses S. Grant often sat in his tent, drafting dispatches by the flicker of a kerosene lamp.

Later on, Rockefeller became so embittered toward Sam Andrews that he denigrated him, quite unjustly, as the expendable figure in the Standard Oil saga. “Samuel Andrews was taken into the business as a poor workingman with little or nothing in the early stages when it was difficult to find men to cleanse the oil. . . . He had too much conceit, too much bull-headed English obstinacy and so little self-control. Was his own worst enemy.”<sup>7</sup> This verdict, rendered much later, was darkly tinged by intervening events, but in the beginning Andrews enjoyed cordial relations with Rockefeller. Andrews knew nothing of business but was content to let Maurice Clark and Rockefeller mind the office while he acted as refinery boss. Reversing Rockefeller’s harsh judgment, Ida Tarbell went so far as to label Andrews “a mechanical genius” who had improved the quality of the kerosene and the percentage of it yielded by each barrel of crude oil.<sup>8</sup>

In the early days, Rockefeller wasn’t so detached from the practical side of refining as when his empire later grew and he withdrew into the impregnable fortress of his office. Devoid of superior airs, he was often seen at Kingsbury Run at 6:30 A.M., going into the cooper shop to roll out barrels, stack hoops, or cart out shavings, reflecting the thrift inculcated by his mother and his puritanical religious upbringing. Since a residue of sulfuric acid remained after refining, Rockefeller drew up plans to convert it to fertilizer—the first of many worthwhile and extremely profitable attempts to create by-products from waste materials. Shaped by a childhood of uncertainty, he aspired to be self-sufficient in business no less than in life and reacted to a perpetual shortage of barrels by deciding to build his own. Disgusted by a suspicious error in a plumber’s bill, he told Sam Andrews, “Hire a plumber by the month. Let us buy our own pipes, joints, and all other plumbing material.”<sup>9</sup> The refinery also did its own hauling and loading. Such was Rockefeller’s ingenuity, his ceaseless search for even minor improvements, that within a year refining had overtaken produce as the most profitable side of the business. Despite the unceasing vicissitudes of the oil industry, prone to cataclysmic booms and busts, he would never experience a single year of loss.

If Rockefeller entered the refining business with some reservations, he soon embraced it as the big, bold opportunity he had craved. Never one to do things halfway, he plunged headlong into the business, and his enthusiasm overflowed into his home life. Sharing a room with brother William, he often nudged him awake in the dead of night. “I’ve been thinking out a plan to do so and so,” he would ask. “Now, what do you think of this scheme?”<sup>10</sup> “Keep your ideas till morning,” Will would sleepily protest. “I want to sleep.”<sup>11</sup> In the predawn dark, John usually chatted with Maurice Clark and Sam Andrews at Cheshire Street, where they talked interminably of oil. As John’s sister Mary Ann observed, the older men deferred to him instinctively. “They did not seem to want to go without him. They would . . . walk in and visit in the dining room while John was at breakfast.” She found the infatuation with oil repugnant, screening out the dreadful carnage of the Civil War. “I got sick of it and wished morning after morning that they would talk of something else.”<sup>12</sup>

Rockefeller leaped into oil with a zest reminiscent of his absorption in the Baptist Church. He lovingly tended his refinery much as he had swept the chapel floor, a parallel not lost on contemporaries. Said Maurice Clark: “John had abiding faith in two things—the Baptist creed and oil.”<sup>13</sup> This very old, very young man found boyish pleasure in doing business, and when he captured a large contract, he strutted and whooped with a buoyant step or cut a small comic caper. As one early associate remarked, “The only time I ever saw John Rockefeller enthusiastic was when a report came in from the creek that his buyer had secured a cargo of oil at a figure much below the market price. He bounded from his chair with a shout of joy, danced up and down, hugged me, threw up his hat, acted so like a madman that I have never forgotten it.”<sup>14</sup> These isolated joyful outbursts only underscored the usual constriction of his personality.

Rockefeller’s overwhelming influence on the oil industry stemmed from the conflict between his overmastering need for order and the turbulent, unruly nature of the infant industry. In the overheated memories of his enemies, Rockefeller became an omnipresent bogeyman who first appeared in the Oil Regions—the name given to the area along Oil Creek that encompassed Titusville, Oil City, and Franklin—not long after Drake’s discovery. One legend, rehashed by several early biographers, was that Rockefeller went to Titusville in 1860 to represent a group of Cleveland capitalists and advised them to refrain from the business, citing the uncertain flow of oil. In truth, Rockefeller testified, “I was engaged in the business when I took the trip; that was why I took the trip, to see about a supply of oil for my refinery.”<sup>15</sup>

To reach his destination, he had to travel first by rail and then by stagecoach to penetrate the dark forests and wooded hills along Oil Creek. Despite the spot’s isolation—news of Fort Sumter’s fall took four days to arrive—so many adventurers descended upon the area that train aisles were jammed with newcomers while others squatted on the roof. It was no place for the squeamish. To reach the railroad, oil had to be carted in barrels across more than twenty miles of rough backcountry, a trade serviced by thousands of brawling, swearing teamsters with shaggy beards and slouch hats who charged extortionate rates. (The Pennsylvania barrel, equal to forty-two gallons, remains the industry standard to this day.) Sometimes oil-laden wagons stretched in interminable caravans along the rutted roads. Many barrels tipped over and smashed, making the hills treacherous. During wet seasons, the mud grew so thick that teamsters often took two horses, one to pull the other out when it invariably got stuck. Horses were routinely lashed to death with heavy black whips as they pulled enormous loads through the black muck. Left to die by the roadside, their hides and hair were eaten away by petroleum chemicals, leaving ghastly, corroded carcasses strewn across the landscape. Transport by water was no less revolting. Oil Creek flowed into the Allegheny River, where hundreds of flatboats and steamers handled the cargo traffic. Sometimes oil barrels were loaded on barges and floated down to Pittsburgh on man-made freshets produced by suddenly releasing water stored behind floodgates. “Lots of oil was lost by the capsizing of barges and smashing of barrels in the confusion and crush of the rafts,” said Rockefeller.<sup>16</sup> By 1863, the Allegheny, befouled with oil, actually caught fire and burned a bridge in Franklin.

Tramping the banks, Rockefeller beheld the satanic new world bequeathed by the oil boom, an idyllic valley blackened with derricks and tanks, engine houses and ramshackle huts, thickly crowded together in a crazy-quilt pattern. Boomtowns appeared briefly, witnessed frantic activity, then vanished as abruptly as they had appeared. Rockefeller saw something slapdash about the industry. “You will remember that the business in its early years was a sort of gold-field rush,” he reminisced. “Great fortunes were made by some of the first adventurers, and everything was carried on in a sort of helter-skelter way.”<sup>17</sup> Rockefeller represented the second, more rational stage of capitalist development, when the colorful daredevils and pioneering speculators give way, as Max Weber wrote, to the “men who had grown up in the hard school of life, calculating and daring at the same time, above all temperate and reliable, shrewd and completely devoted to their business, with strictly bourgeois opinions and principles.”<sup>18</sup>

By the time Rockefeller arrived in the Oil Regions, it looked as if the oil would be more than a transient phenomenon. In September 1861, two Clevelanders brought in the Empire Well, the first mighty gusher, which rose “higher than steeples,” in the evocative words of one observer, yielding three thousand barrels of oil per day.<sup>19</sup> To onlookers, there was something uncanny about this towering jet of oil. So fast did the Empire Well flow that its owners could scarcely find barrels to carry it off, and people came running with pails, dippers, cups, and buckets to scoop up the black gold. A sudden oil glut sent prices skidding to ten cents a barrel even as teamsters continued to charge \$3 or \$4 per barrel to ship it to the railroads. From its first days, the industry tended to oscillate between extremes: gluts so dire that prices plummeted below production costs, or shortages that sent prices skyward but raised the even more troubling specter of the oil running dry.

Among the many tales of Rockefeller’s first trip to the oil fields, one told by Franklin Breed, a Titusville producer, has a ring of authenticity. He and Rockefeller rode on horseback through the valley to reach Breed’s well, then negotiated the final half mile on foot. As Breed later wrote:

*It was necessary to cross a bayou of five or six feet in width and probably four feet deep. This bayou contained sediment which the oil men took from the bottom of the tanks. This, with mud in the bayou, resembled tar. Spanning the bayou was a six inch log. . . . I was used to crossing on it but Rockefeller declared he could not walk on it. He did, however, and he fell off. . . . He looked up at me with a smile and said, “Well, Breed, you have got me into the oil business head and ears.”*<sup>20</sup>

In talking to the hard-bitten wildcatters, Rockefeller must have seemed standoffish and self-possessed, but he professed to enjoy their company, calling them “pleasant fellows, the same type we meet in the mining regions, jolly, good-natured, happy-go-lucky.”<sup>21</sup> The description is not without a note of condescension. But he listened closely to what people said and filed away as much information as he could, repeating valuable information to himself until it was memorized. There was humility in this eagerness to learn. As he said, “It is very important to remember what other people tell you, not so much what you yourself already know.”<sup>22</sup>

However stimulated by the money to be made, Rockefeller was appalled by the loose morals of a place infested with cardsharps and prostitutes and already dubbed “Sodden Gomorrah.”<sup>23</sup> The wildcatters were so rowdy, said a visitor, that throughout the area you could hear “the slap of cards on whiskey-stained tables of groggeries.”<sup>24</sup> Another visitor marveled at the universal dissipation and reported, “The orgies in Petroleum Centre sometimes eclipsed Monte Carlo and the Latin Quarter combined.”<sup>25</sup> For a sober, pious Christian such as Rockefeller, this world of brawny men addicted to vice must have seemed infernal. The oilmen walked around in tall boots, leaving black footprints in the brothels, taverns, and gambling houses of Titusville and Oil City. Many flaunted their nouveau-riche excesses, wearing high silk hats, diamond stickpins, and gold watch chains. In travelers’ reports, it is striking how frequently people resorted to hellish imagery to capture the mood. Rockefeller’s trips to the Oil Regions must have strengthened his belief that he stood foursquare for virtue in a godforsaken place. As an ardent temperance advocate, he was extremely uncomfortable around drinkers—perhaps one reason why he seldom visited the oil fields.

Two stories, both of uncertain authenticity, convey Rockefeller’s disdain for the morals prevalent among many producers. One night in Rouseville, a local committee of vigilantes crept up to a flatboat moored to a bank and filled with ladies of easy virtue and whiskey salesmen; at the height of a bacchanal, they cut the boat loose and sent the sinners twenty miles downriver. It is said that Rockefeller “thoroughly approved” of the action.<sup>26</sup> Another story tells of the time he stayed in Franklin, where he boarded at the Exchange Hotel and liked to have bread and milk for supper. Occasionally, he donned a dingy old suit to help his men load barrels. One Sunday, an employee came rushing in to tell Rockefeller that the river was rising dangerously and might sweep away their barrels. Rockefeller, preparing for church, put on his hat with aplomb, said he had to go to prayer, and refused to attend to business. Perhaps Rockefeller really did have God on his side, for his barrels survived the flooding intact.<sup>27</sup>

Drilling for oil often seemed less an industry than a lottery: Nobody knew if oil would prove a lasting benefit to mankind or an evanescent wonder. If the Oil Regions created many millionaires, they left many more paupers. Instead of building up an industry, most producers preferred to drain their wells as quickly as possible in this harum-scarum atmosphere. Under the so-called rule of capture, people could drill diagonally and siphon off a neighbor’s oil, adding to their haste to pump. Rockefeller succeeded because he believed in the long-term prospects of the business and never treated it as a mirage that would soon fade. Rockefeller’s first visit to Pennsylvania must also have persuaded him that he had picked the right entry point to the business. Searching for oil was wildly unpredictable, whereas refining seemed safe and methodical by comparison. Before too long, he realized that refining was the critical point where he could exert maximum leverage over the industry.

John D. Rockefeller had an unfailing knack for knowing who would help or hinder him in his career, an instinct only sharpened by time. Sensitive to patronizing behavior, he bridled when anyone tried to lord it over him, and he wanted to be dealt with as a peer even by senior men. Recoiling at what he saw as the Clark brothers’ pomposity, he eventually grew as censorious of them as he had been of George Gardner. The Clarks were the first of many business partners to underrate the audacity of the quietly calculating Rockefeller, who bided his time as he figured out how to get rid of them.

All along, crosscurrents had ruffled his relationship with Maurice B. Clark, whom he dismissed as “an ignorant, conceited Englishman.”<sup>28</sup> A tall, bluff man with a fiery temper and shadowy past, Clark had started out as a gardener in his native Wiltshire, chafing under a tyrannical boss. One day in 1847, he reared up and flattened the man. Fearing arrest, he fled to Boston as a penniless, uneducated fugitive from justice. He migrated west to Cleveland and worked as a woodchopper and teamster before entering the produce business. More of a free spirit than Rockefeller, Clark smoked, drank, and swore freely in the warehouse and showed scant religious interest. The personality profile didn’t appeal to Rockefeller, who bristled at Clark’s profanity, but he praised him as a smart, hustling businessman.

Because Rockefeller had such respect for ledgers, Clark, nearly ten years older, looked down on him as a mere clerk, a rigid, blinkered man without vision. “He did not think I could do anything but keep accounts and look after the finances,” said Rockefeller.<sup>29</sup> “You see, it took him a long time to feel that I was no longer a boy.”<sup>30</sup> He thought Clark envious of his success in soliciting business on the road, perhaps because this undercut Clark’s image of him as an expendable clerk. At first, Rockefeller swallowed his anger and stoically endured this injustice. “He tried almost from the beginning of our partnership to dominate and override me,” he said of Clark. “A question he asked several times in our discussion of business matters was, ‘What in the

world would you have done without *me*?" I bore it in silence. It does no good to dispute with such a man."<sup>31</sup> Rockefeller had no doubt who was contributing the lion's share of business. "I was the one who made the firm's success. I kept the books, looked out for the money."<sup>32</sup> As part of Rockefeller's silent craft and habit of extended premeditation, he never tipped off his adversaries to his plans for revenge, preferring to spring his reprisals on them.

The investment in oil refining had brought Maurice's brother James into the office, and Rockefeller came to detest him. An ex-prizefighter, James Clark was a powerful, bullying young man, and he tried to intimidate Rockefeller, who responded with great sangfroid and courage. One morning, James burst into his office and started swearing violently at Rockefeller, who put his feet up on the desk with imperturbable poise and showed no sign of upset; a fine actor, he always had masterful control of his facial muscles. When James finished, Rockefeller said evenly, "Now James, you can knock my head off but you might as well understand that you can't scare me."<sup>33</sup> This fearless young man couldn't be intimidated. After that confrontation, James Clark didn't rant and bluster as much around Rockefeller, but it was clear that they were incompatible colleagues.

As with Maurice, Rockefeller quarreled with James about business methods and was dismayed by his devious side deals in oil. When James boasted about swindling a former boss or cheating people on buying trips to Pennsylvania, it must have aroused Rockefeller's innermost suspicions, for he closely audited his partner's expenses. Like Maurice, James smarted at Rockefeller's self-righteousness and branded him the "Sunday-school superintendent."<sup>34</sup> Already contemplating the future, Rockefeller wanted to be surrounded by trustworthy people who could inspire confidence in customers and bankers alike. He drew a characteristic conclusion: The weak, immoral man was also destined to be a poor businessman. "We were beginning to prosper and I felt very uneasy at my name being linked up with these speculators."<sup>35</sup> Later on, the Clarks fully reciprocated this contempt, with James describing Rockefeller's sole contribution to Andrews, Clark as that of a "financial manipulator" and claiming that in 1863 Rockefeller had cheated him of several thousand dollars.<sup>36</sup>

If their differences had been chiefly a clash of personalities, Rockefeller's partnership with Maurice Clark might have lasted years, but they had sharply divergent views about oil's future and the desirable pace of expansion. Despite the Civil War, the drills never stopped in Pennsylvania, except when General Lee invaded the state and producers had to defend it. As the export business in kerosene widened, Andrews, Clark banked solid profits in refining during every year of the war. Yet prices remained as volatile as the war itself, with the supply-demand equation shifting radically each time a single spouter or gusher came in. Amid the ruthlessly competitive conditions, it was never clear where prices would settle or what constituted a normal price. The price fluctuations in a single year were staggering, veering between 10¢ and \$10 a barrel in 1861 and \$4 and \$12 in 1864. Undeterred by these extreme gyrations, both Rockefeller and Andrews wanted to borrow heavily and expand, while Clark favored a more circumspect approach.

What likely clinched Rockefeller's decision to break from the three Clarks was that they had the votes to override him and Andrews and didn't hesitate to use their majority in a high-handed way. In later reminiscences, Rockefeller disclosed an incident that casts light on his relations with the Clarks: "[Maurice Clark] was very angry when I borrowed money to extend our business of refining oil. 'Why, you have borrowed \$100,000,' he exclaimed, as if that were some sort of offense."<sup>37</sup> Rockefeller's amazement seems somewhat disingenuous: It was a stupendous sum, but all Rockefeller could see was that Maurice Clark lacked his audacity. "Clark was an old grandmother and was scared to death because we owed money at the banks."<sup>38</sup> One can forgive the Clarks if they found something overbearing about this bumptious young man who would risk all their capital, evidently without notifying them. Significantly, the Clarks were irked by both Rockefeller's frugality *and* his prodigality—his tightfisted control of details and advocacy of unbridled expansion. Daring in design, cautious in execution—it was a formula he made his own throughout his career.

By 1865, Rockefeller, age twenty-five, decided it was time for a showdown with the Clarks. He wasn't the sort to persist in a flawed situation, and he was now prepared to clear away the encumbrances that had thwarted his early career.

For Rockefeller, success in the oil business required a bullish, nearly glandular faith in its future. Before deciding to enter the business on a large scale, he needed one last God-given proof that the oil wouldn't disappear—decisive evidence that came in January 1865 at a place called Pithole Creek. The nearby rocks and chasms had always emitted sulfur gas and attracted the notice of oilmen. One day, a group of eccentric producers, waving a witch-hazel twig serving as a divining rod, drilled on the spot where the twig dipped down. When a tremendous gusher spouted up days later, another madcap chapter in the oil industry commenced, with speculators, drillers, and business agents converging on the spot. Within a few months, the sleepy frontier settlement with four log cabins was transformed into a hectic little metropolis of twelve thousand people. Overnight, fifty hotels sprang up, along with a theater that seated one hundred and was lit by crystal chandeliers. So improbable was Pithole's rise that it seemed a phantom city, a conjurer's trick. "It was more than a city," says one chronicler, "it was a state of postwar euphoria."<sup>39</sup> Even by the sordid standards of the Oil Regions, it was a disreputable place. "Every other shop is a liquor saloon," said one journalist. "It is safe to assert that there is more vile liquor drunk in this town than in any other of its size in the world."<sup>40</sup>

One eyewitness to the whole Pithole lunacy was an observant eight-year-old girl named Ida Minerva Tarbell, who lived ten miles away in Rouseville and saw hordes of eager men streaking to the boomtown. When her father built an oil-tank shop there, he made the fastest money of his life. Unfortunately, Pithole's ebullient heyday was short-lived, and within a few years its wells were exhausted from fire and overproduction. Before the town reverted back to sylvan peace, people began to scavenge for scrap. For \$600, Ida Tarbell's father bought the fancy Bonta House hotel, constructed a few years earlier for \$60,000, and carried off its lumber, doors, and windows to erect a home for the Tarbell family in Titusville. By 1874, the moment of its greatness having flickered, Pithole counted just six voters.

In hindsight, Pithole was a cautionary fable of blasted hopes and counterfeit dreams, renewing fears of the industry's short life span. But in January 1865, it suggested that there were many undiscovered pockets of oil, and it probably acted as a catalyst that hastened Rockefeller's break with the Clarks. This parting was vintage Rockefeller: He slowly and secretly laid the groundwork, then moved with electrifying speed to throw his adversaries off balance. That January, Maurice Clark had openly fumed when Rockefeller asked him to sign yet another note. "We have been asking too many loans in order to extend this oil business," Clark said. Undaunted, Rockefeller shot back: "We should borrow whenever we can safely extend the business by doing so."<sup>41</sup> Trying to intimidate Rockefeller, the Clark brothers threatened to dissolve the partnership, which required the unanimous consent of all the

partners.

Determined to break loose from the Clarks and the commission business, Rockefeller sounded out Sam Andrews privately and told him:

*Sam, we are prospering. We have a future before us, a big future. But I don't like Jim Clark and his habits. He is an immoral man in more ways than one. He gambles in oil. I don't want this business to be associated with a gambler. Suppose I take them up the next time they threaten a dissolution. Suppose I succeed in buying them out. Will you come in with me?*<sup>42</sup>

When Andrews agreed, they shook hands on the deal.

A few weeks later, just as Rockefeller expected, he quarreled with Maurice Clark, and the latter threatened to dissolve the partnership. “If that’s the way you want to do business we’d better dissolve, and let you run your own affairs to suit yourself,” Clark warned.<sup>43</sup> Moving swiftly to implement his scenario, Rockefeller invited the partners to his home on February 1, 1865, and vigorously expounded a policy of rapid refinery expansion—a policy he knew was anathema to the Clarks. Playing right into Rockefeller’s hands, James Clark tried to browbeat him. “We’d better split up,” he declared.<sup>44</sup> In conformity with the partnership agreement, Rockefeller got everyone to state publicly that he favored dissolution, and the Clarks left imagining they had cowed Rockefeller. In fact, he raced to the office of the *Cleveland Leader* and placed a notice in the morning paper dissolving the partnership. The next morning, when the Clarks saw it, they were stunned. “Do you really mean it?” an incredulous Maurice Clark asked Rockefeller. He hadn’t realized before that Rockefeller had lined up Andrews on his side. “You really want to break it up?” “I really want to break it up,” replied Rockefeller, who had sounded out sympathetic bankers in the preceding weeks.<sup>45</sup> It was agreed that the firm would be auctioned to the highest bidder.

Even as a young man, Rockefeller was extremely composed in a crisis. In this respect, he was a natural leader: The more agitated others became, the calmer he grew. It was an index of his matchless confidence that when the auction occurred, the Clarks brought a lawyer while Rockefeller represented himself. “I thought that I could take care of so simple a transaction,” he boasted.<sup>46</sup> With the Clarks’ lawyer acting as auctioneer, the bidding began at \$500 and quickly rose to a few thousand dollars, then inched up slowly to about \$50,000—already more than Rockefeller thought the refining business worth. Since this auction was a turning point on his road to industrial supremacy, let us quote his account of the historic moment as he related it in his memoirs:

*Finally it advanced to \$60,000, and by slow stages to \$70,000, and I almost feared for my ability to buy the business and have the money to pay for it. At last the other side bid \$72,000. Without hesitation I said \$72,500. Mr. Clark then said: “I’ll go no higher, John; the business is yours.” “Shall I give you a check for it now?” I suggested. “No,” Mr. Clark said, “I’m glad to trust you for it; settle at your convenience.”*<sup>47</sup>

Rockefeller knew the moment was fraught with consequences. “It was the day that determined my career. I felt the bigness of it, but I was as calm as I am talking to you now,” he told William O. Inglis.<sup>48</sup> He paid a lofty price for his freedom, surrendering to Clark his half interest in the commission business along with the \$72,500. (The purchase price would be equivalent to \$652,000 today.) Yet he had captured a tremendous prize. At age twenty-five, he had won control of Cleveland’s largest refinery, which could treat five hundred barrels of crude oil daily—twice the capacity of its nearest local rival—and ranked as one of the world’s largest facilities. On February 15, 1865, the *Cleveland Leader* printed the following item: “Copartnership Notice—The undersigned, having purchased the entire interest of Andrews, Clark & Co. in the ‘Excelsior Oil Works,’ and all the stock of barrels, oil, etc., will continue the business of the late firm under the name of Rockefeller & Andrews.”<sup>49</sup> Rockefeller savored his revenge against the Clarks, who were shocked that their junior partner had lined up, on the sly, financing for such a large deal, and Rockefeller gloated at the older men’s complacent naïveté. “Then [the Clark brothers] woke up and saw for the first time that my mind had not been idle while they were talking so big and loud.”<sup>50</sup> All of Rockefeller’s Baptist contempt for vanity, show, and loose talk is condensed in that single observation. On March 2, 1865, Clark and Rockefeller was also dissolved, and Rockefeller eliminated the three fractious Clark brothers from his life forever.

For Rockefeller, the harrowing memory of the Clarks stayed with him, and he talked as if he had survived a nightmare. “The sufferings I went through in those years, the humiliation and the anguish, I have not words to describe. And I ever point to the day when I separated myself from them by paying this large bonus as the beginning of the success I have made in my life.”<sup>51</sup> It’s hard to know whether Rockefeller exaggerated the Clarks’ haughtiness, but the important points are that he was proud and sensitive and that their barbed words reverberated deeply in his mind. Having emerged as his own boss, he would never again feel his advancement blocked by shortsighted, mediocre men.

The demise of Clark and Rockefeller unfolded against the waning days of the Civil War. By December 1864, General Sherman had reached Savannah and swung north through the Carolinas. About two months after Rockefeller won the refining business, Robert E. Lee surrendered to Ulysses S. Grant at Appomattox Courthouse. As a town that had sheltered many runaway slaves before the war, Cleveland was especially grieved by the subsequent news of Lincoln’s assassination. On April 27, the funeral train brought his body to lie in state for several hours in a special mortuary pavilion, with women in spotless white robes gathering by the railroad tracks to sing choral dirges to the slain president.

By this point, the new firm of Rockefeller and Andrews had been installed on the second floor of a brick building on Superior Street, several blocks from the Cuyahoga River, in an office complex known as the Sexton Block. From his new command post, the young entrepreneur could stare out the window and follow the progress of barges drifting by laden with oil barrels from his refinery. Already a mature businessman, he relied on Andrews only as a technician and assumed control of all other aspects of the business. Having discarded several older partners, the young man had no real business mentors, heroes, or role models and was beholden to no one. John D. Rockefeller was not only self-made but self-invented and already had unyielding faith in his own judgment.

For all his resoluteness as a young businessman, Rockefeller tarried in settling his private life. Yet he had already fathomed his own needs and sought a woman who would be pious and loving, dedicated to the church, and strongly supportive of his career. Because of his easy, affectionate way with his mother, Rockefeller felt comfortable with women, took genuine pleasure in their company, and, unlike the caddish Bill, treated them with respect.

During his brief period at Central High School, Rockefeller had befriended two bright, literate sisters, Lucy and Laura Celestia Spelman, and taken a special fancy to Laura, or “Cettie,” as she was called. Though he still had an awkward manner with girls, the sisters saw a warm, likable side to him. Unlike most other girls at the school, the practical-minded Cettie was taking commercial courses to master business principles, and she applauded John in his storied 1855 job search. As a friend of Cettie’s later noted, “She saw that he was ambitious, and she thought that he was honest, which probably appealed to her more than anything else.”<sup>52</sup> Clearly, she transmitted to John the message that his chances of winning her would be materially enhanced if his economic prospects improved.

There seems little doubt that in courting Cettie, John was held back by the disparity in their socioeconomic status, which accounts for the nine-year hiatus between their first meeting in high school and their 1864 marriage. The Spelmans were high-toned people, a blue-ribbon family living in a fine house. A friend of Laura’s recalled, “Perhaps Cettie wasn’t exactly rich and beautiful, but her father was as well off as any of the girls in our class, a member of the Ohio legislature, and somewhat known for his philanthropic work, so—you know how those things are among children—we thought that it was strange for her to rather show a leaning toward Johnny.”<sup>53</sup> It’s easy to see what drew John to Laura aside from patent compatibility, for the Spelmans signified the respectability that had so frustratingly eluded his own family.

Civic-minded, stirred to action by social injustice, the Spelmans offered more than entrée into the local gentry and were a family of genuine substance. Born in Massachusetts, Harvey Buel Spelman, a direct descendant of the Puritans, and Lucy Henry met in Ohio and were married in 1835, giving birth to Laura Celestia on September 9, 1839. When they moved to Akron in 1841, they lived humbly at first, with Mrs. Spelman taking in washing to extend their income; Cettie, as a little girl, sometimes yanked a small red wagon around town to deliver laundry. Even when Harvey Spelman opened a dry-goods store and amassed considerable wealth, he and Lucy didn’t retreat into private pleasures but redoubled their militant reform efforts. As a member of the local board of education, Harvey Spelman spearheaded the creation of a progressive public-school system, a crusade that propelled him into the Ohio state legislature in 1849. Also busy in church causes, the Spelmans helped to found a Congregational church in Akron. Their religious beliefs buttressed their secular activism, and they were pledged to root out evil as part of both their religious and political agendas.

With his broad forehead, tufty brows, and pugnacious beard, Harvey Buel Spelman was a man of burning fundamentalist convictions and apocalyptic musings. He frequently discerned God’s hand smiting the American people for their wicked extravagance, and he issued flaming diatribes against demon rum: “The widespread and excessive use of rum is the tinder which inflames the worst passions in human nature, fosters riots, Communism and strikes, promotes ignorance, vice and crime, and more than any other cause, threatens the stability of our free institutions,” he said in 1879.<sup>54</sup> Lucy Henry, his dignified, industrious wife, enjoyed singing hymns and had little time for small talk, though she could be jolly with her daughters. “At any reference to the Bible, to temperance, to education, to the widening sphere of women, her eyes flashed with old-time fire, and her face was aglow with conviction,” a preacher said, with pardonable hyperbole, at her funeral.<sup>55</sup>

As an outgrowth of their church involvement—and this was true of many evangelicals after the Second Great Awakening—Harvey and Lucy were uncompromising abolitionists and temperance activists. With their home serving as a station on the Underground Railroad, they shepherded many slaves from Tennessee and Kentucky to freedom, and Sojourner Truth, the former slave, abolitionist, and itinerant preacher, spent several days with them. According to Cettie, the only time she ever saw her mother cooking on the Sabbath was to prepare hot meals for slaves in flight to Canada. The Spelmans felt no less ardently about drink. The crusading Mrs. Spelman not only marched in the streets but stormed the saloons, dropped to her knees in prayer, and pleaded with sinners at the bar stools to mend their ways, while Mr. Spelman carried on a parallel campaign to shut down rum shops.

The Spelmans’ prosperous life in Akron ended in 1851 when Mr. Spelman’s business went bankrupt, the casualty of a bank panic. The family then moved to Cleveland, where Mr. Spelman’s fortunes revived, but a dark edge of economic uncertainty always shadowed the family. So while the Spelmans occupied a higher social rung than young Rockefeller, they were haunted by the prospect of economic misfortune and inclined to look favorably upon an up-and-coming suitor with a proper Christian pedigree. Cettie needed to find a husband who could safeguard her family’s security, so it is not surprising that she championed John’s career and eagerly coached him to succeed from the start.

It is hard to picture a young woman more perfectly suited to John D. Rockefeller’s values than the sensible, cheerful Laura Celestia Spelman, who shared his devotion to duty and thrift. They ratified each other’s views about the fundamentals of life. Two months younger than John, Cettie was short and slender, with a round face, dark brown eyes, and a wealth of chestnut hair parted down the middle and smoothly pulled back from her forehead. Rockefeller would never have tolerated a noisy woman, and Cettie was soft in voice and manner. Like John, though, her mild surface belied an adamant determination. She was “gentle and lovely, but resolute with indomitable will,” noted her sister Lucy, better known in the family as Lute.<sup>56</sup> “There was a persuasion in her touch as she laid her fingers ever so gently on your arm.”<sup>57</sup> Again like John, her geniality covered a hard core of sustained willpower. “She was full of mirth and cheer, yet . . . rather inclined to be grave and reserved,” Lute recalled.<sup>58</sup> A paragon of self-control, she never lost her temper and lacked the skittish frivolity of youth.

Early on, John and Laura must have spotted each other as kindred souls, especially when it came to religion. Cettie so unswervingly performed her duties at church and Sunday school that even her loving sister tactfully suggested that she went to extremes. “She was a *religieuse*. God and church came first with her. She cared little for the ‘social life,’ so called; and together she and her husband deepened and expanded their religion to cover and include every phase of life.”<sup>59</sup> Even in photos, one notes a Quakerish simplicity to her appearance, her black dress and lace collar evoking her Puritan ancestors. Despite her evangelical beliefs, she never imposed her views on others and preferred to instruct by example. As one high-school classmate remembered, “She exerted a strong influence upon the rest of us. For one thing she didn’t believe in dancing and theatregoing, because she did not think it was proper for church people to engage in pursuits that she considered worldly.”<sup>60</sup> For all that, Laura was no shallow philistine and had a wide range of interests in art, culture, and society. She played the piano for three hours daily and often accompanied John in duets, but she also had a taste for literature and poetry and could be an entertaining conversationalist.

An assiduous student, she was the valedictorian of her high-school class and her commencement speech, “I Can Paddle My Own Canoe,” was a ringing manifesto of female emancipation. (She graduated seven years after the first historic attempt by Elizabeth Cady Stanton and Lucretia Mott to

organize women in Seneca Falls, New York.) From this speech, we can infer something of her adolescent values. “We may not tamely submit, and suffer ourselves to be led by any person or party, but have a mind of our own, and having once formed a decision ever abide by it.”<sup>61</sup> This credo augured well for a woman destined to be embroiled in her future husband’s controversial career. In an outspoken statement of feminist belief, she chided men for depriving women of culture then hypocritically blaming them for their dependency. “But give woman culture—let her thread the many paths of science—allow mathematics and exact thought on all subjects to exert their influence on her mind and conventions need not trouble about her ‘proper sphere.’”<sup>62</sup>

In 1856, Harvey and Lucy Spelman left Cleveland for Burlington, Iowa; the move evidently reflected renewed business hardships for Mr. Spelman, and they stayed away from Cleveland for three years. To alleviate the financial stress, Cettie and Lute stayed behind and jointly applied for teaching posts in the Cleveland public schools. Two years later, as the economic pinch eased, the two sisters spent a year at the Oread Collegiate Institute in Worcester, Massachusetts. Established in 1849, this junior college was among the first institutions of higher learning open to women. Founded by abolitionist Eli Thayer, Oread stressed Christianity and the reading of the classics. Drawings show a picturesque, medieval-looking building on a hill, festooned with turrets, towers, and crenellations and surrounded by a stone wall. The cultural atmosphere, with its impassioned support for women’s rights and black welfare, must have been highly congenial to the sisters. Among other speakers, they heard inspirational lectures given by Ralph Waldo Emerson, Wendell Phillips, Henry Ward Beecher, and John Brown. A devotee of the Protestant work ethic, Cettie even approved of the school’s daily regimen, which was minutely budgeted from wake-up at 5:30 A.M. until the lights went out at 9:45 P.M. “I do not call the rules strict but am pleased with all of them,” she informed her former music teacher.<sup>63</sup> At Oread, she dropped an occasional friendly note to Rockefeller, though the relationship was at this point less one of romance than of close camaraderie.

Over the years, Laura’s growing commitment to religion smothered her literary bent, but at Oread she was a veritable bluestocking, writing poetry, running the literary society, and editing the campus literary magazine. In a revealing article in the *Oread Euphemia*, she wrote about three aristocracies then ruling America—an aristocracy of intellect in New England, wealth in the mid-Atlantic states, and blood in the South. In view of later events, her descriptions of Boston’s intellectual preeminence or southern social decadence are less noteworthy than the vitriol she poured on the New York nouveaux riches. “In this specified portion of our glorious republic, the ‘parvenu’ lady, with a brain all guiltless of ever having developed an idea, attires her self in habiliments, whose *cast* (but not *style*) would admit of their being worn in the presence of royalty.” After lambasting the dominion of the “almighty dollar” in the mid-Atlantic aristocracy, she concluded mordantly, “The gigantic intellect of Boston must bow to Wall St. Stocks and Bonds.”<sup>64</sup> Such midwestern scorn for Wall Street’s monied upstarts was certainly consonant with Rockefeller’s beliefs. Little did the two know they would one day become synonymous with the “almighty dollar” and reside in the heart of Manhattan’s swankest, most sinful precincts.

In the spring of 1859, the Spelman sisters returned to Cleveland and began to take French, Latin, piano, and voice lessons at the Cleveland Institute. That autumn, Cettie and Lute, who always moved in tandem, began to teach in the public schools, Cettie serving as a teacher and principal’s assistant while Lute taught boys in the same building. Later on, Laura left no doubt of her family’s straitened circumstances at the time. “I had to do [work], which was a good thing,” she later told her son, “and I loved to do it, which was another good thing.”<sup>65</sup> Despite a well-merited reputation as a disciplinarian, she was a popular teacher, and on her last day on the job “all the girls in her class remained after dismissal to say good-bye to her and to cry over losing her,” said one pupil. “My! how they cried.”<sup>66</sup>

In the early 1860s, Laura was sufficiently pleased with work that she felt in no special rush to get married. All the while, John Rockefeller, with the dogged patience that would defeat scores of embattled competitors, waited determinedly in the wings. In April 1860, Laura wrote her former music teacher, “I seem to have no anxiety about leading a life of single-blessedness,” but she mentioned Rockefeller and said that “a gentleman told me not long ago, that he was in no particular rush to have me get married, but he hoped that in the multitude of my thoughts I would not forget the subject.”<sup>67</sup> She must have been torn when contemplating a match with Rockefeller, for teachers had to remain single, and marriage would end her career.

In 1862, Rockefeller, buoyed by his rising wealth in the produce business, began to woo Cettie in earnest, often appearing at her school at day’s end to take her home. The Spelmans then lived in a lovely area of apple groves and greenery called The Heights, and on weekends John and brother William often rode out there under the guise of watching Civil War recruits drill nearby. After the Spelmans moved to a new home in downtown Cleveland, John, often wearing boots spattered with oil from his new refinery, stopped by and took Cettie out for drives in his buckboard, and she heard with delight the details of his business. “Her judgment was always better than mine,” Rockefeller said. “She was a woman of great sagacity. Without her keen advice, I would be a poor man.”<sup>68</sup> There was loving exaggeration here, but in the early days of their marriage, he did bring home the books and review them with her.

Despite her constant reluctance, Rockefeller pursued her with quiet persistence; in love as in business, he had a longer time frame, a more settled will, than other people. By early 1864, with the first profits rolling in from refining, he had become a substantial person in Cleveland, cutting an impressive figure in his frock coat, silk hat, and striped trousers. He was a handsome young man, with a fine, straight nose, rather humorless mouth, and vaguely mournful visage. His mustache flowed into fluffy side-whiskers, but his hair was already receding at the temples. His eyes were steady and lucid, as if confidently scanning the horizon for business opportunities.

Later on, Rockefeller was peculiarly reluctant to divulge to his children details of his courtship, referring to the delicacy of the situation. One gathers that another man, more practiced in the arts of love, was after Laura and that by March 1864 John feared his rival might best him. The time had come to force the situation. As one person who heard the story secondhand remembered, “John D. wanted to marry her, so he went to her one day and proposed in a business-like way, just like he would make a business proposition. She accepted him in the same business-like way.”<sup>69</sup> One imagines the two of them smiling shyly with relief. Shortly afterward, the ascetic Rockefeller did something wholly out of character, spending a shocking \$118 for a diamond engagement ring. The splurge, one suspects, had a point: He wished to telegraph to the Spelmans that he was no longer a callow country boy but a rising young businessman who could support them in a style to which they were accustomed.

After a discreet, six-month engagement, on September 8, 1864, hard on the heels of Sherman’s march into Atlanta, John D. Rockefeller, twenty-five, married Laura Celestia Spelman, twenty-four, in the living room of the Spelman home on Huron Street. It was a small, private affair attended only by the

two families. Like many things in Rockefeller's life, it was carried out in secrecy, and the Cleveland papers printed no notice of it—very odd given the Spelmans' prominence. It is unlikely that Big Bill attended, and John might have worried that his absence would spark curiosity about him. Having established his financial wherewithal, Rockefeller now reverted to type and spent just \$15.75 on the wedding ring, which was duly recorded in Ledger B under the rubric "Sundry Expenses."<sup>70</sup> In a denominational compromise, the pastors from Laura's Plymouth Congregational Church and John's Erie Street Baptist Mission Church jointly officiated, though Laura henceforth switched her allegiance to the Baptists.

Refusing to deviate from routine, John worked the morning of his wedding day, visiting both his downtown office and the cooperage at the refinery. He had arranged a special luncheon for twenty-six employees, without disclosing at first the reason for the celebration. When the jovial bridegroom left for the wedding, he told the foreman facetiously, "Treat them well, but see that they work."<sup>71</sup> With the Swiss precision that governed his life, Rockefeller allotted exactly one month—September 8 to October 8, 1864—for a honeymoon that traced a conventional itinerary. The newlyweds started off at Niagara Falls, followed by a stay at the Saint Lawrence Hall Hotel in Montreal and the Summit House in Mount Washington, New Hampshire. On the way home, they stopped off at Oread Collegiate Institute and met two new teachers, Sophia B. Packard and Harriet E. Giles, who would play important roles in their future.

Prior to his honeymoon, Rockefeller's travels had been limited, and the provincial young man in the tall silk hat exhibited voracious curiosity throughout the trip. While touring Niagara Falls, he peppered the guide with so many questions that the man grew distracted, ran the buggy into a ditch, and smashed a wheel. At another point, they met an old man in the roadway whom John so sedulously drained of local lore that the latter finally pleaded with weary resignation, "For God's sake if you will go with me over to that barn yonder, I will start and tell you everything I ever knew."<sup>72</sup> This was the same monotonously inquisitive young man who was known as "the Sponge" in the Oil Regions.

For the first six months of their marriage, John and Laura lived with Eliza at 33 Cheshire Street; then they moved into a dignified, two-story brick house at 29 Cheshire Street. Surrounded by a white picket fence, the house had tall, graceful windows but was disfigured by an ugly portico. Even though Rockefeller now operated and partially owned the largest refinery in Cleveland, he and Laura lived frugally without house servants. Rockefeller always cherished the chaste simplicity of this early period and preserved their first set of dishes, which stirred him to wistful reflections in later years. Thus, by the end of the Civil War, John D. Rockefeller had established the foundations of his personal and professional life and was set to capitalize on the extraordinary opportunities beckoning him in postwar America. From this point forward, there would be no zigzags or squandered energy, only a single-minded focus on objectives that would make him both the wonder and terror of American business.

## The Poetry of the Age

The period after the Civil War was the most fertile in American history for schemers and dreamers, sharp-elbowed men and fast-talking hucksters, charlatans and swindlers. A perfect mania for patents and inventions swept America, as everybody tinkered with some new contrivance. It was a time of bombastic rhetoric and outsize dreams. As always during a protracted war, millions of people postponed their lives until the ghastly bloodshed was over, then they turned to private life with newfound zeal. The sudden wealth of young businessmen such as Rockefeller fed envy among returning soldiers, who wished to emulate their good fortune. The money fever was, in part, the reaction to a war that had appealed to both the worst and the best in the national character, for Lincoln's high-minded crusade had often been debased by profiteering contractors operating behind patriotic façades. For many in the North, the high drama of preserving the union and emancipating the slaves had exhausted their capacity for altruism, leaving a residual contagion of greed.

As the banker Thomas Mellon observed of these years of unfettered growth,

*It was such a period as seldom occurs, and hardly ever more than once in anyone's lifetime. The period between 1863 and 1873 was one in which it was easy to grow rich. There was a steady increase in the value of property and commodities, and an active market all the time. One had only to buy anything and wait, to sell at a profit; sometimes, as in real estate for instance, at a very large profit in a short time.*<sup>1</sup>

A new cult of opportunity sprang up, producing a generation of business leaders for whom work was the greatest adventure life afforded. As Mark Twain and Charles Dudley Warner wrote in *The Gilded Age*, "To the young American . . . the paths to fortune are innumerable and all open; there is invitation in the air and success in all his wide horizon."<sup>2</sup> Or as one character in William Dean Howells's novel *The Rise of Silas Lapham* phrased it, "There's no doubt but money is to the fore now. It is the romance, the poetry of our age."<sup>3</sup> Self-made businessmen were the new demigods, and a copious self-help literature sermonized that young men who worked hard and saved could enter the millionaires' pantheon. This new industrial boom downgraded the power of the old gentry and rural elites, substituting a new species of self-made men: economic marauders too busy making money to be overly concerned with tradition. The era of the Great Barbecue—the felicitous name coined by literary historian Vernon Parrington—was dominated by arrogant, enterprising men in railroads, shipping, and stock manipulation: Jay Cooke, Commodore Vanderbilt, Jay Gould, Daniel Drew, Jim Fisk, and many others. The age was presided over by an inept president, General Ulysses S. Grant, a small-town businessman before the war, who was enamored of the rich, no matter how frequently they tried to fleece him.

The public was divided about these colossal developments. The appetite for gain fostered new fortunes and built up the industrial infrastructure, setting the stage for American industrial preeminence, but it also unsettled people with a sense of something frightening, gigantic, and poorly understood that was drastically transforming their innocent country. The Civil War invited people to repudiate their pasts as they staked out new lives. As Grant phrased it in his memoirs, "The war begot a spirit of independence and enterprise. The feeling now is, that a youth must cut loose from his old surroundings to enable him to get up in the world."<sup>4</sup> As people took unethical shortcuts to success, the universal race for riches threatened to overthrow existing moral systems and subvert the authority of church and state.

The triumph of the North meant the ascendancy of urbanization, immigration, industrial capitalism, and wage labor over an agrarian southern economy doomed to stagnate for decades. The war markedly accelerated the timetable of economic development, promoting the growth of factories, mills, and railroads. By stimulating technological innovation and standardized products, it ushered in a more regimented economy. The world of small farmers and businessmen began to fade, upstaged by a gargantuan new world of mass consumption and production. As railroad expansion gained momentum, populating the West and culminating in completion of the first transcontinental railroad in 1869, it spawned an accompanying mania in land deals, stock promotions, and mining developments. People rushed to exploit millions of acres of natural resources that could be economically brought to market for the first time.

In short, by the end of the Civil War, the preconditions existed for an industrial economy of spectacular new proportions. Before the war, the federal government had only twenty thousand employees and shied away from attempts to regulate business. Unlike Europe, America had no tradition of political absolutism or ecclesiastic privilege to quench entrepreneurial spirits, and the weak, fragmented political system gave businessmen room to flourish. At the same time, America had the legal and administrative apparatus necessary to support modern industry. There was respect for private property and contracts; people could get limited corporate charters or file for bankruptcy; and bank credit, while not yet plentiful, was everywhere available in a highly fragmented banking system. In time, the government redefined the rules of the capitalist game to tame trusts and preserve competition, but as John D. Rockefeller set about building his fortune, the absence of clear-cut rules probably aided, at first, the creative vigor of the new industrial economy.

Perhaps no industry so beguiled the Civil War veterans with promises of overnight wealth than the oil industry. In astonishing numbers, a ragtag group of demobilized soldiers, many still in uniform and carrying knapsacks and rifles, migrated to northwest Pennsylvania. The potential money to be made was irresistible, whether in drilling or in auxiliary services; people could charge two or three times as much as they dared to ask in the city. Ida Tarbell speculated that "this little corner of Pennsylvania absorbed a larger portion of men probably than any other spot in the United States. There were lieutenants and captains and majors—even generals—scattered all over the field."<sup>5</sup> They brought with them a military sense of organization and a bellicose competitive spirit, but they were eager for quick killings and betrayed little sense of how to fashion a stable, lasting business, providing an opening for the organization-minded Rockefeller.

The war had stimulated growth in the use of kerosene by cutting off the supply of southern turpentine, which had yielded a rival illuminant called camphene. The war had also disrupted the whaling industry and led to a doubling of whale-oil prices. Moving into the vacuum, kerosene emerged as an economic staple and was primed for a furious postwar boom. This burning fluid extended the day in cities and removed much of the lonely darkness

from rural life. The petroleum industry also furnished lubricants to grease the wheels of heavy industry. Though the world oil industry was squeezed into western Pennsylvania, the repercussions were felt everywhere. In 1865, Congressman James Garfield alluded to the oil craze in a letter to a former staff officer: "I have conversed on the general question of oil with a number of members who are in the business, for you know the fever has assailed Congress in no mild form. . . . Oil, not cotton, is King now, in the world of commerce."<sup>6</sup> Soon, John D. Rockefeller would reign as the undisputed king of that world.

In many ways, Rockefeller seemed a finely tuned instrument of the zeitgeist, the purest embodiment of the dynamic, acquisitive spirit of the postwar era. Like other Gilded Age moguls, he was shaped by his faith in economic progress, the beneficial application of science to industry, and America's destiny as an economic leader. He steeled himself to persevere, subordinating his every impulse to the profit motive, working to master unruly emotions and striving for an almost Buddhist detachment from his own appetites and passions. "I had a bad temper," Rockefeller said. "I think it might be called an ugly temper when too far provoked."<sup>7</sup> So he trained himself to control this temper and tried never to be guided by ego or pique.

By the end of the Civil War, the pale, trim twenty-six-year-old with the reddish gold hair and side-whiskers carried himself like a man of importance. No sooner had he formed a new firm with Sam Andrews than he was bent on expanding it. In December 1865, he and Andrews inaugurated a second refinery, the Standard Works, with brother William appointed its nominal head. The combined Excelsior and Standard Works confirmed Rockefeller as the leading Cleveland refiner at a time when the city ranked among the top refining centers. Photos of his first refineries show an unprepossessing cluster of buildings, scarcely bigger than sheds, spaced irregularly across a hillside. With hands clasped behind his back, Rockefeller paced these works, poking his head in everywhere, a perfectionist alert to the tiniest details. When he saw somebody attending to a neglected, unswept corner, he smiled and said, "That's right, eternal vigilance!"<sup>8</sup> For foreman, he recruited a man named Ambrose McGregor who was, in Rockefeller's description, "a precise, exacting man, honest as the day but perhaps not given to cultivating people."<sup>9</sup> An imposing, bewhiskered figure, McGregor won Rockefeller's absolute trust on all technical matters. Since the refineries stood some distance from downtown, Rockefeller and McGregor often lunched at the boardinghouse of a Mrs. Jones; the two men in their oil-soaked boots regularly offended the nostrils of other diners and were exiled to the porch.

As a self-made man in a new industry, Rockefeller wasn't stultified by precedent or tradition, which made it easier for him to innovate. He continued to value autonomy from outside suppliers. At first, he had paid small coopers up to \$2.50 for white oak barrels before he showed, in an early demonstration of economies of scale, that he could manufacture dry, tight casks more cheaply himself; soon his firm made thousands of blue-painted barrels daily for less than a dollar per barrel. Other Cleveland coopers bought and shipped green timber to their shops, whereas Rockefeller had the oak sawed in the woods then dried in kilns, reducing its weight and slicing transportation costs in half. And he continually extended the market for petroleum by-products, selling benzine, paraffin, and petroleum jelly in addition to kerosene.

In this early period, Rockefeller was a chronic worrier who labored under a great deal of self-imposed stress. Though not versed in the scientific side of refining, he often exercised a direct managerial role in the plant. With fluctuating market conditions, he sometimes needed to send shipments to New York with great dispatch and personally rushed down to the railroad tracks to motivate his freight handlers. "I shall never forget how hungry I was in those days. I stayed out of doors day and night; I ran up and down the tops of freight cars when necessary; I hurried up the boys."<sup>10</sup>

At the time, refiners were tormented by fears that the vapors might catch fire, sparking an uncontrollable conflagration. Fire had already taken many lives in the industry—Edwin Drake's well, for example, was destroyed by fire in the autumn of 1859. During the Civil War, there were so many spectacularly destructive blazes along Oil Creek that producers posted signs warning, "Smokers Will Be Shot."<sup>11</sup> Mark Hanna, who later managed President McKinley's campaign, recalled how one morning in 1867 he woke up and discovered that his Cleveland refinery had burned to the ground, wiping out his investment, and such fears kept refiners on tenterhooks around the clock. "I was always ready, night and day, for a fire alarm from the direction of our works," said Rockefeller. "Then proceeded a dark cloud of smoke from the area, and then we dashed madly to the scene of the action. So we kept ourselves like the firemen, with their horses and hose carts always ready for immediate action."<sup>12</sup>

Such was the perpetual fire menace posed by the new industry that refineries were soon banned within the Cleveland city limits, hastening the growth of Kingsbury Run. In those years, oil tanks weren't hemmed in earthen banks as they later were, so if a fire started it quickly engulfed all neighboring tanks in a flaming inferno. Before the automobile, nobody knew what to do with the light fraction of crude oil known as gasoline, and many refiners, under cover of dark, let this waste product run into the river. "We used to burn it for fuel in distilling the oil," said Rockefeller, "and thousands and hundreds of thousands of barrels of it floated down the creeks and rivers, and the ground was saturated with it, in the constant effort to get rid of it."<sup>13</sup> The noxious runoff made the Cuyahoga River so flammable that if steamboat captains shoveled glowing coals overboard, the water erupted in flames. Each time a black cloud billowed up in the sky, people assumed another refinery had exploded, and kerosene prices soared. At least in retrospect, Rockefeller sounded philosophic about this omnipresent danger. "In those days, when the fire bell rang, we would all go to the refinery and help put it out. When the fire was burning I would have my pencil out, making plans for the rebuilding of our works."<sup>14</sup>

Even the dread of fire paled beside recurrent worries that the Pennsylvania oil wells would dry up, with no substitute in sight. As Rockefeller noted, "It was here today and there tomorrow, and none of us knew with any certainty about the continuance of the supply, without which these investments were valueless."<sup>15</sup> Already by the late 1860s, stern prophecies were issued about the industry's impending demise. There were two types of oilmen: those who thought the sudden boom an insubstantial mirage and who cashed in their profits as soon as possible; and those, like Rockefeller, who saw petroleum as the basis of an enduring economic revolution. During the salutary nightly sermons he gave himself in bed, Rockefeller often meditated on the transience of earthly wealth, especially oil, and admonished himself, "You've got a fair fortune. You have a good property—now. But suppose the oil fields gave out!"<sup>16</sup> Yet the future of the oil business became an article of religious faith for him, as did the feeling that the Lord had blessed him and his enterprise. In late 1867, several days before Christmas, he just missed a train that ended up in a terrible wreck, killing many passengers, and Rockefeller at once wrote to Cettie, "I do (and did when I learned that the first train left) regard the thing as the *Providence* of God."<sup>17</sup>

Not yet the *bête noire* of oil producers, Rockefeller frequently donned his shabby oil suit and traveled to Franklin, Pennsylvania, where he kept an office that purchased oil, saving on the cost of middlemen. The oil fever was so infectious in the Oil Regions that these trips always silenced any

fugitive doubts he might have entertained about the industry's survival. As one traveler reported after visiting Oil Creek in 1866, "Men think of oil, talk of oil, dream of oil, the smell and taste of oil predominate in all they eat and drink."<sup>18</sup> These trips energized Rockefeller, who returned to Cleveland with renewed faith. As a friend recalled, "When he came back he would always have great tales to tell, and his eyes would snap as he would speak of his desires to succeed."<sup>19</sup>

In the 1860s, nobody knew if significant oil deposits existed outside the rugged terrain of northwest Pennsylvania, so the industry had immediately taken on global proportions. Within a year of Drake's discovery, his backers were marketing oil in London and Paris, and Europe emerged rapidly as the foremost market for American kerosene, importing hundreds of thousands of barrels yearly during the Civil War. Perhaps no other American industry had such an export outlook from its inception. By 1866, fully two-thirds of Cleveland kerosene was flowing overseas, most of it routed through New York, which became the export entrepôt for oil. At once, Rockefeller saw that he had to look beyond American shores to soak up excess production: "It seemed absolutely necessary to extend the market for oil by exporting to foreign countries, which required a large and most difficult development."<sup>20</sup> To accomplish this, he dispatched brother William to New York City in 1866 to launch the firm of Rockefeller and Company, which would oversee the exports of their Cleveland refineries.

If William wasn't much younger than John—"My brother is one year, one month and eight days younger than I am," John specified with comic exactitude—he certainly had a younger brother's deference and mentality.<sup>21</sup> Already settled by this time, William had gotten married in May 1864 to Almira ("Mira") Geraldine Goodsell, who came from a well-heeled Cleveland family with Yankee antecedents. The photos of William in his early twenties reveal a young man with thick muttonchop whiskers, clear eyes, and a broad, smooth forehead who looks more placid and less driven than his elder brother. Throughout their lives, despite their antithetical temperaments—William was bluff and friendly and freer than John in morals and manners—the brothers remained warm companions and close colleagues. William was a natural salesman who easily charmed people. Even in Pennsylvania, he was a popular figure who swapped tales with oil producers while John held himself aloof. "William always judges everything by intuition and instinct," said John, tacitly contrasting his brother with himself. "He doesn't act on analysis."<sup>22</sup> But those instincts were sound, and, while William took things seriously, he didn't puff them up into grand moral crusades the way his brother did.

As a novice businessman, William had been precocious like his brother. After joining John as a bookkeeper at Hewitt and Tuttle, he was spirited away by a local miller and ended up at a produce-commission house, making partner after just one year. By age twenty, he was already earning \$1,000 a year—"much more than I got," noted John wryly—and winning his older brother's confidence.<sup>23</sup> "My brother was a young, active and efficient, and successful, businessman."<sup>24</sup> The quality that most endeared William to John was sheer dependability. In later years, John repeated the anecdote of how his brother, as a young bookkeeper, awoke in the night and realized that he had made an error in a bill of lading. He was so disturbed that he couldn't wait till morning to correct it and marched down to the lakefront warehouse during the night so that the ship could sail on time with proper paperwork. In September 1865, William left the produce house of Hughes, Davis and Rockefeller to join his brother's oil-refining business, and, when the Standard Works was organized that December, it bore the name of William Rockefeller and Company.

Before long, John D. Rockefeller was cast by critics as the omnipotent wizard of the oil market, setting prices as the whim seized him, but by sending William to New York he acknowledged that the export market decisively influenced oil prices. Whenever news of a Pennsylvania gusher reached New York, the French and German buyers, anticipating lower prices, simply stopped buying, and this made them the ultimate arbiters of price. "They sat there like a lot of vultures," said Rockefeller. "They wouldn't buy until the price of refined had fallen very low on account of the flood of crude oil in the market."<sup>25</sup> One of William's tasks in New York was to apprise the firm's buyers in the Oil Regions of sudden drops in export prices so that they could temporarily curtail crude-oil purchases.

When William arrived in New York, he set up unadorned offices at 181 Pearl Street, and the proximity to Wall Street was critical. To implement their audacious schemes, the Rockefellers needed massive capital but encountered two problems that seemed insuperable. The elite Wall Street bankers preferred to finance railroads and government and regarded oil refining as a risky, untested business, nothing short of outright gambling. Mindful of the extreme fire hazards and the specter of the oil running dry, only a few intrepid souls dared to wager on it. At the same time, John D.'s insatiable need for money outstripped the meager resources of Cleveland banks, forcing him to widen his search to New York, where he could secure credit at more advantageous rates. "And my dear brother, William, being located in the metropolis, where the opportunities were better for securing money, had upon him this financial burden, and he showed marked ability in keeping a steady nerve and presenting our case very well to the bankers."<sup>26</sup> As a result of John's foresight in assigning him to New York, William's career became closely intertwined with that of Wall Street—to an uncomfortable extent, from John's later perspective.

As a gray eminence of the business world in his retirement, John D. betrayed a deep suspicion of financiers, boasted that he never borrowed, and was celebrated for his financial conservatism. Yet at this stage of his career, he turned inescapably to bankers. "One can hardly recognize how difficult it was to get capital for active business enterprises at that time," he admitted.<sup>27</sup> If Rockefeller ever came close to groveling, it was in his eternal appeals to bankers. "In the beginning we had to go to the banks—almost on our knees—to get money and credit."<sup>28</sup> When dealing with the banks, he vacillated between caution and daring: He often went to bed worrying how he would repay his large volume of loans, then awoke in the morning, refreshed by a night's sleep and determined to borrow even more.<sup>29</sup>

The Civil War introduced a new greenback currency and national banking system that generously stoked the postwar economy with credit. Many people grew rich with borrowed funds, creating a false flush of prosperity. Rockefeller was very much a product of this new credit-based society and owed a great deal to Truman Handy and other Cleveland bankers who identified him as a young businessman of exceptional promise. He cleverly projected the image of a rising star whom bankers spurned at their peril. One day, he ran into a banker, William Otis, who had allowed Rockefeller to borrow up to his credit limit; some directors were now expressing misgivings. Could Rockefeller stop by to discuss the loans? "I shall be very glad to demonstrate the strength of my credit at any time," replied Rockefeller. "Next week I shall need more money. I would like to give my business to your bank. Soon I shall have a great deal of money to invest."<sup>30</sup>

Obliging but never fawning, he knew how to soothe jittery creditors, and one of his cardinal rules was never to seem too eager to borrow. With amusement, he recalled how one day he was walking down the street, trying to figure out how to find an urgently needed \$15,000 loan, when a local banker pulled up in a buggy and serendipitously asked, “Do you think you could use \$50,000, Mr. Rockefeller?” Rockefeller, gifted with more than a touch of his father’s showmanship, studied the man’s face for a long time then drawled, “Well-I-I, can you give me twenty-four hours to think it over?” By stalling, Rockefeller believed, he pinned down the deal on the most favorable terms.<sup>31</sup>

Aside from his reputation for exemplary character, especially among Baptist business executives, Rockefeller had several other traits that inspired passionate allegiance from bankers. He was a stickler for the truth in presenting facts, never fudged or equivocated in discussing problems, and promptly repaid loans. At numerous points in his early career, he was rescued by bankers from crises that might have capsized his business. At one bank, the directors balked at extending him further credit after he suffered a refinery fire and hadn’t yet been compensated by insurers. Stepping into the breach, director Stillman Witt asked a clerk to fetch his own strongbox and announced with a flourish, “Here, gentlemen, these young men are all O.K., and if they want to borrow more money I want to see this bank advance it without hesitation, and if you want more security, here it is; take what you want.”<sup>32</sup>

It is impossible to comprehend Rockefeller’s breathtaking ascent without realizing that he always moved into battle backed by abundant cash. Whether riding out downturns or coasting on booms, he kept plentiful reserves and won many bidding contests simply because his war chest was deeper. Rockefeller vividly described the way that he had hastily enlisted the aid of bankers to snap up one refinery:

*It required many hundreds of thousands of dollars—and in cash; securities would not answer. I received the message at about noon, and had to get off on the 3 o’clock train. I drove from bank to bank, asking each president or cashier, whomever I could find first, to get ready for me all the funds he could possibly lay hands on. I told them I would be back to get the money later. I rounded up all of our banks in the city, and made a second journey to get the money, and kept going until I secured the necessary amount. With this I was off on the 3 o’clock train, and closed the transaction.*

<sup>33</sup>

To have orchestrated such a rapid campaign required a long relationship of trust with the banks.

So adroitly did Rockefeller manage his unending quest for money that he became a director of a fire-insurance company in 1866 and a director of the Ohio National Bank in 1868. By that point, he must have felt very sure of himself, even cocky, because he didn’t bother to attend bank meetings and was ejected posthaste from one board. One is again impressed by the fantastic forward motion of his career, how quickly he evolved from humble supplicant to impatient businessman. Now in his late twenties, he had little time for fuddy-duddy directors and often dispensed with the niceties. As he said of the bank’s board meetings: “I used to go at first, and there were some nice old gentlemen sitting stolidly about a table discussing earnestly the problem offered by new departures in vault locks. It was all right in its way, but I was a busy man even then and I really didn’t have the time for it. So they got rid of me speedily.”

For all his self-assurance, Rockefeller needed one associate who would share his daydreams, endorse his plans, and stiffen his resolve, and that indispensable alter ego was Henry Morrison Flagler. Nine years older than Rockefeller, with roguish good looks, Flagler was a dashing figure with luminous blue eyes, smooth black hair, and a handlebar mustache. “His clothes were of the most recent cut,” an office messenger said admiringly. “He carried himself with a confidence that was regal. He had a heavy black moustache and the most beautiful hair I had ever seen.”<sup>34</sup> Funny and voluble, brisk and energetic, Flagler was nevertheless reticent about his motives and background and in time surpassed his tight-lipped younger partner in fending off public inquiries.

Flagler’s upbringing had some noticeable parallels to Rockefeller’s. Born in Hopewell, New York, in 1830, the son of an impecunious Presbyterian pastor, he grew up in the Finger Lakes region of upstate New York before moving to Toledo, Ohio. In a previous marriage, his mother had been married to a Bellevue, Ohio, doctor named David Harkness, who already had a son, Stephen, from his first marriage. They had a second son, Dan, before David Harkness died. Flagler’s mother, Elizabeth, then married the Reverend Isaac Flagler. Evidently a man of courage and principle, Reverend Flagler created an uproar when he officiated over the marriage in Toledo of a young mulatto man to a white woman.

Dropping out of school at fourteen, Henry made his way to Republic, Ohio, and worked in the small country store of Lamon Harkness, Dr. Harkness’s younger brother. He later spun romantic tales of this first job, where he sold molasses and dry goods by day and slept in the drafty rear of the store at night. For special customers, Flagler would dip into a keg of brandy hidden upstairs. Becoming further entangled with his Harkness relatives, Henry married Lamon’s daughter, the dark-eyed, demure Mary, in 1853.

Before the Civil War, Henry earned good money in Lamon’s grain business in Bellevue, in the corn and wheat belt of Sandusky County, where he shipped much produce through Cleveland. “John D. Rockefeller was a commission merchant in Cleveland, and I sent him a good many carloads of wheat, which he sold as my agent,” he recalled.<sup>35</sup> In a lucrative sideline, Flagler and his Harkness relatives took an interest in a whiskey distillery, which also provided an outlet for surplus grain. Like Rockefeller, Flagler was a prudish young man who never swore an oath stronger than “Thunder!” As a teetotaler, Sunday-school teacher, and minister’s son, Flagler’s liquor venture didn’t square with his principles—though the profits evidently provided balm to his conscience. “I had scruples about the business and gave it up,” he confided, “but not before I made \$50,000 in Bellevue.”<sup>36</sup> Awash with cash, he built a stately Victorian mansion, the Gingerbread House, that was brightly illuminated with coal-oil lamps. Among the visitors was John D. Rockefeller, then canvassing accounts for his partnership with Maurice Clark. “He was a bright and active young fellow full of vim and push,” said Rockefeller, as if Flagler were the younger of the two.<sup>37</sup>

During the Civil War, Flagler, like Rockefeller, hired a substitute. His firm was a major contractor for grain purchases by the Union army and in 1862, brimful of wartime profits, he cast about for a fresh opportunity. At this point, Flagler stumbled into the sole business blunder of his career when he took a sizable stake in a salt company in Saginaw, Michigan, and moved his family there. When the war ended, slashing demand for salt, his firm went bankrupt, the victim of a classic boom-and-bust cycle. Losing everything, he had to be bailed out by a giant loan from the Harkness family. “At the end of three years, I had lost my little fortune and owed \$50,000 to about 50,000 Irishmen who had been working in the salt factory,” said Flagler.<sup>38</sup> He

had much occasion to ponder the contradictions of a market economy in which dynamic industries swiftly expand during prosperity only to find themselves overextended during downturns. To cope with excess production, many Saginaw salt companies opted for cooperation over competition and joined a cartel arrangement to try to prop up salt prices, providing a precedent for Standard Oil.

After his sobering reversal of fortune, Flagler entered a despondent period in which he sometimes skipped lunch to save money. Returning to Bellevue, he tried to market felt wool as well as a machine he had invented that would supposedly produce the perfect horseshoe. Deciding to try his luck in Cleveland (where Stephen V. Harkness had moved in 1866), he took a job selling grain with Rockefeller's ex-partner, Maurice Clark, and by coincidence filled the post recently vacated by Rockefeller. Perhaps to tweak Clark, Rockefeller invited Flagler to rent desk space in his office suite in the Sexton Block. As Flagler prospered, he settled his debts, bought a fine house on Euclid Avenue, and joined the First Presbyterian Church.

As they strolled to and from work together, Flagler and Rockefeller must have soon discovered their remarkable affinity as businessmen. Chafing at his dependence on loans and wondering when he might deplete the capital of local banks, Rockefeller now scouted out large individual investors and was probably acutely aware of the wealth of Flagler's relatives. Through Flagler's introduction, Rockefeller solicited money from Stephen V. Harkness, by now one of Cleveland's richest men. A bearish man with thick, slightly unkempt hair, fluffy sideburns, and a walrus mustache, Harkness had capitalized on inside political information to make a fortune during the war. As an ally of U.S. senator John Sherman of Ohio, he had received timely word in 1862 of an upcoming government move to levy a two-dollar tax on every gallon of malt and distilled liquor. Before the tax took effect, he busily stockpiled wine and whiskey and even raided the deposits of a local bank he owned to pour more money into this operation.<sup>39</sup> When the tax was enacted in July 1862, he sold his enormous cache of spirits for a fast \$300,000 profit. It is deeply ironic that Rockefeller, a staunch temperance advocate, got one of his most significant cash infusions from questionable gains in liquor.

While Rockefeller was negotiating a large loan from Stephen V. Harkness during an hour-long talk in 1867, the latter saw an excellent opportunity to set up Henry in business and instead of extending a loan asked for a large block of stock in the company. Investing \$100,000—a third of the new firm's capital—Harkness made it a precondition of his investment that Henry become treasurer and his personal deputy in the firm. As Harkness said to Rockefeller, "Young man, you can have all the money you want. You are on the right track and I am with you." As to Henry's part, he added, "I'll make Henry my watchdog."<sup>40</sup> Since Harkness was also a director of banks, railroads, mining, real estate, and manufacturing companies, the tie ushered Rockefeller into a new universe of business connections.

On March 4, 1867, the *Cleveland Leader* announced the formation of a new partnership, Rockefeller, Andrews and Flagler, with offices in the Case Building, a solid masonry structure with rounded, Romanesque windows and a prestigious address on the Public Square. "This firm is one of the oldest in the refining business and their trade already a mammoth one. . . . Their establishment is one of the largest in the United States. Among the many oil refining enterprises, this seems to be one of the most successful; its heavy capital and consummate management having kept it clear of the many shoals upon which oil refining . . . houses have so often [been] stranded."<sup>41</sup> From reading this description, one would have thought the firm was run by gray, reverend men, whereas Rockefeller, the boy wonder of Cleveland business, was just twenty-seven.

Starting with Flagler's recruitment, Rockefeller began to assemble the team of capable, congenial executives who would transform the Cleveland refiner into the world's strongest industrial company. Both Rockefeller and Flagler had nimble minds for numbers and infinite dexterity with balance sheets. Neither was interested in a modest success, and they were both prepared to go as far and as fast as the marketplace allowed. As Flagler boasted, "I have always been contented, but I have never been satisfied."<sup>42</sup> Rockefeller found his partner's enthusiasm a tonic, noting that Flagler "was always on the active side of every question, and to his wonderful energy is due much of the rapid progress of the company in the early days."<sup>43</sup> Given their exalted goals, it probably helped that Flagler had been chastened by failure and was acquainted with the perils of complacency.<sup>44</sup>

Rockefeller loved Flagler's dictum that a friendship founded on business was superior to a business founded on friendship, and for several decades they worked together in an almost seamless fashion. In the early years, the two men were bound by a common dream, lived near each other, and seemed virtually inseparable. As Rockefeller said in his memoirs, "We met and walked to the office together, walked home to luncheon, back again after luncheon, and home again at night. On these walks, when we were away from the office interruptions, we did our thinking, talking, and planning together." For a man as reserved as Rockefeller, this picture suggests an unbuttoned exchange of ideas of a sort he permitted with few people.

In the office, their intimacy was patent to visitors, for they had back-to-back desks and shared many duties. They even developed a collective letter-writing style, passing drafts back and forth with each making minor improvements until they expressed what was wanted but not one syllable more. At this point, the letters were ready to be vetted by the severest judge, Mrs. Rockefeller, who was, said one office worker, "known to be the most valued adviser."<sup>45</sup> Endowed with considerable verbal skill, Flagler had such a gift for drawing up legal documents or sniffing out hidden pitfalls in contracts that Rockefeller insisted he could have taught the fine points of contract law to lawyers—no small edge for a firm that would be engaged in running legal battles.

In his later years, Flagler developed into a grandee of such rich tastes that it is instructive to note his austere early style. Not only did he labor six days a week, but he shunned bars and theaters as the devil's playgrounds and became superintendent of the First Presbyterian Church. Like Rockefeller, he advocated self-discipline and deferred gratification. As he said of his first threadbare days in Cleveland: "I wore a thin overcoat and thought how comfortable I should be when I could afford a long, thick Ulster. I carried a lunch in my pocket until I was a rich man. I trained myself in the school of self-control and self-denial. It was hard on [me], but I would rather be my own tyrant than have some one else tyrannize me."<sup>46</sup> After his wife, Mary, gave birth to a son, Henry Harkness Flagler, in 1870, she never regained her health and turned into an invalid. For the next seventeen years, Flagler stayed home at night so he could read to her for hours on end, with John and Laura Rockefeller often stopping by to mitigate the gloom.

That Flagler was his most valuable partner was always unquestioned dogma for Rockefeller, yet one wonders whether the influence was altogether benign. An ebullient man, Flagler wouldn't stop to quibble over legal niceties when taken by a powerful idea, and even Rockefeller hinted obliquely at the dangers posed by Flagler's headstrong nature. "He was a man of great force and determination," said Rockefeller, "though perhaps he needed a restraining influence at times when his enthusiasm was roused."<sup>47</sup> On his desk, Flagler kept a quote from a popular novel, *David Harum*, which said,

“Do unto others as they would do unto you—and do it first.”<sup>48</sup> What makes Flagler’s ethics consequential for Rockefeller’s career was that he was the mastermind of many negotiations with the railroads—the single most controversial aspect of Standard Oil history. It’s not clear that anyone could have tempered the fiercely irrepressible drive of John D. Rockefeller, but the swashbuckling Flagler had especially little interest in transposing the lessons of his Sunday-school classes to the profane, turbulent world of oil refining. As far as Rockefeller was concerned, however, Flagler’s arrival was providential, for the oil industry was about to be thrown into unprecedented turmoil, making relations with the railroads all-important.

Transportation assumed a pivotal place in the petroleum business for an elementary reason: Drake had discovered oil in a distant, inaccessible spot that was, at first, poorly served by the railroads. For several years, teamsters—the wagoners who hauled out the barrels—exercised a brutal tyranny and charged exorbitant sums. Since oil was a relatively cheap, standardized commodity, transportation costs inevitably figured as a critical factor in the competitive struggle. The logical and elegant solution—to construct a comprehensive pipeline network—encountered harsh resistance from the threatened teamsters. During the 1865 Pithole frenzy, Samuel Van Syckel laid a two-inch iron pipeline from Oil Creek to railroad tracks six miles away. Defying armed guards, roaming gangs of teamsters descended each night and tore up sections of the pipeline. When Henry Harley launched a second pipeline, they again dug up pipes and set storage tanks ablaze, forcing Harley to field a small army of Pinkerton detectives to squash the revolt. The teamsters must have known they were fighting a rearguard action, but for a time they managed to delay the installation of a pipeline system.

Between the benighted rule of the teamsters and the future domination by efficient pipelines, there arose an interregnum in which the railroads exercised pervasive influence over everything that happened in the industry. At first, they tried to ship barrels on open flatcars, but the swaying, jolting ride splintered the containers and spilled their contents. After the Civil War, this hazardous method was superseded by primitive tank cars—twin pine tubs mounted on flatcars—that were soon replaced, in turn, by single iron tanks that became the industry norm. Such technical advances allowed the railroads to speed oil across the continent and vastly expanded the market for petroleum products.

During the first few years, the oil business was so effortlessly profitable that refineries sprang up in six competing centers. The inland centers (the Oil Regions, Pittsburgh, and Cleveland) and the seaboard centers (New York, Philadelphia, and Baltimore) engaged in pitched battles to control the business. Favored by proximity to the wells, the western Pennsylvania refiners seemed to possess an incalculable edge, but they had to import chemicals, barrels, machinery, and labor and therefore labored under distinct handicaps. Nonetheless, these refiners saved so much on transportation that they fancied they would emerge supreme in the oil business. Later, Rockefeller admitted that he’d been tempted to switch operations to Pennsylvania, yet he and his partners didn’t wish to uproot their families or write off their considerable investment in Cleveland. They also feared that the glory of the Oil Regions might soon fade into history, as Rockefeller later noted in a statement reminiscent of Percy Bysshe Shelley’s poem “Ozymandias”:

*You have seen Pithole and Petroleum Center—the places where once stood big, prosperous cities in which men made millions of dollars out of oil. Now they are bits of wilderness, overgrown with weeds, and with nothing left to tell of their greatness but a few scattered parts of old houses and the memory of a few aged men. Prudent men did not want to place all their capital into business in such places.*<sup>49</sup>

Even late in life, Rockefeller was loath to confess, for political reasons, the overriding reason for his attachment to Cleveland: It was the hub of so many transportation networks that he had tremendous room to maneuver in freight negotiations. During the summer months, he could send oil by water, greatly enhancing his bargaining power with the railroads. His firm “could load their oil in the season of lake navigation and canal navigation, upon vessels at Cleveland and from Buffalo by the Erie Canal [and] could deliver the oil to their warehouses in New York at a cost lower than the current rates at which the railway companies had been seeking the business.”<sup>50</sup> Armed with this potent weapon, Rockefeller obtained such excellent railroad rates that it compensated for having to ship the crude oil to Cleveland before sending refined oil to the Atlantic coast—a far more circuitous route than shipping from Titusville straight to New York. Fed by rail links to Chicago, Saint Louis, and Cincinnati, Cleveland also served as a natural gateway to western markets. Other Cleveland refiners evidently made the same calculation, and by late 1866 the city supported fifty refineries, ranking second only to Pittsburgh. Cleveland’s refineries were so numerous that their foul, acrid atmosphere enveloped the outskirts, tainting the beer from local breweries and souring the milk.

Besides access to the Erie Canal and Lake Erie, Cleveland was serviced by three main railroad lines that gave its inland refineries direct access to eastern ports: the New York Central, which ran north from New York City to Albany and then west to Buffalo, where its Lake Shore line ran along Lake Erie to Cleveland; the Erie Railroad, which also sped across New York State to a point south of Buffalo, where its Atlantic and Great Western subsidiary headed down into Cleveland and the Oil Regions; and the august Pennsylvania Railroad, which went from New York and Philadelphia to Harrisburg and Pittsburgh. With virtuosic brilliance, Rockefeller and Flagler played these three railroads against each other in seemingly endless permutations. They even managed to manipulate such redoubtable figures as the notorious Jay Gould, who had wrested the Erie Railroad from Commodore Vanderbilt in 1868. Flagler singled out Gould as the fairest and squarest of the railroad chieftains in his dealings, and Rockefeller, when asked to name the greatest businessman he had ever met, instantly cited Gould.<sup>51</sup> Gould himself later asserted that John D. Rockefeller had possessed “the highest genius for constructive organization” in American economic history.<sup>52</sup>

Before long, the various oil-refining centers were rushing to form tactical alliances with these railroad networks. As a natural outgrowth of their route structure, the New York Central and the Erie wanted to promote Cleveland as a refining center and regarded Rockefeller as a critical ally in efforts to boost their oil-freight business. With easy access to the oil fields via the Allegheny River, Pittsburgh might have seemed the optimal location, but its refiners were always held hostage to the freight monopoly of the Pennsylvania Railroad. Following a myopic and ultimately destructive policy toward Pittsburgh, the Pennsylvania Railroad decided it was more profitable to carry crude oil from Oil Creek all the way to Philadelphia or New York refineries rather than to have it refined in Pittsburgh. By penalizing Pittsburgh refiners with crushing rates, the railroad fattened its short-term profits but sacrificed the city’s future as a refining center and paved the way for the hegemony of the city the Pennsylvania wanted most to eradicate: Cleveland. As Rockefeller later said, the Pennsylvania Railroad’s attitude made it easy for him to find common cause with its archrivals, and he forged a cabal with the New York Central and the Erie that the Pennsylvania was hard-pressed to stop.

By the late 1860s, the press was rife with reports that the Pennsylvania Railroad had decreed that Cleveland would be “wiped out as a refining center

as with a sponge”—a statement forever engraved on Rockefeller’s unforgiving memory. Taking this as a declaration of war, he was emboldened to respond with the most robust countermeasures at his command. He was a man who always acted on Flagler’s business motto of favoring “sharp, vigorous and decisive measures.”<sup>53</sup> The Pennsylvania statement set off a panic-stricken reaction in Cleveland as local refiners prepared to transfer their operations to Oil Creek. Coolheaded in the face of such hysteria, Rockefeller saw that he could convert this chaos to advantage. By threatening to strip the others of their oil traffic, the Pennsylvania had placed the Erie and New York Central in a vulnerable position, and Rockefeller and Flagler decided to use this leverage to wring extreme concessions from them.

In the spring of 1868, Jay Gould hatched a secret deal with Rockefeller and Flagler that gave them shares in a subsidiary company called the Allegheny Transportation Company, which was the first major pipeline network serving Oil Creek. Through this deal, the Cleveland refiners received a staggering 75 percent rebate on oil shipped through the Erie system. As part of this extraordinary bonanza, Flagler also cut a deal with the Atlantic and Great Western, an Erie subsidiary, that gave Rockefeller, Andrews and Flagler highly advantageous rates on rail shipments between Cleveland and the Oil Regions.

In this season of bountiful concessions, Flagler also approached General J. H. Devereux, the newly installed vice president of the Lake Shore Railroad, which formed part of the New York Central system. Trained as a civil engineer, Devereux had revamped the railroad system in northern Virginia to assist the Union army and was commended by Lincoln for his work. In negotiating a new framework with him, Rockefeller and Flagler argued for preferential rates that would more than match discounts extended by the Pennsylvania Railroad to its customers in the Oil Regions. In other words, the young Cleveland refiners cannily converted their geographic disadvantage into a powerful bargaining tool and secured covert rates that allowed them to ship crude oil to Cleveland and then refined oil to New York for only \$1.65 per barrel compared to an officially listed rate of \$2.40.

In exchange for this extraordinary concession, Rockefeller and Flagler didn’t simply try to squeeze the railroads—they were much too shrewd and subtle for that—but offered compelling incentives. For instance, they agreed to assume legal liability for fire or other accidents and stop using water transport during the summer months. The biggest plum they dangled before Devereux was a promise to supply the Lake Shore with an astonishing sixty carloads of refined oil daily. Since Rockefeller lacked the refining capacity to fulfill this ambitious pledge, he was evidently prepared to coordinate shipments with other Cleveland refiners. For any railroad, the prospect of steady shipments was irresistible, for they could dispatch trains composed solely of oil-tank cars instead of a motley assortment of freight cars picking up different products at different places. By consolidating many small shippers into one big shipper making regular, uniform shipments in massive quantities, the railroads could reduce the average round-trip time of their trains to New York from thirty days to ten and operate a fleet of 600 cars instead of 1,800.

Never shy about his accomplishments, Rockefeller knew that he had broached a revolutionary deal: “It was a large, regular volume of business, such as had not hitherto been given to the roads in question.”<sup>54</sup> From that moment, the railroads acquired a vested interest in the creation of a gigantic oil monopoly that would lower their costs, boost their profits, and generally simplify their lives. As in other industries, the railroads developed a stake in the growth of big businesses whose economies of scale permitted them to operate more efficiently—an ominous fact for small, struggling refiners who were gradually weeded out in the savage competitive strife.

Without doubt, the Lake Shore deal marked a turning point for Rockefeller, the oil industry, and the entire American economy. Decades later, Ida Tarbell condemned it as Rockefeller’s original sin from which all others sprang. “Mr. Rockefeller certainly saw by 1868 that he had no *legitimate* superiority over those competing with him in Cleveland which would ever enable him to be anything more than one of the big men in his line.”<sup>55</sup> Only Rockefeller’s willingness to cheat and cut corners, Tarbell contended, had enabled him to outdistance the pack. This claim, echoed by Rockefeller’s most virulent critics, overstates the case, for even before Rockefeller accepted his first rebate, he was the world’s largest refiner, equal in size to the next three largest Cleveland refineries combined. In fact, it was the unparalleled scope of his operation that had enabled him to cut this exceptional deal in the first place. Tarbell perceived correctly, however, that the principal advantage of Rockefeller’s commanding position was that it meant special power to compel railroad-freight concessions.

In closing their historic deal, Rockefeller and Flagler suffered no twinges of conscience and were frankly elated by their triumph. “I remember when the Standard received its first rebate,” said Flagler. “I went home in great delight. I had won a great victory, I thought.”<sup>56</sup> But they knew they had dabbled in a dark and controversial practice, for the rebates were predicated on great secrecy. Many years later, Rockefeller explained to one railroad negotiator that their dealings with the Lake Shore rested on oral agreements that were never committed to paper. “Our people do not think it would be best for the Lake Shore Road, or us, to have a contract, but with the good faith between us and desire to promote each other’s interest, we can serve each other better by being able to say we have no contracts.”<sup>57</sup> Because many railroad deals ended with a handshake, not a signature, Rockefeller could breezily deny their existence without fear of embarrassing refutations later on.

As the chief transportation deal maker, Flagler had overseen the landmark pact, and Rockefeller always credited him for it. Some of this derived from Rockefeller’s humility, but it also betrayed a lifelong habit of covering his tracks and pretending to be elsewhere when critical decisions were made. Although Rockefeller didn’t lead the Lake Shore negotiations, he was smack in the thick of them. On August 19, 1868, he sent a fascinating letter to Cettie from New York that shows his toughness vis-à-vis the Vanderbilts, who controlled the New York Central, the Lake Shore’s parent. “We were sent for by Mr. Vanderbilt yesterday, at twelve o’c & did not go, he is anxious to get our business and said that he could meet us on the terms. We sent our card by the messenger, that Vanderbilt might know where to find our office later.”<sup>58</sup> The point is worth underscoring: Twenty-nine-year-old John D. Rockefeller demanded that seventy-four-year-old Commodore Vanderbilt, the emperor of the railroad world, *come to him*. This refusal to truckle, bend, or bow to others, this insistence on dealing with other people on his own terms, time, and turf, distinguished Rockefeller throughout his career.

Bolstered by the Lake Shore deal, Cleveland soon surpassed Pittsburgh as the leading refining center, and for the first time journalists began to track Rockefeller’s ascendancy. In 1869, one writer marveled at the power that this laconic young man, in his understated manner, had already attained in Cleveland. “He occupies a position in our business circles second to but few. Close application to one kind of business, an avoidance of all positions of honorary character that cost time, keeping everything pertaining to his business in so methodical a manner that he knows every night how he stands with the world.”<sup>59</sup>

Today an arcane, forgotten subject, the issue of railroad rebates generated heated debate in post-Civil War America since they directly affected the shape of the economy and the distribution of wealth. Railroads had obtained the power to produce either a concentrated economy, with progressively larger business units, or to perpetuate the small-scale economy of antebellum America. The proliferation of rebates hastened the shift toward an integrated national economy, top-heavy with giant companies enjoying preferential freight rates.

Rockefeller justly argued that he hadn't invented the rebate and that the Pennsylvania Railroad had granted thousands of them in the six years before his seminal Lake Shore deal. "It was a common practice in all descriptions of freighting, not peculiar to oil; in merchandise, grain, everything."<sup>60</sup> Rebates had inevitably accompanied railroad expansion. As the total railroad trackage doubled to 70,000 miles within eight years after the Civil War, the roads were saddled with high fixed costs and heavy bonded debt. This forced them to maintain a high, steady freight volume to stay alive and waylaid them into vicious rate wars. Rebates weren't just solicited by shippers but were sedulously pushed by railway freight agents eager to win over new business. Rebates enabled them to maintain the fiction of listed rates while secretly giving discounts to favored shippers. Over time, relations grew ever closer and more incestuous between the railroads and large shippers. For decades, Rockefeller and his colleagues enjoyed free passes on all major railroads, which they regarded not as payoffs but as natural perquisites of their business.

Rockefeller never saw rebates as criminal or illegitimate or as favors secured only by bullying monopolies. He was correct in stating that listed rates were always a farce, a starting point for haggling. Many refiners received rebates, not just the leading firms, and some tiny rivals actually got superior discounts, especially from the Pennsylvania Railroad. Rockefeller's business papers display much internal grumbling about this presumed inequity, for which he and his colleagues regularly chastised railroad officials at critical moments in negotiations. But in spite of numerous scattered cases of rival refiners getting comparable rebates, no other firm received so many rebates so consistently over so many years or on such a colossal scale as Rockefeller's. It was therefore disingenuous of him to suggest that rebates played only an incidental role in his success.

So were Ida Tarbell and other detractors justified in tarring Rockefeller's whole career based on railroad rebates? Unfortunately, the controversy was played out in a gray area of ethics and the law that makes a definitive answer impossible. From a strictly economic standpoint, Rockefeller rested on solid ground when he insisted that bulk shippers deserved a discount. "Who can buy beef the cheapest—the housewife for her family, the steward for a club or hotel, or the commissary for an army? Who is entitled to better rebates from a railroad, those who give it 5000 barrels a day, or those who give 500 barrels—or 50 barrels?"<sup>61</sup> Besides providing a steady flow of oil shipments, Rockefeller's firm invested heavily in warehouses, terminals, loading platforms, and other railroad facilities so that the roads probably derived more profit from his shipments than from those of rivals who paid higher rates. Small, irregular shippers were the bane of railroads for the simple, mechanical reason that they forced the trains to stop repeatedly to pick up single carloads of oil. To meet the terms of his deal with the Lake Shore, Rockefeller had to run his refineries at full capacity even when kerosene demand slackened. He therefore paid a price for his rebates and felt that equal rates for all shippers would have unfairly penalized his firm.

Perhaps because Ida Tarbell trained a glaring spotlight on the rebate issue, Rockefeller insisted vehemently in later interviews that the real profitability of his firm lay elsewhere. In an intriguing aside in later years, he even hinted that the clamor over rebates conveniently deflected public attention away from other, more profitable aspects of his operation: "Along this line much was said about rebates and drawbacks for long years, and the Standard Oil Company knew full well that the public were not on the right scent. They knew where their profits came from, but they did not deem it wise to inform the public, and especially their competitors, of the real secret sources of their strength."<sup>62</sup> Indeed, one can argue that the obsession among reformers with the rebate issue might have blinded them to a multitude of other sins.

Not until the Interstate Commerce Act in 1887 did it become an illegal, punishable offense for railroads to give rebates, and the practice didn't cease entirely until the 1903 Elkins Act. Nevertheless, by the end of the Civil War, a widespread belief had begun to take hold that railroads were common carriers and should shun favoritism. Ida Tarbell cited provisions in the Pennsylvania state constitution that, as she interpreted them, compelled railroads to serve as common carriers and avoid discrimination. Yet in the last analysis, she based her withering critique of Rockefeller less on specific laws than on her belief that he had violated a sense of fair play. "That is," she wrote in *McClure's Magazine* in July 1905, "rebate giving then as now, was regarded as one of those lower business practices which characterizes commerce at all periods, and against which men of honor struggle, and of which men of greed take advantage."<sup>63</sup> In the privacy of his study in 1917, an unrepentant Rockefeller disputed her view of the prevailing business ethics. "I deny that it was regarded as a dishonorable practice for a merchant or manufacturer to obtain the best rates possible for his goods."<sup>64</sup> As to Tarbell's charge that the secrecy of rebates proved their immorality, Rockefeller countered that railroads didn't wish to advertise discounts that might then be demanded by other shippers. "For these arrangements were not except by the academic expected to be published, any more than the general of an army's plans are published to enable the enemy to defeat him."<sup>65</sup>

The most compelling argument against rebates was that railroads received state charters and therefore had the right of eminent domain—that is, the right to claim private property in order to lay down tracks—investing their activities with a public character. In 1867, a committee of the Ohio senate declared that railroads, as common carriers, should charge equal rates, but a bill incorporating these ideas was defeated. The following year, just as Rockefeller implemented his Lake Shore deal, a Pennsylvania senate committee reported that railroads were common carriers and had "no right to show partiality among their customers"; but, again, no regulatory changes ensued.<sup>66</sup> Almost twenty years passed before reformers succeeded in introducing public regulation that forced an end to the railroad favoritism that so incensed farmers and other small shippers across America. In the meantime, Rockefeller profited enormously from the failure of public authorities to rectify the inequities of the transportation system, and his firm understandably kept up vigorous lobbying efforts to perpetuate the status quo.

## Millionaires' Row

Rockefeller had speedily acquired a level of respectability that would have seemed unthinkable fifteen years before when he and his demoralized family were crowded into the Humiston house in Strongsville. In August 1868, after his rebate deal with the Lake Shore Railroad, he certified his enhanced status in Cleveland when he and Cettie moved from Cheshire Street to a solid brick home at 424 Euclid Avenue. This move dramatized the immense distance he had traveled after a few years in the oil business. Local boosters had already tagged Euclid Avenue “the most beautiful street in the world,” with homes that lavishly mirrored the local fortunes in oil, iron, banking, timber, railroads, and real estate. All of the town’s new opulence was reflected in this street of massive houses. The residential address for such local luminaries as Henry B. Payne, Amasa Stone, and John Hay, Euclid Avenue claimed so many mansions that it had richly earned its sobriquet of “millionaires’ row.”

With the spacious grandeur of a fine Victorian street, always busy with fashionable horses and carriages, the wide avenue had a double row of elms that created a tall, shady canopy overhead. The imposing homes were deeply recessed from the street, their trimmed lawns and shapely shrubbery providing buffer zones between the houses and their distant front gates. Since few houses were separated from adjoining houses by fences, the street sometimes gave the impression of being a single, flowing park, with elegant homes standing in an unbroken expanse of greenery.

While Rockefeller’s home looked small and cramped beside Amasa Stone’s towering manse and other gaudy monstrosities, it was a substantial two-story structure with a mansard roof, a portico, and arched windows, shielded from the street by an iron picket fence that spanned its entire 116-foot frontage. Rockefeller could have afforded something showier than this \$40,000 house, and pedestrians might have thought its owner a lesser light in business, yet this was exactly the misimpression that he wanted to convey. Far from trying to parade his wealth, he wanted to blend into the scenery. Even at home, Rockefeller was discreet and behaved as if he was concealing some secret from prying eyes. Beyond that, he had the Puritan’s discomfort with possessions, a nagging Baptist anxiety that decoration might appear idolatrous. Again, like Weber’s ideal capitalist, “he avoids ostentation and unnecessary expenditure, as well as conscious enjoyment of his power, and is embarrassed by the outward signs of the social recognition which he receives.”<sup>1</sup>

Fond of roomy, ungainly houses that he could remodel ceaselessly, Rockefeller would have been stymied by a house that required no improvement. Utilitarian by nature, he was more concerned with the grounds and interiors of homes than with the subtleties of architectural ornamentation. “I hate frills,” he once said. “Useful things, beautiful things, are admirable; but frills, affectations, mere pretences of being something very fine, bore me very much.”<sup>2</sup> With a country boy’s love of open spaces, he hated anything confined or cluttered and probably chose the Euclid Avenue house for its large, high-ceilinged rooms, which included a parlor, a sitting room, and a dining room downstairs plus four bedrooms upstairs.

Rockefeller devoted more time and expense to the trees and shrubbery than to the house itself. To expand his gardens, he bought an adjoining lot but was disturbed by the house that came with it and obstructed his view. Since he detested waste, he donated the house to a new girls’ school being built a block away. In what was hailed as an engineering wonder at the time, the brick house was jacked up by a windlass and rolled down the block on greased logs—a spectacle that was covered by local papers and drew spectators. “Mr. Rockefeller . . . set [the house] on new foundations where it was as good as ever,” Lucy Spelman said of her brother-in-law’s feat. “This was a marvelous undertaking, but then he was always undertaking marvelous things.”<sup>3</sup>

Behind the house, he built a stone stable and coach house more magnificent than the residence itself. Over one hundred feet long, it had stout beams, pine panels, and elaborate chandeliers. An expert driver with either a pair of horses or a four-in-hand, Rockefeller had a passion for trotters, and Euclid Avenue provided a perfect straightaway for races. If anybody tried to pass him, the hypercompetitive Rockefeller automatically turned it into a trial of speed. John, William, and Frank were stockholders in a racing club called the Cleveland Driving Park Company, the first amateur club of its sort in America. Unable to do anything in a casual manner, Rockefeller became obsessive about his hobbies, which he could sometimes indulge in extravagant fashion. In the 1870s, his records show, he paid stupendous sums—from \$10,000 to \$12,500—for thoroughbred trotters with such evocative names as Midnight, Flash, Jesse, Baron, and Trifle.

In his early days in business, Rockefeller often suffered from severe neck pains that might have indicated stress on the job, and he turned to horses as a therapeutic diversion. “I would leave my office in the afternoon and drive a pair of fast horses as hard as they could go: trot, break, gallop—everything.”<sup>4</sup> Since Cettie was also fond of horses, they often rode together. His style of racing was also revealing: He never applied cruel, coercive measures to recalcitrant horses but studied them closely and tried to coax them along gently and with great patience. “I remember when my brother William and I used to go riding,” he said. “I would invariably come in first. He would be covered with perspiration, as was his horse. My horse would be too—but I would be as cool as I am now. I always would talk to my horses—quietly, steadily—never get excited.”<sup>5</sup> This unflappable style and conservation of energy also characterized his approach to the management of his vast oil empire.

Unlike his philandering father, John D. Rockefeller remained firmly, almost prudishly, anchored in domestic life. Much like Jay Gould—who didn’t drink, smoke, or gallivant with women—Rockefeller’s harsh business tactics were counterbalanced by exemplary behavior at home where he was a sweet, respectful Victorian husband. To borrow a line from Flaubert, to be fiercely revolutionary in business, he needed to be utterly conventional at home. Eternally at war with the devil, John and Cettie allowed their religious beliefs to define their entire cultural agenda. They subscribed to seats at the philharmonic, for instance, but theater and opera were too racy for these professing Christians. Shying away from social situations that weren’t safely predictable, they socialized only within a small circle of family members, business associates, and church friends and never went to clubs or dinner parties. “Club life did not appeal to me,” said Rockefeller. “I was meeting all the people I needed to meet in my day’s work. . . . My family would rather have me at home—even if I were snoring in an easy chair—than going out for the evening, and certainly I preferred to stay at home.”<sup>6</sup> He especially enjoyed the company of ministers whose genial, homiletic style matched his own. Thus walled off from temptation, Rockefeller was virtually untouched by the decadence of the Gilded Age.

Much of Rockefeller's preference for home life stemmed from his strict temperance views. Even late in life, he accepted an invitation to a hotel barbecue, then went to investigate the site beforehand. When he spotted empty beer bottles on the premises, he promptly withdrew his acceptance. Since he and Cettie were deeply involved in temperance work—they did everything from sponsoring lecture tours to lobbying to have temperance principles inserted in school textbooks—they avoided the very presence of liquor, and this severely cramped their social activities. Yet within their circumscribed world, they had a happy home life.

Rockefeller bridled at the notion that he was a business-obsessed drudge, a slave to the office. "I know of nothing more despicable and pathetic than a man who devotes all the waking hours of the day to making money for money's sake," he recorded in his memoirs.<sup>7</sup> He worked at a more leisurely pace than many other executives, napping daily after lunch and often dozing in a lounge chair after dinner. To explain his extraordinary longevity, he later said, doubtless overstating the matter, "I'm here because I shirked: did less work, lived more in the open air, enjoyed the open air, sunshine and exercise."<sup>8</sup> By his mid-thirties, he had installed a telegraph wire between home and office so that he could spend three or four afternoons each week at home, planting trees, gardening, and enjoying the sunshine. Rockefeller didn't do this in a purely recreational spirit but mingled work and rest to pace himself and improve his productivity. In time, he became something of an evangelist on health-related issues. "It is remarkable how much we all could do if we avoid hustling, and go along at an even pace and keep from attempting too much."<sup>9</sup>

There was a clockwork regularity about Rockefeller's life that made it seem mechanical to outsiders but that he found soothing. He didn't seem to require time to indulge normal human idleness, much less illicit passion. In his rigidly compartmentalized life, each hour was tightly budgeted, whether for business, religion, family, or exercise. Perhaps these daily rituals helped him to deal with underlying tensions that might otherwise have become ungovernable, for although he tried to project an air of unhurried calm, he was under terrific strain in creating his oil empire. He fretted endlessly about his company and, below the surface, was constantly on edge. In one of his few admissions of weakness, he recalled that "for years on end I never had a solid night's sleep, worrying about how it was to come out. . . . I tossed about in bed night after night worrying over the outcome. . . . All the fortune that I have made has not served to compensate for the anxiety of that period."<sup>10</sup>

By the time they moved to Euclid Avenue, the Rockefellers already had one child, Elizabeth (always called Bessie), who was born in the Cheshire Street house in 1866. (When Cettie was confined during childbirth and couldn't attend church, John jotted down notes on the sermon and read them back to her afterward.) All of the remaining children were born in an upstairs bedroom at Euclid Avenue. Their second child, Alice, was born in July 1869 but died a year later; then came Alta (1871), Edith (1872), and John Jr. (1874). They were delivered by a pioneering physician, Dr. Myra Herrick, Cleveland's first woman doctor, who organized a short-lived homeopathic college to train women in the field. When she set up a free medical dispensary, staffed exclusively by female doctors, to assist low-income women, Cettie and Mary Flagler were prominent contributors.

A surprisingly flexible, egalitarian father, Rockefeller never shrank from child care. His sister-in-law, Lute, who gave up teaching and went to live with them, told how John eased the burden from Cettie's shoulders when he was at home: "He would get up from his nap the moment he heard a baby cry and carry the little one up and down the room until she was quieted."<sup>11</sup> Rockefeller was always patient with his children and seldom lost his temper or uttered a harsh word. As the son of a self-absorbed absentee father, he made a point of being an affectionate parent and something of a homebody.

Like Big Bill, however, Rockefeller could be a sprightly companion for his children. He would get down on all fours and bear them on his back, recapturing a boyish glee that was seldom evident at the office. When they played blindman's buff, he electrified them with daring feints, sudden thrusts, and unexpected, wheeling turns, followed by whoops of delight when he won. Attuned to their fantasy world, he liked to gather the children around him and tell fairy tales. Also like his father, he had an inexhaustible supply of stunts. At dinner, he dazzled the children by balancing fine china plates on the tip of his nose; he also balanced crackers on his nose, then gave them a sudden flip and caught them in his mouth. He taught the children to swim, row, skate, and ride, and he had a talent for devising imaginative outings. On moonlit nights at Forest Hill—the Cleveland estate Rockefeller bought in the 1870s—they ventured forth on bicycle trips, with Rockefeller pinning a large white handkerchief to the back of his coat and leading the children through winding, mysterious forest roads. John Jr. never forgot skating with his father: "The lake was deep, so we took under each arm long narrow boards, which would hold us up in case we broke through the ice. That was characteristic of Father. He always took the utmost care to examine any project thoroughly; then when convinced it was safe, put it through without further question."<sup>12</sup>

Perhaps to create a substitute for theater and other entertainments proscribed by their religion, John and Cettie encouraged the children's musical talents, and each one took up an instrument. They formed their own quartet—with Bessie on violin, Alta on piano, Edith on cello, and John Jr. on violin—so that the house echoed with the works of Mozart, Beethoven, and Handel. The children approached music as serious art, not frivolous amusement, and performed frequently at church events. They weren't barred from playing contemporary popular music.

If there was more merriment in Rockefeller's household than we might have suspected, there was also an underlying sobriety. His children remembered the playful moments, but outsiders were struck by the somber, stuffy atmosphere and found something almost spooky about the Rockefeller home, with one disgruntled tutor leaving this ghastly description: "The elastic step, the laughter of youth, the light heartedness, the romping about, the playfulness, which one is supposed to meet among the young and happy were entirely lacking, lacking almost to dejection. It was a gloomy horizon, with a heaviness that pervaded the entire household. Silence and gloom everywhere."<sup>13</sup>

Rockefeller kept his children hermetically cut off from the world and hired governesses to educate them at home. Aside from church, they never engaged in outside social or civic functions and betrayed a very Baptist fear of worldly entertainments. In the summertime, the children's friends might come to visit for a week or two at a time, but *never* the reverse, and even these playmates were the cautiously screened offspring of John and Cettie's church companions. As John Jr. remembered, "Our interests centered in the house; our friends came there almost wholly. We went rarely, practically none at all, to neighbors' houses."<sup>14</sup> John Jr. hinted that the children brought to visit weren't real companions and were mostly window dressing to gratify his parents. "We had no childhood friends, no school friends."<sup>15</sup> It was a far cry from Thorstein Veblen's image of the spoiled leisure class.

Convinced that struggle was the crucible of character, Rockefeller faced a delicate task in raising his children. He wanted to accumulate wealth while

inculcating in them the values of his threadbare boyhood. The first step in saving them from extravagance was keeping them ignorant of their father's affluence. Until they were adults, Rockefeller's children never visited his office or refineries, and even then they were accompanied by company officials, never Father. At home, Rockefeller created a make-believe market economy, calling Cettie the "general manager" and requiring the children to keep careful account books.<sup>16</sup> They earned pocket money by performing chores and received two cents for killing flies, ten cents for sharpening pencils, five cents per hour for practicing their musical instruments, and a dollar for repairing vases. They were given two cents per day for abstaining from candy and a dime bonus for each consecutive day of abstinence. Each toiled in a separate patch of the vegetable garden, earning a penny for every ten weeds they pulled up. John Jr. got fifteen cents an hour for chopping wood and ten cents per day for superintending paths. Rockefeller took pride in training his children as miniature household workers. Years later, riding on a train with his thirteen-year-old daughter, he told a traveling companion, "This little girl is earning money already. You never could imagine how she does it. I have learned what my gas bills should average when the gas is managed with care, and I have told her that she can have for pin money all that she will save every month on this amount, so she goes around every night and keeps the gas turned down where it is not needed."<sup>17</sup> Rockefeller never tired of preaching economy and whenever a package arrived at home, he made a point of saving the paper and string.

Cettie was equally vigilant. When the children clamored for bicycles, John suggested buying one for each child. "No," said Cettie, "we will buy just one for all of them." "But, my dear," John protested, "tricycles do not cost much." "That is true," she replied. "It is not the cost. But if they have just one they will learn to give up to one another."<sup>18</sup> So the children shared a single bicycle. Amazingly enough, the four children probably grew up with a level of creature comforts not that far above what Rockefeller had known as a boy. Except on Sundays, the girls wore simple gingham dresses and hand-me-downs. In later life, John Jr. confessed sheepishly that until the age of eight he wore only dresses, because he was the youngest child and the three older siblings were girls.<sup>19</sup>

Rockefeller's home secretary saw much of the children because they liked to sit quietly and observe the mysterious clicking of the telegraph wires in her office. She described Rockefeller as extremely gentle with the children but attached to certain fixed principles that he expounded with didactic, wearying repetition. The children were told so often that cards were sinful that they couldn't distinguish one card suit from another. To teach self-restraint, Rockefeller limited them to one piece of cheese daily. One afternoon, little Alta tattled on her younger sister Edith for having eaten *two* pieces of cheese, and Rockefeller professed shock at this epicurean indulgence. As the secretary recalled: "All that afternoon whenever Edith came within hearing her father would say, slowly and impressively, 'Edith was greedy.' At another time both little John and Alta called out, 'Edith took the biggest.' Repeatedly that afternoon, Mr. Rockefeller said in his impressive manner, 'Edith was selfish.'"<sup>20</sup>

Yet the thing to be husbanded most jealously was time. One could neither be too early nor too late. In fact, there was such a fetish about punctuality that it occasioned discernible anxiety among the children. Rockefeller's home secretary said that John Jr. had computed, down to the second, how long it took to get from her telegraph office to the schoolroom upstairs. "After that, whenever I read to the children near school time, John would sit with watch in hand, and his rising was signal for the reading to stop and for the girls to follow him."<sup>21</sup>

Each morning before breakfast, Rockefeller led the family in prayer, meting out a penny fine to latecomers. Everyone took turns reciting from scripture, and John or Cettie elucidated difficult portions and prayed for guidance. Before bed, Cettie listened to the children recite their prayers, and nothing could divert her from this sacred duty. They were encouraged to be active in prayer, especially at Friday night prayer meetings. As John Jr. recalled, at an early age they were encouraged "to take part like the older people, either in a brief word of prayer or a word of personal experience."<sup>22</sup>

Sunday was a heavily regimented day, starting with morning prayers and Sunday school then proceeding through afternoon prayer meetings and culminating with evening hymns. If the children had spare time, they couldn't read novels or worldly literature but had to restrict themselves to the Bible and Sunday-school literature. Strangely enough, the children didn't remember this as oppressive. As John Jr. observed, "A day with such limitations as this would simply appall the modern child. And yet I have only the happiest recollections of the Sundays of my childhood."<sup>23</sup> Cettie turned Sunday into a day for serious reflection, asking the children to reflect upon such weighty maxims as "He who conquers self is the greatest victor" or "The secret of sensible living is simplicity."<sup>24</sup> Leading the children in an hour-long "home talk," she asked each child to select a "besetting sin" and then prayed with the child, asking for God's help in combating the sin. The implicit Baptist message was that people were inherently flawed but—with prayer, willpower, and God's grace—infinately capable of improvement.

In business, John D. Rockefeller operated in a rough, virile world, whereas at home he was surrounded by a harem of doting women that included, at various times, his wife, sister-in-law, mother, mother-in-law, and three daughters. He seemed equally comfortable in these masculine and feminine spheres of existence. When they first got married, John and Cettie lived with his mother Eliza, but she remained behind on Cheshire Street when they moved to Euclid Avenue. For the rest of her life, Eliza rotated among the homes of her five children, who provided her with more security than she had ever known with her prodigal husband. Evidently, she had some idea of where Bill lived, for she had a mailing address and forwarded letters to him from their grandchildren. In a confused manner, the grandchildren knew that their jolly grandfather lived an odd life somewhere out West, but the picture was left deliberately cloudy.

It is hard to retrace Bill's movements with precision, for John D. seldom referred to him in either his business or private papers; his father's banishment was no less psychological than geographic. As best one can piece the story together in these middle years, Bill and his second wife, Margaret, moved to Illinois in 1867 and bought a 160-acre farm in Maroa, with John secretly sending money to help complete the purchase. As the area grew too settled for Bill, the couple moved again in 1875 to Freeport, Illinois, and here Margaret's wanderings, at least, ended. According to stories told later by their Freeport neighbors, Bill—known to them as Dr. William Levingston—was regarded as a profane braggart and con man, a notorious quack doctor who claimed to specialize in cancer and kidney treatments and bought jugs of diuretic from a local druggist that he then resold on the road. Just as the long-suffering Eliza had endured long separations, it was now Margaret's turn to wait as Bill disappeared for months before returning home with thick wads of money, always careful to fold a \$100 bill on the outside. Yet Big Bill never entirely lost touch with his Rockefeller family. From out of the blue, he would materialize in Cleveland, jovial and carefree, and spend several days shooting at targets and playing his fiddle before disappearing for another year. John maintained a frosty civility toward his father, and their meetings tended to be both brief and infrequent. Later on, we shall have

more to say about Bill's queer odyssey, for as his son grew famous, the whereabouts of Doc Rockefeller turned into a national obsession as reporters tried to reconstruct his renegade career.

In marrying Laura "Cettie" Spelman, Rockefeller had found a woman with his mother's gentle tenacity and religiosity. An 1872 photo shows a short, fragile, dark-haired woman with a wide face, high cheekbones, and deep, earnest eyes. Steeped in religious sentiment, she was more likely to be found meditating on a sermon than gossiping about a shopping expedition. Her marriage to John was harmonious, formal, and devoid of quarrels. Like her husband, Cettie was fiercely democratic, disdaining conspicuous consumption and the snobbery of the rich. "She was no respecter of persons," said her son. "To her all men were brothers."<sup>25</sup> She scorned frippery and dismissed fashion plates as vain, silly people. Though always supportive of her husband in his ambitions, she inveighed against "the desperate struggle to obtain the 'almighty dollar.' "<sup>26</sup> Even more of a pinchpenny than John, she wore patches on her clothes and shocked one acquaintance by stating that a young woman needed just two dresses in her wardrobe. Even as her husband grew rich, she continued to perform much of the housework herself, employing two maids and a coachman when they could have afforded many more.

Since he left the house each day and trafficked in a sinful world, John was a broader person than his wife, whose interests contracted sharply after she married. Despite her early bluestocking bent, she lost much of her intellectual brightness as she made the transition from teacher to pedagogical mother, relentlessly molding her children. She liked to quote the maxim, "To be a good wife and mother is the highest and hardest privilege of woman."<sup>27</sup> Where John derived escapist pleasure from the children, Laura took her maternal duties too seriously and was a firm, if loving, martinet. As her son said, she "talked to us constantly about *duty*—and displeasing the Lord and pleasing your parents. She instilled a personal consciousness of right and wrong, training our wills and getting us to want to do the things we ought to do."<sup>28</sup> No less than her husband, she believed in the economical use of time. As one observer said, "She realized her responsibilities, subjecting herself to a fixed daily regimen of duties, dividing her day off methodically into hours and minutes for each, that no moment might be misspent, and no duty neglected."<sup>29</sup>

There was danger in the very congruence of values between John and Cettie, for it made their intellectual life rather airless, allowing no room for disagreement. Had their opinions clashed, John might have been exposed to critical perspectives that could have saved him from his business excesses. Instead, his marriage strengthened his virtuous sense that he was one of God's soldiers and therefore bound to be vilified by sinners. Cettie was similarly braced for the terrible ostracism that came with Rockefeller's wealth. "She was always like the Spartan mothers," said her daughter Edith. "Everything which came to her she accepted, and she bore her frailty of body with uncomplaining patience. . . . She had faith and trust in those she loved and never questioned or criticized."<sup>30</sup>

Cettie's sister Lucy—Aunt Lute, as the children called her—acted as something of a leavening influence in this arid setting. The close relationship of the two sisters was touching since Lute, two years older, was an adopted child. By a strange coincidence, they looked so much alike that everybody assumed they were biological sisters. Lute was bright and cultivated, read contemporary literature, and gave John and Laura a window on secular culture when she read aloud after dinner. Though he was extremely fond of his sister-in-law, Rockefeller found her comically prim and spinsterish and delighted in mimicking the way she lifted her skirts as she mounted the staircase; she would often turn and find him stealthily climbing the steps behind her, aping her in his cutaway coat, much to the family's amusement. In time, Lute developed the prissy manner of the proverbial old maid, and the children, for all their love, found her a little trying. But she was a beloved figure and an integral part of the family, and she introduced some needed cultural enrichment into a household that conformed rigidly to Christian doctrine.

## CHAPTER 8

### Conspirators

The great industrial revolution that transformed America after the Civil War triggered an inflationary boom that swamped the country with goods. When this expanded supply led to lower prices and a deflationary bust, it set the pattern for the rest of the nineteenth century, which experienced huge economic advances, punctuated by treacherous slumps. Lured by easy profits, legions of investors rushed into a promising new field and, when big gluts developed from overproduction, they found it impossible to recoup their investment. This was especially true in new industries where people lacked the caution bred by experience and thus expanded with reckless abandon. As a result, many businessmen began to distrust unfettered competition and flirted with newfangled notions of cooperation—pools, monopolies, and other marketing arrangements that might curb production and artificially buoy prices.

While all commodity prices fluctuated, crude-oil prices were especially volatile. Based on locating deep, unseen pools, the industry was an unpredictable, nerve-racking affair. Every time some lucky devil hit a gusher, this bonanza drove prices down. In 1865, producers began to torpedo wells by exploding gunpowder (later nitroglycerine) deep inside them to shake loose more oil, swelling the surplus. Within a year or two after the Civil War, the oil flood caused prices to skid to as low as \$2.40 a barrel—they had traded as high as \$12 in 1864—leading producers to contemplate forming a cartel to boost prices. The same predicament roiled refining, which had generated astronomical profits at first. As Rockefeller said tartly, the spoiled refiners “were disappointed if they did not make one hundred percent profit in a year—sometimes in six months.”<sup>1</sup> With sky-high profits and ridiculously low start-up costs, the field had soon grown overcrowded. “In came the tinkers and the tailors and the boys who followed the plow, all eager for this large profit,” said Rockefeller.<sup>2</sup>

By the late 1860s, this dynamic produced a pervasive slump in the oil industry, keeping it depressed for the next five years. Low kerosene prices, a boon to consumers, were catastrophic for refiners, who saw the profit margin between crude- and refined-oil prices shrink to a vanishing point. Rampant speculation had so overbuilt the industry that total refining capacity in 1870 was triple the amount of crude oil being pumped. By then, Rockefeller estimated, 90 percent of all refineries were operating in the red. At this bleak impasse, a leading Cleveland rival, John H. Alexander, offered to sell his interest to William Rockefeller at ten cents on the dollar, as the entire industry faced ruin. Worse, the oil market wasn’t correcting itself according to the self-regulating mechanism dear to neoclassical economists. Producers and refiners didn’t shut down operations in the expected numbers, causing Rockefeller to doubt the workings of Adam Smith’s theoretical invisible hand: “So many wells were flowing that the price of oil kept falling, yet they went right on drilling.”<sup>3</sup> The industry was trapped in a full-blown crisis of overproduction with no relief in sight.

Thus, in 1869, one year after his stellar railroad coup, Rockefeller feared that his wealth might be snatched away from him. As someone who tended toward optimism, “seeing opportunity in every disaster,” he studied the situation exhaustively instead of bemoaning his bad luck.<sup>4</sup> He saw that his individual success as a refiner was now menaced by industrywide failure and that it therefore demanded a systemic solution. This was a momentous insight, pregnant with consequences. Instead of just tending to his own business, he began to conceive of the industry as a gigantic, interrelated mechanism and thought in terms of strategic alliances and long-term planning.

Rockefeller cited the years 1869 and 1870 as the start of his campaign to replace competition with cooperation in the industry. The culprit, he decided, was “the over-development of the refining industry,” which had created “ruinous competition.”<sup>5</sup> If this fractious industry was to be made profitable and enduring, he would have to tame and discipline it. A trailblazer who improvised solutions without any guidance from economic texts, he began to envision a giant cartel that would reduce overcapacity, stabilize prices, and rationalize the industry. If Rockefeller first expounded this idea among refiners, he was anticipated by the very drillers who later railed at his machinations. During the Civil War, they had formed an Oil Creek Association to curtail production and lift prices, and on February 1, 1869, they again met in Oil City to create the Petroleum Producers’ Association to protect their interests.

To devise a comprehensive solution for the industry, Rockefeller again needed money: money to create economies of scale, money to build cash reserves to endure downturns, money to heighten efficiency. “And to buy in the many refineries that were a source of overproduction and confusion we needed a great deal of money.”<sup>6</sup> The tricky part for Rockefeller and Flagler was how to supplement their capital without relinquishing control; the solution was to incorporate, which would enable them to sell shares to select outside investors. “I wish I’d had the brains to think of it,” said Rockefeller. “It was Henry M. Flagler.”<sup>7</sup>

*The chaotic, derrick-covered slopes of Oil Creek, Pennsylvania, in 1865. (Courtesy of the Drake Well Museum)*

Luckily, many states had now passed laws permitting companies to incorporate. The one hitch—and it was a formidable one for Rockefeller—was that these firms couldn’t own property outside their state of incorporation; to finesse this restriction would require endless legal legerdemain. On January 10, 1870, the partnership of Rockefeller, Andrews and Flagler was abolished and replaced by a joint-stock firm called the Standard Oil Company (Ohio), with John D. Rockefeller as president, William Rockefeller as vice president, and Henry M. Flagler as secretary and treasurer. Besides echoing their Standard Works refinery, the name advertised the uniform quality of their kerosene at a time when consumers feared explosions from impurities. With \$1 million in capital—\$11 million in contemporary money—the new company became an instant landmark in business history, for “there was no other concern in the country organized with such a capital,” Rockefeller said.<sup>8</sup> Already a mini-empire, Standard Oil controlled 10 percent of American petroleum refining, as well as a barrel-making plant, warehouses, shipping facilities, and a fleet of tank cars. From the outset, Rockefeller’s plans had a wide streak of megalomania. As he told Cleveland businessman John Prindle, “The Standard Oil Company will some day refine all the oil and make all the barrels.”<sup>9</sup>

Despite his lack of legal training, Henry M. Flagler drew up the act of incorporation. Nearly sixty years later, when this document was dredged up in a legal dispute, people were stunned by its simplicity. Instead of a fancy embossed paper, dripping with seals, one reporter described it as “a cheap looking legal paper, faded yellow and of evident poor material, granting the Standard Oil Company the right to engage in business.”<sup>10</sup> This economical, no-nonsense approach appealed to investors, as did Rockefeller’s decision that the leading men would receive no salary but would profit solely from the appreciation of their shares and rising dividends—which Rockefeller thought a more potent stimulus to work.

Standard Oil started out in a modest suite of offices in a four-story building known as the Cushing Block on the Public Square. The office shared by Rockefeller and Flagler was somber and austere. Furnished with funereal dignity, it had a black leather couch and four black walnut chairs with elaborately carved backs and arms, plus a fireplace to provide warmth in winter. Rockefeller never allowed his office decor to flaunt the prosperity of his business, lest it arouse unwanted curiosity.

From the start, he owned more shares of Standard Oil than anybody else and exploited every opportunity to augment his stake. Of the original 10,000 shares, he took 2,667, while Flagler, Andrews, and William Rockefeller each took 1,333; Stephen Harkness took 1,334; and the former partners of Rockefeller, Andrews and Flagler divided another 1,000. The final 1,000 shares went to Oliver B. Jennings, William Rockefeller’s brother-in-law and the first outside investor. An adventurous figure, Jennings had gone to California during the gold rush and profited from selling supplies to prospectors.

Rich investors did not line up to invest in Standard Oil, among other reasons because it was an inauspicious time for new ventures. On September 24, 1869—the infamous Black Friday—Jay Gould and Jim Fisk’s scheme to corner the gold market by manipulating President Grant’s monetary policy collapsed, fomenting financial panic and ruining more than a dozen Wall Street houses. Beyond that, the speculative aura of the oil industry still deterred many reputable businessmen. Rockefeller never forgot how his scheme was savagely derided as a “rope of sand” or how sage businessmen told him that similar attempts to create a Great Lakes shipping cartel had misfired. “Either this experiment will result in a great success or a dismal failure,” one aging financier warned him.<sup>11</sup> As Rockefeller recalled, it was “a course which older and more conservative business men shrank back from and regarded as reckless, almost to the point of insanity.”<sup>12</sup> Embittered by these skeptics and set to prove them wrong, Rockefeller managed to pay dividends of 105 percent on Standard Oil stock during the first year of operations despite one of the worst financial bloodbaths in the industry’s early history.

The man with the hypertrophied craving for order was about to impose his iron rule on this lawless, godless business. As Ida Tarbell described Rockefeller in 1870, he was “a brooding, cautious, secretive man, seeing all the possible dangers as well as all the possible opportunities in things, and he studied, as a player at chess, all the possible combinations, which might imperil his supremacy.”<sup>13</sup> As he scanned the field of battle, the first target of opportunity lay close to home: the twenty-six rival Cleveland refiners. His strategy would be to subjugate one part of the battlefield, consolidate his forces, then move briskly on to the next conquest. His victory over the Cleveland refiners would be the first but also the most controversial campaign of his career.

For his admirers, 1872 was the annus mirabilis of John D. Rockefeller’s life, while for his critics it constituted the darkest chapter. The year revealed both his finest and most problematic qualities as a businessman: his visionary leadership, his courageous persistence, his capacity to think in strategic terms, but also his lust for domination, his messianic self-righteousness, and his contempt for those shortsighted mortals who made the mistake of standing in his way. What rivals saw as a naked power grab, Rockefeller regarded as a heroic act of salvation, nothing less than the rescue of the oil business.

The state of the kerosene trade had further deteriorated in 1871 as prices sagged another 25 percent. As competitors skidded into bankruptcy, Standard Oil declared a 40 percent dividend, with a small surplus to spare. Despite this, John D. Rockefeller sold off a small block of Standard Oil shares—the only time he ever lost heart momentarily—prompting brother William to lament, “Your anxiety to sell makes me feel uneasy.”<sup>14</sup> This discouragement was short-lived. In late 1871, Rockefeller engineered the covert acquisition of Bostwick and Tilford, New York’s premier oil buyers, who owned barges, lighters, and a large refinery at Hunter’s Point on the East River. A former Kentucky banker who had also dealt in cotton and grain and peddled Bibles, Jabez Abel Bostwick was a devout Baptist in the Rockefeller mold: “strict almost to sternness in his business dealings, preferring justice to sentiment,” as one contemporary said.<sup>15</sup> The purchase of Bostwick’s firm gave Rockefeller a sophisticated purchasing agency at a critical moment. Oil prices were now being set on exchanges in western Pennsylvania, with powerful syndicates pushing aside the lone speculators who had once dominated trading. The move set a pattern of stealth that shadowed Rockefeller’s career: Renamed J. A. Bostwick and Company, the newly acquired firm brazenly feigned independence of Standard Oil while acting as its cat’s-paw.

On January 1, 1872, the Standard Oil executive committee, bracing for the tumultuous events ahead, boosted the firm’s capital from \$1 million to \$2.5 million and then to \$3.5 million the next day.<sup>16</sup> Among the new shareholders were several luminaries of Cleveland banking, including Truman P. Handy, Amasa Stone, and Stillman Witt. An intriguing new investor was Benjamin Brewster, a direct descendant of Elder Brewster of the Plymouth colony, who had made a fortune with Oliver Jennings during the California gold rush. It was a sign of Rockefeller’s exceptional self-confidence that he gathered

strong executives and investors at this abysmal time, as if the depressed atmosphere only strengthened his resolve. “We were gathering information which confirmed us in the idea that to enlarge our own Standard Oil of Ohio and actually take into partners with us the refining interest would accomplish the protection of the oil industry as a whole.”<sup>17</sup> On January 1, 1872, the executive committee made its historic decision to purchase “certain refining properties in Cleveland and elsewhere.”<sup>18</sup> This seemingly innocuous resolution was the opening shot of a bloody skirmish that historians came to label the Cleveland Massacre.

The mayhem in Cleveland began when Rockefeller struck a clandestine and richly ironic deal with Tom Scott, the overlord of the Pennsylvania Railroad. As noted, the Pennsylvania had threatened to blot out Cleveland as a refining center, prompting Rockefeller to solidify his ties with the Erie and New York Central systems. Rockefeller had no personal love of Scott and later branded him “perhaps the most dominant, autocratic power that ever existed, before or since, in the railroad business of our country.”<sup>19</sup> Like many railroad executives, Scott had made his reputation during the Civil War by keeping railroad lines open between Washington and the North and winning appointment as an assistant secretary of war. A shrewd, dashing man with long, curling side-whiskers, he wore an enormous felt hat and exuded an aura of power. Of this master political manipulator, Wendell Phillips observed that “as he trailed his garments across the country the members of 20 legislatures rustled like dry leaves in a winter’s wind.”<sup>20</sup> Though Andrew Carnegie was a protégé of Scott before going into the iron and steel business, the railroad executive didn’t appeal to the sanctimonious Rockefeller.

In business matters, however, Rockefeller stood ready to strike a deal with the devil himself. Since he dreaded an alliance between the Pennsylvania Railroad and Pittsburgh and Philadelphia refiners, he wanted to drive a wedge between them. “They went on their knees to [Scott] for rates,” Rockefeller said disparagingly of his rivals. “They revered the Pennsylvania Railroad administration; would do anything at their beck; would do anything to get in return help in the transportation of oil.”<sup>21</sup> So Rockefeller was receptive to an overture from Scott, which came unexpectedly from Peter H. Watson, an official of the rival Lake Shore Railroad and an intimate ally of Commodore Vanderbilt. As president of a Lake Shore branch that joined Cleveland to Oil Creek, Watson had a personal stake in advancing the fortunes of his largest customer, Standard Oil. When Standard Oil expanded its capital in January 1872, Watson quietly pocketed five hundred shares in another example of the growing back-scratching between Rockefeller and the railroads. It was probably through Watson that Commodore Vanderbilt discreetly invested \$50,000 in Standard Oil that year.

On November 30, 1871, Watson met Rockefeller and Flagler at the Saint Nicholas Hotel in New York and presented an audacious scheme devised by Tom Scott, who proposed an alliance between the three most powerful railroads—the Pennsylvania, the New York Central, and the Erie—and a handful of refiners, notably Standard Oil. To implement this, Scott had obtained a special charter for a shell organization bearing the blandly misleading name of the South Improvement Company (SIC). After the Civil War, the venal Pennsylvania legislature had created dozens of such charters by special enactment. These improvement companies possessed such broad, vague powers—including the right to hold stock in companies outside Pennsylvania—that some economic historians have christened them the first real holding companies. The Pennsylvania Railroad had a special purchase on these instruments of corporate power and sometimes traded them for favors.

Under the terms of the proposed pact, the railroads would sharply raise freight rates for all refiners, but refiners in the SIC would receive such substantial rebates—up to 50 percent off crude- and refined-oil shipments—that their competitive edge over rivals would widen dramatically. In the most deadly innovation, the SIC members would also receive “drawbacks” on shipments made by rival refiners—that is, the railroads would give the SIC members rebates for every barrel shipped by *other* refiners. On shipments from western Pennsylvania to Cleveland, for instance, Standard Oil would receive a forty-cent rebate on every barrel it shipped, plus another forty cents for every barrel shipped to Cleveland by competitors! One Rockefeller biographer has called the drawback “an instrument of competitive cruelty unparalleled in industry.”<sup>22</sup> Through another provision, Standard Oil and other SIC refiners would receive comprehensive information about all oil shipped by their competitors—invaluable in underpricing them. The SIC members were naturally sworn to secrecy about the inner workings of this alarming scheme. All in all, it was an astonishing piece of knavery, grand-scale collusion such as American industry had never witnessed.

Though Rockefeller and his coconspirators contended that all refiners were impartially invited to join the SIC, the group excluded refiners from Oil Creek and New York, and Standard Oil was indisputably the driving force. Of the 2,000 shares issued, over one-fourth were held by John and William Rockefeller and Henry Flagler; counting Jabez Bostwick and Oliver H. Payne (soon to be a leader of Standard Oil), the Rockefeller group controlled 900 of 2,000 shares. The SIC president was Peter H. Watson, who held 100 shares and was also now a Standard Oil shareholder, thus ensuring the supremacy of Cleveland refiners over the Pittsburgh and Philadelphia members of the group.

Why did the nation’s leading railroads offer Rockefeller and his confederates terms so generous as to render them all but omnipotent in oil refining? How did they benefit from this association? First, the railroads had engaged in such fierce, internecine price wars that freight rates had fallen sharply. No less than the oil producers, they needed somebody to arbitrate their disputes and save them from their own cutthroat tactics. The cornerstone of the SIC was a provision that Standard Oil would act as “evener” for the three railroads and ensure that each received a predetermined share of the oil traffic: Forty-five percent of the oil shipped by SIC members would travel over the Pennsylvania Railroad, 27.5 percent on the Erie, and 27.5 percent on the New York Central. Unless the railroads had greater control over the oil business, Rockefeller knew, they “could not make the divisions of business necessary so as to prevent rate-cutting.”<sup>23</sup> Rockefeller would become their official umpire and try to govern their pool in a fair, disinterested fashion. As mentioned, the railroads also had an economic interest in greater consolidation among refiners to streamline their own operations. One other factor tempted the railroads to come to terms with Rockefeller: In a farsighted tactical maneuver, he had begun to accumulate hundreds of tank cars, which would be in perpetually short supply.

The SIC—soon exposed as an infamous conspiracy—was a masterful move in Rockefeller’s quest for industrial domination. Both refiners and railroads were struggling with excess capacity and suicidal price wars. Rockefeller’s supreme insight was that he could solve the oil industry’s problems by solving the railroads’ problems at the same time, creating a double cartel in oil and rails. One of Rockefeller’s strengths in bargaining situations was that he figured out what he wanted *and* what the other party wanted and then crafted mutually advantageous terms. Instead of ruining the railroads, Rockefeller tried to help them prosper, albeit in a way that fortified his own position.

Later on, trying to distance himself from the SIC fiasco, Rockefeller scoffed at charges that he had been the ringleader. All along, he insisted, he knew

it would fail and had gone along simply as a tactical maneuver. “We acceded to it because [Tom Scott] and the Philadelphia and Pittsburgh men, we hoped, would be helpful to us ultimately. We were willing to go with them as far as the plan could be used; so that when it failed, we would be in a position to say, ‘Now try our plan.’”<sup>24</sup> Rockefeller’s plan was to unify the industry under Standard Oil. By his own admission, he had not opposed the SIC on ethical grounds but solely as a practical matter, convinced it wouldn’t apply the needed discipline to member refiners. The scheme never bothered his conscience. “It was right,” an unreconstructed Rockefeller said in later years. “I knew it as a matter of conscience. It was right before me and my God. If I had to do it tomorrow I would do it again the same way—do it a hundred times.”<sup>25</sup> Even in hindsight, he couldn’t tolerate doubts about his career but had to present it as one long, triumphal march, sanctified by his religion.

Rockefeller’s assertion that he reluctantly followed the railroads’ lead conveniently distorted the truth. Far from coyly stepping aside and waiting for a misbegotten scheme to founder, he took a leading role and promoted it zealously. We know this because of several remarkable letters he wrote to Cettie from New York, where for several agitated weeks he remained closeted with railroad officials. He knew the negotiations were controversial, since he advised Cettie on November 30, 1871, “A man who succeeds in life must sometimes go against the current.”<sup>26</sup> While these letters confirm that he didn’t originate the scheme, they show that he soon warmed to the project, declaring on December 1, “indeed the project grows on me.”<sup>27</sup> When Watson secured Commodore Vanderbilt’s blessing, Rockefeller was positively jubilant, and he emerged as natural leader of the group, particularly as others grew skittish. In late January 1872, trapped in New York, he wanted to return to Cleveland but told Cettie that “our men *would not hear to it*, they are nervous, and lean on me. . . . I feel like a caged lion and would roar if it would do any good.”<sup>28</sup> Obviously, had Rockefeller wished the SIC to collapse, he would have renounced a leadership position and returned to Cleveland sooner.

The small batch of letters he wrote to Cettie at this time—among his few early, surviving letters to her—betray a surprisingly romantic sensibility, as if seven years of marriage hadn’t dimmed his ardor. Amid negotiations, he told her, “I dreamed last night of the girl Celestia Spelman and awoke to realize she was my ‘Laura.’”<sup>29</sup> Repeatedly, Rockefeller complained about how lonely he felt in New York—“like a wandering Jew”—and reiterated his yearning to be at home. Far from being beguiled by the money, fashion, and power of New York, his Baptist soul recoiled from it. “The world is full of Sham, Flattery, and Deceptions,” he wrote, “and home is a haven of rest and freedom.”<sup>30</sup> At this stage, Rockefeller still found his wealth wonderful and slightly unreal, telling Cettie that “we have been so prospered and placed in *independent* circumstances, it seems a fabulous dream but I assure you it is a solid and comforting fact—how different our condition from the multitudes, let us be thankful.”<sup>31</sup> Perhaps this financial independence emboldened Rockefeller to undertake the risky SIC scheme, confident that it wouldn’t endanger his family’s security. And lest Cettie worry about his risky new venture, he reminded her, “You know we are independently rich outside investments in oil—but I believe my oil stock the very best.”<sup>32</sup>

By late January 1872, as the conspirators drew up and signed the last contracts while trying to preserve total secrecy, rumors of an impending jump in freight rates began to filter through western Pennsylvania. On February 22, the *Petroleum Centre Record* alluded darkly to a “rumored scheme of gigantic combination among certain railroads and refiners to control the purchase and shipment of crude and refined oil from this region.”<sup>33</sup> Definite word of the plot didn’t leak out until days later, when the local freight agent for the Lake Shore Railroad rushed off to visit a dying son and left in charge a subordinate who didn’t realize that the new freight rates hadn’t yet been enacted. Oblivious to the historic impact he would have, this minor functionary promulgated the staggering rates for outside refiners decreed by the SIC. On February 26, the stunned residents of Oil Creek read in the morning papers that freight rates had doubled overnight for everyone—everyone, that is, except a privileged group of refiners in Cleveland, Pittsburgh, and Philadelphia who belonged to a shadowy entity called the South Improvement Company.

For the horror-struck refiners in Titusville or Oil City, this wasn’t simply a new competitive threat: It was a death warrant, and they stopped work and poured into the streets, denouncing the action in strident tones. “The oil region was afire with all sorts of wild stories,” recalled Rockefeller. “There were meetings of protest, of bitter denunciation.”<sup>34</sup> On the night of February 27, three thousand people stormed into the Titusville Opera House, waving banners that stated, “Down with the conspirators,” “No compromise,” and “Don’t give up the ship!” while Rockefeller and his cabal were denounced as “the Monster” and “the Forty Thieves.”<sup>35</sup> Perhaps the most impassioned speaker was a short young refiner named John D. Archbold, the hard-drinking, poker-playing son of a circuit preacher. Though Peter Watson had tried to inveigle him into the SIC, Archbold had indignantly refused and now told the crowd, “We have been approached by the great anaconda, but do not desire to yield.”<sup>36</sup> The Oil Creek refiners believed they had a God-given right to market the oil drilled in their backyards and Archbold—destined, ironically, to succeed Rockefeller at the Standard Oil helm—endorsed this view. “We believe this is the natural point for the business,” he told the cheering audience. “This is the last desperate struggle of desperate men.”<sup>37</sup> After he was elected secretary of a new Petroleum Producers’ Union, the group agreed to retaliate by starving out the SIC conspirators, selling crude oil only to refiners along Oil Creek.

Amid this frenzied hue and cry, the local citizenry created a small army of roving protesters who moved from town to town, organizing torchlight rallies and picking up new adherents. On the night of March 1, refiners and producers jammed another tumultuous meeting at the opera house in Oil City. One featured speaker was a young producer, Lewis Emery, Jr., who supported a proposal by Archbold to cut existing production by 30 percent and suspend new drilling for thirty days. With this speech, the indefatigable Emery launched a crusade against Standard Oil that would persist for decades. By the end of the meeting, a thousand men stood ready to besiege the state capitol in Harrisburg and demand relief from the SIC.

In this warlike atmosphere, the *Oil City Derrick* printed a daily blacklist of the conspirators—Peter Watson, followed by Rockefeller and six other directors—in a black-bordered box on the front page. Each day, a new inflammatory caption was supplied, such as “Behold ‘The Anaconda’ in all his hideous deformity.”<sup>38</sup> It was in the context of such hysterical emotion that the world first learned the name of John D. Rockefeller. As if his foes already intuited his special power, he was singled out for abuse, one newspaper crowning him “the Mephistopheles of Cleveland.”<sup>39</sup> As people learned of his central place in the SIC, vandals defaced the blue Standard Oil barrels with skulls and crossbones. Two Standard employees on Oil Creek, Joseph Seep and Daniel O’Day, barricaded themselves in their offices and fended off marauding mobs. “It was a tense situation,” said Seep. “Some of my friends were actually afraid to be seen talking with me in the street. There were threats of violence. Captain John W. Jones, a big producer, wanted the people to burn the Standard Oil Company’s tanks.”<sup>40</sup> Saboteurs attacked the railroads, raiding oil cars and spilling their contents on the ground or tearing tracks apart. A local lawyer, Samuel C. T. Dodd, said that if the protests had continued indefinitely, “there would not have been one mile of railroad track left

in the County of Venango. The people had come to that pitch of desperation.”<sup>41</sup> Few residents of Oil Creek imagined that their dread adversary was a clean-cut, churchgoing young man. This nightmarish period left an especially deep imprint upon a flabbergasted fourteen-year-old schoolgirl named Ida Tarbell. “I remember a night when my father came home with a grim look on his face and told how he with scores of other producers had signed a pledge not to sell to the Cleveland ogre that also had profited from the scheme—a new name, that of the Standard Oil Company, replacing the name South Improvement Company in popular contempt.”<sup>42</sup>

Far from giving Rockefeller pause, the vandalism only confirmed his view of Oil Creek as a netherworld of rogues and adventurers who needed to be ruled by stronger men. He was always quick to impugn the motives of enemies while regarding his own as somehow beyond reproach. “The Standard Oil Company were a very orderly body, and these producers were a rabble of wild, excitable men, waiting for a war-cry to rush into the arena with a suitable noise.”<sup>43</sup> Clad in the armor of self-righteousness, Rockefeller felt no need to explain his actions and turned away reporters at his door. After Flagler told reporters that Standard Oil’s opponents were “a few soreheads,” Rockefeller advised silence, and Flagler desisted from further comment. With threats being made on his life, Rockefeller posted a special detail of policemen outside both office and home and kept a revolver by his bed for good measure.

Only in the twilight of life did Rockefeller realize how poorly his taciturnity had served him in business battles. This was especially true during the SIC furor, which evolved into a political and public-relations battle. By remaining silent in the face of criticism, he thought he would seem confident and secure in his integrity—in fact, he seemed guilty and arrogantly evasive. Throughout his career, Rockefeller endured abuse with so much equanimity that Flagler once shook his head and said, “John, you have a hide like a rhinoceros!”<sup>44</sup> He had an early Christian’s fierce defiance of critics, his boyhood with Big Bill having also taught him to disregard the malicious gossip of neighbors. He had a great general’s ability to focus on his goals and brush aside obstacles as petty distractions. “You can abuse me, you can strike me,” Rockefeller said, “so long as you let me have my own way.”<sup>45</sup>

As always, the greater the tumult, the cooler Rockefeller became, and a strange calm settled over him when his colleagues were most disconcerted. When pushed, he always stood his ground. The SIC episode showed that Rockefeller was now developing exalted faith in his own judgment. Like all revolutionaries, he saw himself as an instrument of higher purpose, endowed with a visionary faith. He knew that his actions would at first be resisted and misunderstood by the myopic crowd, but he believed that the force and truth of his ideas would triumph in the end.

When the petroleum producers embargoed the sale of crude oil to members of the SIC, Rockefeller professed a lack of concern. Yet this impromptu coalition, welded together by the overwhelming threat, responded with impressive unity, creating sixteen districts, each with a separate committee, that blocked oil sales to the cabal. By moonlight, the producers patrolled Oil Creek on horseback to guard against any clandestine drilling that would subvert their cause. Ida Tarbell recalled how her father had proudly spurned a lucrative contract to ship oil to the conspirators for a tempting \$4.50 a barrel. In the meantime, the producers busied themselves on the legislative front, lobbying in Harrisburg to annul the SIC charter and submitting to the U.S. Congress a scroll-like, ninety-three-foot petition, demanding an industrywide investigation. While Rockefeller dodged the press, producers handed out thirty thousand copies of a polemical tract about the SIC so that “enemies of freedom of trade may be known and shunned by the honest men.”<sup>46</sup>

The uproar didn’t weaken Rockefeller’s resolve, yet for all his bravado the boycott exacted a grave toll on his operations. Ninety percent of his employees had to be temporarily laid off, leaving a skeletal staff at his refineries. In letters to Cettie in March 1872, he tried to reconcile his actions with his conscience as he became the bugbear of Oil Creek. As he wrote from New York on March 15,

*It is easy to write newspaper articles but we have other business. We will do right and not be troubled about what the papers say. By and by when all are through possibly we may briefly respond (though it is not our policy) and leave future events in the business to demonstrate our intentions and plans were just & warranted—I want to act perfectly conscientiously and fearlessly in the matter and feel confident of good results. . . . I am hopeful [we] can get at least a good fraction of the N.Y. Refiners to join at an early day.*<sup>47</sup>

Further, he wrote on March 21, “I am still persevering and hopeful, remember *our* side have not yet been in the papers. We know a *few* things the people generally may not, at all events we know our own intentions, and they are *right* and *only so*—but please say *nothing* only you know your husband will stand by and stick to the right.”<sup>48</sup>

The conspirators committed a major strategic gaffe by omitting the New York refiners, who therefore sided with the Oil Creek refiners to pressure the railroads. To head their liaison committee, the New York refiners appointed a suave thirty-two-year-old named Henry H. Rogers, who had the flashing eyes and confident air of a young buccaneer. When Rogers met Tom Scott at a Philadelphia hotel on March 18, the railroad chief struck a conciliatory note, admitting that the SIC contract was unfair and offering a similar deal to the excluded New York and Pennsylvania refiners. While Scott was backpedaling and angling for peace, Rockefeller remained uncompromising, telling his wife on March 22, “I assure you it is not my pleasure to remain all this time but a stern sense of duty to this cause—I haven’t any idea giving up ship or letting go my hold.”<sup>49</sup>

On March 25, the Rogers group held a climactic meeting with wavering railroad officials at the Erie Railroad’s offices in the ornate Grand Opera House in New York. While they conferred, an edgy Rockefeller and Peter Watson tapped at the door and asked to enter. While Watson was admitted, Rockefeller was barred and so anxiously paced the corridor. For the first time, Rockefeller appeared in *The New York Times*—his name was misspelled as “Rockafellow”—with the reporter noting that, excluded from the talks, Rockefeller had finally gone off looking “pretty blue.”<sup>50</sup> The meeting dealt a blow to Rockefeller and Watson, for the railroads agreed to abrogate the SIC contract, end rebates and drawbacks, and institute uniform rates for all shippers. The serpent had been killed in the egg.

Far sooner than Rockefeller, the railroads had foreseen the political reaction and inevitable defeat. In this era before railroad regulation and antitrust legislation, the SIC contract didn’t violate any obvious laws, only a universal sense of fair play. In early April, the Pennsylvania legislature canceled the SIC charter, while a congressional committee, a month later, branded the scheme the “most gigantic and daring conspiracy” ever to confront a free nation.<sup>51</sup> On April 8, 1872, Rockefeller capitulated and wired the oil producers that all contracts between the SIC and the railroads were now void. In

his own defense, he added: “I state unqualifiedly that reports circulated in the Oil Region and elsewhere, that this company, or any member of it, threatened to depress oil, are false.”<sup>52</sup> On this last count, Rockefeller was probably sincere, for what he envisioned was less a conspiracy against producers than against consumers, a united effort to ensure steady prices and adequate returns on investment. Till the very end, he saw the producers’ outrage against him as shot through with envy and hypocrisy. “The producers . . . held to the view that rebates were wrong unless the rebates were given to them.”<sup>53</sup>

It always mystified Rockefeller that people made such a fuss about a phantom company. “There never was a shipment made or a rebate or drawback collected under the South Improvement plan.”<sup>54</sup> Though only a latent threat, the scheme acquired lasting infamy for two reasons. First, Rockefeller’s fiercest critics regarded it as a dress rehearsal for the grand pageant, the place where he first revealed his master plan, to be implemented in a thousand secret, disguised, and indirect ways. The second reason for all the later attention was that during the brief interval while the SIC was alive, Rockefeller engineered his most important coup: the swift, relentless consolidation of Cleveland’s refineries, which gave him irresistible momentum. The threat of the SIC, critics alleged, was the invisible club that he had waved over Cleveland refiners, forcing them to submit to his domination. Between February 17 and March 28, 1872—between the first rumors of the SIC and the time it was scuttled—Rockefeller swallowed up twenty-two of his twenty-six Cleveland competitors. During one forty-eight-hour period alone in early March, he bought six refineries. As one refiner, John H. Alexander, recalled:

*There was a pressure brought to bear upon my mind, and upon almost all citizens of Cleveland engaged in the oil business, to the effect that unless we went into the South Improvement Company we were virtually killed as refiners; that if we did not sell out we should be crushed out. . . . It was said that they had a contract with railroads by which they could run us into the ground if they pleased.*<sup>55</sup>

Since petroleum output promised to shatter records in 1872 and keep prices depressed, Rockefeller increasingly sought to own as large a portion of the industry as possible and didn’t think he could afford to wait for the marketplace to prune out weak refiners by attrition. “We had to do it in self-defense,” he said of the Cleveland takeovers. “The oil business was in confusion and daily growing worse.”<sup>56</sup>

Another businessman might have started with small, vulnerable firms, building on easy victories, but Rockefeller started at the top, believing that if he could crack his strongest competitor first, it would have a tremendous psychological impact. His major rival was Clark, Payne and Company, and conquering it would give Rockefeller special satisfaction, since he had already tangled with one partner, James Clark, early in his career and now coveted his Star Works refinery. The firm also had social cachet in Cleveland: Colonel Oliver H. Payne— a Yale graduate, honored Civil War colonel, and son of politician Henry B. Payne—was extremely wealthy, lived in a Euclid Avenue mansion, and was descended from one of Cleveland’s founding families. (Commodore Matthew Perry, who opened Japan to commerce in 1854, came from a collateral branch of the family.) With an erect, military bearing and coolly formal manner, many people found the young bachelor pompous—Flagler dubbed him the “kin of God”—but Rockefeller always paid tribute to Payne as a stalwart and capable ally.<sup>57</sup>

One afternoon in December 1871, Rockefeller asked Payne, an old high-school friend, to meet in the parlor of a downtown Cleveland bank, where Rockefeller outlined his plan for a vast, efficient industry under Standard Oil control. Telling Payne about the impending capital increase at Standard Oil, he asked point-blank: “If we can agree upon values and terms do you want to come in?”<sup>58</sup> As Clark, Payne’s largest shareholder, Colonel Payne gave his qualified approval, but he first wanted to examine Rockefeller’s books before selling his company. That afternoon, when he surveyed Standard Oil’s ledgers, he was thunderstruck by the profits. Whether he was impressed by the railroad rebates or operating efficiencies is unclear, but he eagerly told Rockefeller, “Let us get the appraisers in and see what the plant is worth.”<sup>59</sup> After conferring with his partners, Payne consented to a \$400,000 price for his refinery. Rockefeller knew that he was overpaying but couldn’t resist a deal that would certify his position as the world’s largest oil refiner at age thirty-one. Though Rockefeller stipulated that James Clark wasn’t welcome at Standard Oil, he wanted to enlist Payne’s services, and the latter soon shared a private office with Rockefeller and Flagler. James Clark later told Ida Tarbell that he sold out only from fear of the SIC contract. As Tarbell’s assistant reported, “He stated positively that Clark, Payne & Co. did *not* sell out before the organization of the SIC, and that it never considered selling out to the Standard before the SIC was formed.”<sup>60</sup>

According to later lawsuits, whenever Rockefeller suggested that rivals sell out to him, the SIC formed the burden of his appeal. Some old Cleveland refiners told Ida Tarbell that his menacing pitch ran as follows:

*You see, this scheme is bound to work. It means an absolute control by us of the oil business. There is no chance for anyone outside. But we are going to give everybody a chance to come in. You are to turn over your refinery to my appraisers, and I will give you Standard Oil Company stock or cash, as you prefer, for the value we put upon it. I advise you to take the stock. It will be for your good.*<sup>61</sup>

Stung by charges that he had used coercion, Rockefeller retorted that he had been unfailingly friendly and courteous and never mentioned the SIC in negotiations. Strictly speaking, this was probably true, yet the timing of his twenty-two takeovers suggests strongly that the SIC was a prime factor and that the deals were done amid an atmosphere of well-timed intimidation. Several rivals alleged that Rockefeller orchestrated a chorus of terrifying rumors about his secret pact with the railroads. Even without direct threats, he knew his opponents’ imaginations would embellish these stories and conjure up a conspiracy of unfathomable scope. “In 1872 reports were purposely circulated to the effect that the Standard Oil Company had entered into agreement with the railroads, whereby no outside refiner could bring crude oil to Cleveland and manufacture it without a loss,” rival refiner J. W. Fawcett of Fawcett and Critchley told Ida Tarbell in the early 1900s.<sup>62</sup> “The refiners became prematurely alarmed at the reports of destructive competition and inability to secure crude oil, and they ‘fell over each other’ in their haste to sell out. Had they refused to be coerced, and had they held together, there never would have been a Standard Oil Company.”<sup>63</sup> When Fawcett received word that he should see the Standard people and dispose of his refinery, he was told “that they had the railroads in a position where they would control the rates, that Fawcett and Critchley would not ever ship any oil.”<sup>64</sup> Like many vanquished refiners, Fawcett surrendered his independence and went to work for Rockefeller, but he never quite overcame his anger at what he perceived as clever manipulation.

Rockefeller dismissed as “an absolute lie” the idea that he had stampeded the Cleveland refiners and added that the vast majority of those refiners

“were already crushed by the competition which had been steadily increasing up to this time” and were staring at ruin. For these concerns, he insisted, the opportunity to sell to Standard Oil and receive stock instead “was a godsend to them all.”<sup>65</sup> Had Standard Oil not existed, he asserted, these refiners would simply have gone bust—which would have been true for many of them. Even Fawcett conceded that “at that time some of the refineries were not making money, and they were the first to ‘run to cover’ and sell out. Eventually all sold out.”<sup>66</sup>

Several Cleveland refiners claimed that Rockefeller had directly threatened them. John H. Heisel of Bishop and Heisel remembered telling Rockefeller that he wasn’t afraid of him, to which Rockefeller supposedly replied, “You may not be afraid to have your hand cut off, but your body will suffer.”<sup>67</sup> Yet it seems unlikely that Rockefeller menaced refiners quite so blatantly, for it didn’t serve his purpose. Gifted with persuasive powers, he preferred to talk earnestly to his rivals, tapping them on the knee or gesturing with his hands, reasoning with them in richly cadenced, evangelical tones. As one refiner said of Rockefeller, “He knew that he and his associates had a better knowledge of the business and a better command of the business than anyone else. You never saw anyone so confident as he was.”<sup>68</sup> He liked to make Standard Oil sound like a philanthropic agency or an angel of mercy, come to succor downtrodden refiners. “We will take your burdens,” he remembered telling his weaker brethren in 1872. “We will utilize your ability; we will give you representation; we will unite together and build a substantial structure on the basis of cooperation.”<sup>69</sup> Similarly, he said, “We here at Cleveland are at a disadvantage. Something should be done for our mutual protection. We think this plan of ours is a good scheme. Think it over. We would be glad to consider it with you if you are so inclined.”<sup>70</sup> Sure of his mission, Rockefeller castigated those who resisted Standard Oil as foolish and shortsighted. “Take Standard Oil stock,” he urged them, “and your family will never know want.”<sup>71</sup>

If these refiners had surrendered faith in oil’s future, as Rockefeller insisted, then why did they so bitterly resent him after he bought them out? Why didn’t they regard him as their savior, as he preferred to depict himself? The answer lies partly in the way their plants were appraised. Since so many refiners were losing money, Rockefeller paid them a pittance, typically a quarter of their original construction costs, or what the plants might have fetched if auctioned off for scrap; he paid little or nothing for goodwill—that is, the intangible value in a thriving business, such as its reputation or client list. If this was hard policy, it wasn’t necessarily unscrupulous. “No, the good will of a business which is losing money is not worth much,” said Rockefeller.<sup>72</sup> “If there isn’t work for an oil refinery to do, it has less value than ships or railroad property, which can be used on other lines.”<sup>73</sup> One must also remember that Rockefeller was in the anomalous position of taking over many plants not to operate them but to shut them down and eliminate excess capacity. He ridiculed many of the refineries he bought as “old junk, fit only for the scrap heap.”<sup>74</sup> Rockefeller probably paid a fair price for many antiquated plants, but it was a bitter pill for the ruined owners to swallow. And he operated in a climate of fear that gave his rivals little choice in the matter.

Whether by chance or design, Rockefeller’s 1872 business papers have vanished, and we aren’t privy to his thoughts during these crucial negotiations. But in later years, he was a fair-minded bargainer who often paid too much for properties that served a strategic purpose. Indeed, his papers are chock-full of lamentations about how he overpaid for properties. When it came to mergers, he didn’t fight for the last dollar and tried to conclude matters cordially. Since he aimed to convert competitors into members of his cartel and often retained the original owners, he preferred not to resort to naked intimidation. As Rockefeller said, he and his colleagues weren’t “so short-sighted as to antagonize these very men whom they were eager to have come into a close and profitable relationship with them.”<sup>75</sup> He wasn’t a sadistic man, but he had a hard, unyielding sense of purpose that brooked no opposition. If Rockefeller expressed elation, it was behind closed doors. According to one legend, after taking over a new refinery, he would rush into the office, perform a little dance, and shout joyously to Sam Andrews, “We’ve got another refinery, Sam. One more in the fold!”<sup>76</sup>

During the Cleveland Massacre, Rockefeller savored a feeling of sweet revenge against some of the older men who had patronized him when he started in business. This was especially true of his negotiations with Alexander, Scofield and Company, whose partners included his original boss, Isaac L. Hewitt. After Hewitt came to Rockefeller’s Euclid Avenue home to plead for mercy, they strolled down Euclid Avenue together, and Rockefeller told him his firm would never survive if it didn’t sell out to Standard Oil. He made a cryptic statement to Hewitt that entered into Rockefeller folklore: “I have ways of making money you know nothing about.”<sup>77</sup> Disconcerted by such assertions, Hewitt and his partners finally sold out for \$65,000, though they believed their business was worth \$150,000. Rockefeller felt merciful toward Hewitt and loaned him money to buy Standard stock, but he despised Hewitt’s partner, John H. Alexander, who still viewed him, he thought, as Hewitt’s former clerk. As Rockefeller put it, “How could this conceited Englishman ever conceive it possible that a young man who had been a bookkeeper, and especially at a time when he had been employed in an oil refinery, be qualified to lead in a movement of this kind?”<sup>78</sup>

Rockefeller’s most controversial purchase—and one that resulted in a bitter lawsuit—was the takeover of Hanna, Baslington and Company. When Robert Hanna, the uncle of Mark Hanna, was summoned to Standard Oil’s offices, he bluntly told Rockefeller that he wouldn’t sell. In response, Rockefeller sighed and wearily shrugged his shoulders, as if expressing regret that this benighted sinner hadn’t seen the light. “You will stand alone,” he warned Hanna. “Your firm can never make any more money in Cleveland. No use trying to do business in competition with the Standard Oil Company. If you do it will end in your being wiped out.”<sup>79</sup> What seemed a barefaced threat to Hanna was later interpreted by Rockefeller as a timely warning and sincere advice.

Irate over the rebates enjoyed by Standard Oil, Hanna pleaded with executives of the Lake Shore Railroad to grant his refinery equal treatment. They defended Standard Oil’s freight rates as the privilege due to a big bulk shipper and promised to give Hanna the same rates if he delivered the same volume of oil—which he couldn’t. The railroads employed this as an all-purpose defensive tactic, since nobody could ever match Standard Oil’s voluminous shipments. In the end, Hanna accepted \$45,000 for a refinery that he believed was worth \$75,000.

It is interesting to note that Rockefeller perjured himself in an affidavit he submitted for the lawsuit brought jointly by William S. Scofield and Hanna, Baslington. Not only did he state that “but few persons who were stockholders in the Standard Oil Co. of Cleveland, Ohio were subscribers to stock in the South Improvement Company,” but he added that “P. H. Watson, Pres. of the South Improvement Co. . . . was not a stockholder in nor was he in any way connected with the Standard Oil Company.”<sup>80</sup> As mentioned, Standard Oil executives controlled almost 50 percent of the SIC shares and issued five hundred shares of Standard to Watson sub rosa in the January 1872 recapitalization. Although Rockefeller professed that he never lied under oath, the claim doesn’t bear up under close examination.

The oil wars of 1872 turned Cleveland society upside down. Many who had made easy fortunes in oil refining and built splendid mansions on Euclid Avenue found themselves bankrupt and forced to sell. Whether it was Rockefeller or the slumping oil market that forced them to sell their refineries at distress-sale prices, they chose to see Rockefeller as the author of their woes. It is likely that in many cases the marketplace would eventually have closed their unprofitable firms, but Rockefeller certainly speeded up the winnowing. Though several independent refiners held on for a few years, in most cases this merely postponed the day of reckoning. Ella Grant Wilson, a social chronicler of nineteenth-century Cleveland, recalled how her father, a partner in the refinery of Grant, Foote and Company, had befriended Rockefeller in various Baptist causes but refused to join Standard Oil, convinced it would fail. When it became impossible to compete with this leviathan, his refinery went bankrupt, and he surrendered his life savings. “Father went almost insane over this terrible upset to his business. He walked the house night and day. . . . [He] left his church and never entered a church afterward. His whole life was embittered by this experience.”<sup>81</sup> With so many losers in the struggle—and one shrewd, gigantic winner—it comes as no surprise to learn that John D. Rockefeller had made his first group of implacable enemies.

Nowadays, most people imagine that American businessmen have always favored free competition, at least in the abstract. But in the industrial boom after the Civil War, the most significant revolt against free-market capitalism came not from reformers or zealous ideologues but from businessmen who couldn’t control the maddening fluctuations in the marketplace. In an unregulated economy, they had to improvise the rules of the game as they went along. Pestered by overproduction in the early oil industry, Rockefeller tirelessly mocked those “academic enthusiasts” and “sentimentalists” who expected business to conform to their tidy competitive models. Like some of his contemporaries, he didn’t see how they could build vast, enduring industries in a volatile economy disrupted by recessions, deflation, and explosive boom-and-bust cycles, and he decided to subjugate markets instead of responding endlessly to their changing price signals. Thus, Rockefeller and other industrial captains conspired to kill competitive capitalism in favor of a new monopoly capitalism.

Economic historians often cite the exuberance of Gilded Age businessmen, their red-blooded faith in America’s future, without noting the constant uncertainty that lurked underneath. As Rockefeller’s story shows, many of the age’s most controversial business practices were forged in a desperate spirit of self-preservation. “It was forced upon us,” Rockefeller said of Standard Oil’s genesis. “We had to do it in self-defence. The oil business was in confusion and daily growing worse. Someone had to make a stand.” Though he foresaw the triumph of cooperation, its far-ranging ramifications weren’t yet clear to him. “This movement was the origin of the whole system of economic administration. It has revolutionized the way of doing business all over the world. The time was ripe for it. It had to come, though all we saw at the moment was the need to save ourselves from wasteful conditions.” Then he added, as if enunciating his economic credo: “The day of combination is here to stay. Individualism has gone, never to return”<sup>82</sup>

Of course, companies had colluded to restrain the open play of market forces before. In Europe, guilds and state monopolies were of ancient provenance, and even Adam Smith had noted the alacrity with which businessmen hatched conspiracies against consumers. In 1872, Standard Oil was just one of many companies whose leaders had daydreams of controlling prices and production throughout their industry. When the SIC scheme surfaced, one newspaper observed, “This great monopoly is one of many now forming to control the commercial products of this great nation,” and it referred to the western grain and livestock trades as analogous situations.<sup>83</sup> As his own inspiration, Rockefeller cited Western Union, then busily buying up small telegraph lines, and the New York Central Railroad, which had consolidated its trunk line from the Atlantic seaboard to Chicago. During the 1870s, pools and rings flourished among salt, rope, and whiskey concerns.

It was only fitting that someone with Rockefeller’s personality and values should have questioned the canons of free-for-all capitalism. If the most creative and dynamic of economic systems, capitalism can also seem wasteful and inefficient to those who endure its rocky transitions and violent dislocations. By bringing forth superior methods, capitalism renders existing skills and equipment outmoded and thus fosters unceasing turmoil and change. Such a mutable system violated Rockefeller’s need for stability, order, and predictability. Indeed, the sober, thrifty Puritan identified by Max Weber as the prototypical capitalist was almost certain to feel distressed by this unstable economy, which forced him to steer his orderly business through a maelstrom of incessant change.

From the three-year interview he gave privately to William O. Inglis in the late 1910s, it is clear that Rockefeller brooded for many years on a theoretical defense of monopoly. His comments are fragmentary and do not cohere into a full-blown system, yet they show that he gave the subject a great deal of intelligent thought, much more than one might have expected. He knew that he had latched on to a mighty new principle, and arose as the prophet of a new dispensation in economic history. As he said, “It was the battle of the new idea of cooperation against competition, and perhaps in no department of business was there a greater necessity for this cooperation than in the oil business.”<sup>84</sup>

Rockefeller’s logic deserves some scrutiny. If, as he asserted, Standard Oil was the efficient, low-cost producer in Cleveland, why didn’t he just sit back and wait for competitors to go bankrupt? Why did he resort to the tremendous expense of taking over rivals and dismembering their refineries to slash capacity? According to the standard textbook models of competition, as oil prices fell below production costs, refiners should have retrenched and padlocked plants. But the oil market didn’t correct itself in this manner because refiners carried heavy bank debt and other fixed costs, and they discovered that, by operating at a loss, they could still service some debt. Obviously, they couldn’t lose money indefinitely, but as they soldiered on to postpone bankruptcy, their output dragged oil prices down to unprofitable levels for everybody.

Hence, a perverse effect of the invisible hand: Each refiner, pursuing his own self-interest, generated collective misery. As Rockefeller phrased it, “Every man assumed to struggle hard to get all of the business . . . even though in so doing he brought to himself and the competitors in the business nothing but disaster.”<sup>85</sup> In a day of primitive accounting systems, many refiners had only the haziest notion of their profitability or lack thereof. As Rockefeller noted, “often-times the most difficult competition comes, not from the strong, the intelligent, the conservative competitor, but from the man who is holding on by the eyelids and is ignorant of his costs, and anyway he’s got to keep running or bust!”<sup>86</sup>

What made an expeditious shutdown of outmoded rivals vital to Rockefeller was that he had borrowed heavily to build gigantic plants so that he could drastically slash his unit costs. Even his first partner, Maurice Clark, remembered that “the volume of trade was what he always regarded as of paramount importance.”<sup>87</sup> Early on, Rockefeller realized that in the capital-intensive refining business, sheer size mattered greatly because it translated

into economies of scale. Once, describing the “foundation principle” of Standard Oil, he said it was the “theory of the originators . . . that the larger the volume the better the opportunities for the economies, and consequently the better the opportunities for giving the public a cheaper product without . . . the dreadful competition of the late ’60’s ruining the business.”<sup>88</sup> During his career, Rockefeller cut the unit costs of refined oil almost in half, and he never deviated from this gospel of industrial efficiency.

To service the outsize debt that made this possible, Rockefeller needed to smooth out the inordinate price fluctuations that made the oil business so hazardous. Realizing that the higher the economic peaks the deeper the subsequent troughs, Rockefeller feared booms no less than busts. “Neither the depressions nor the advances were profitable. The depressions gave occasion to the advances; so that the conditions of the depressions had to be offset by the advances. I concede that so far as the oil industry was concerned we were successful in preventing to an extent these extremes so trying and unprofitable.”<sup>89</sup> Rockefeller preferred moderate growth purely as a matter of self-interest. His goal was to forestall potential competitors through low prices and thus minimize risk and chance disruptions. By this approach, Rockefeller believed, he could beneficently spare Standard Oil employees the plight of other industrial workers who “find themselves in each period of ten or fifteen years in destitute circumstances, with bankrupt employers, owing to the foolish and universal competitive methods accompanying the excessive production of any and all products.”<sup>90</sup>

At times, when he railed against cutthroat competition and the vagaries of the business cycle, Rockefeller sounded more like Karl Marx than our classical image of the capitalist. Like the Marxists, he believed that the competitive free-for-all eventually gave way to monopoly and that large industrial-planning units were the most sensible way to manage an economy. But while Rockefeller had faith in such private monopolies, the Marxists saw them as merely halfway houses on the road to socialism.

The most tantalizing question in Rockefeller’s story—and one that allows no final answer—is whether Standard Oil stimulated or retarded the oil industry’s growth. Rockefeller’s foremost academic supporter, Allan Nevins, believed that after the Civil War it was so cheap and easy to enter oil refining that only a monopoly could have curbed surplus capacity and brought order to the industry. Without Standard Oil, he argued, the business would have fragmented into small, antiquated units, and oil gluts, with their accompanying low prices, would have persisted indefinitely. Rockefeller believed that only a firm with the strength of Standard Oil could have attained the necessary economies of scale at that stage of the industry’s development.

Long after Rockefeller had exited the industrial scene, various economists, while espousing the general superiority of competition, conceded the economic wisdom of trusts under certain conditions. The conservative, Austrian-born economist Joseph A. Schumpeter, for example, contended that monopolies might prove beneficial during depressions or in new, rapidly shifting industries. By replacing turmoil with stability, a monopoly “may make fortresses out of what otherwise might be centers of devastation” and “in the end produce not only steadier but also greater expansion of total output than could be secured by an entirely uncontrolled onward rush that cannot fail to be studded with catastrophes.”<sup>91</sup> Schumpeter imagined that entrepreneurs wouldn’t commit large sums to risky ventures if the future seemed cloudy and new competitors could easily spoil their plans. “On the one hand, largest-scale plans could in many cases not materialize at all if it were not known from the outset that competition will be discouraged by heavy capital requirements or lack of experience, or that means are available to discourage or checkmate it so as to gain the time and space for further developments.”<sup>92</sup> As we shall see, Rockefeller keenly felt a need to freeze the industry’s size, stymie new entrants, and create an island of stability in which expansion and innovation could then occur unimpeded.

When Rockefeller took over competing refiners, he retained plants with up-to-date facilities and shuttered obsolete ones. It would have been impossible to shrink the industry and steady prices, however, if those who sold their outmoded plants took the money only to open new refineries. Unencumbered by antitrust laws, Rockefeller forced these refiners to sign restrictive contracts that prohibited them from sneaking back into the oil business. Rockefeller regarded these agreements—which would today be outlawed as in restraint of trade—as sacred obligations. For the most part, they were faithfully honored, though on several occasions Rockefeller hauled violators into court.

For all the uproar about Rockefeller’s predatory tactics, many refiners continued to defy him, and dozens of small independents survived outside of Standard Oil. Rockefeller lured many of them into his tent with an intermediate step that he called “running arrangements,” in which Standard Oil guaranteed them a certain level of profits if they accepted a ceiling on their output. This allowed Standard Oil to restrict the output of rivals and made Rockefeller, a hundred years before the Organization of Petroleum Exporting Countries (OPEC), the chief administrator of a sweeping oil cartel. Much like OPEC leaders, Rockefeller had to arbitrate demands for increased quotas among restive members and cope with the immemorial problem of cartels: how to prevent cheaters. Whenever refiners with running arrangements exceeded their assigned allotment, Standard Oil, as the swing producer, curtailed its own output to maintain prices—exactly the dilemma faced by Saudi Arabia as the world’s largest oil exporter in the 1970s. This situation steeled Rockefeller in his determination to own his competitors instead of just presiding over a confederation of perennially warring members.

Where Rockefeller differed most from his fellow moguls was that he wanted to be both rich *and* virtuous and claim divine sanction for his actions. Perhaps no other businessman in American history has felt so firmly on the side of the angels. Critics were quick to spy an oily sanctimony in this servant of God and Mammon and wonder why his religious beliefs didn’t trammel his acquisitive nature. They converted him into a wily Machiavellian or a stock figure from a Balzac novel—the pious, cunning hypocrite who showily attends church on Sunday then spends the rest of the week trampling rivals underfoot. More generous critics argued that he simply led parallel lives, with a complete separation of his public and private selves. Rockefeller himself felt no such discontinuity and always insisted that his private and commercial activities should be judged by the same exacting standards. Many years later, William O. Inglis read to him John Milton’s stern denunciation of King Charles I: “For his private virtues they are beside the question. If he oppress and extort all day, shall he be held blameless because he prayeth night and morn?” In response, Rockefeller exclaimed, “That’s well put! And the oil men have got to stand the test of that.”<sup>93</sup> Clearly, he felt that his business conduct could withstand the most rigorous scrutiny.

It is too glib to say that Rockefeller was a hypocrite who used his piety as a cloak for greed. The voice that reverberated in his ears was one of burning zeal, not low, devious cunning. He was a sincere if highly self-serving churchgoer and, however deluded, extremely devout. From an early age, he had learned both to use and to abuse religion, to interpret and to misinterpret Christian doctrine to suit his purposes. The church provided him with a stock of images and ideas that, instead of checking him, enabled him to proceed with a clear conscience. Religion validated his business misdeeds no less than his charitable bequests, buttressing his strongest impulses. If religion made him great, it also armed him with theological justification for his

actions and may have blinded him to their brutal consequences.

To reiterate an earlier point, John D. regarded God as an ally, a sort of honorary shareholder of Standard Oil who had richly blessed his fortunes. Consider this impassioned outburst he made to a reporter:

*I believe the power to make money is a gift from God—just as are the instincts for art, music, literature, the doctor’s talent, the nurse’s, yours—to be developed and used to the best of our ability for the good of mankind. Having been endowed with the gift I possess, I believe it is my duty to make money and still more money, and to use the money I make for the good of my fellow man according to the dictates of my conscience.* <sup>94</sup>

For Rockefeller, there was a perfect fusion of Christianity and capitalism and, given his extensive church involvement, it would have been odd if his career hadn’t been saturated with his own version of evangelical Protestantism. Even the business of drilling and refining oil was wrapped for him in religious mystery. “The whole process seems a miracle,” he once said. “What a blessing the oil has been to mankind!” <sup>95</sup> In pleading for his oil monopoly, Rockefeller always exhibited many qualities of the Baptist missionary. He needed to endow his aggressive business tactics with transcendent purpose and elevate his material designs into holy crusades. When faced with the squalid disorder of the oil business in the early 1870s, he converted Standard Oil, in his own mind, into the moral equivalent of the Baptist Church. His career as a trust king would be for him a Christian saga, a pilgrim’s progress, where he was the exemplary man, rescuing sinful refiners from their errant ways.

What’s most striking, both in the extensive Inglis interview and elsewhere, is that every time Rockefeller explained the rationale for Standard Oil, he resorted to patently religious imagery. “The Standard was an angel of mercy, reaching down from the sky, and saying, ‘Get into the ark. Put in your old junk. We’ll take all the risks!’” <sup>96</sup> He referred to Standard Oil as “the Moses who delivered them [the refiners] from their folly which had wrought such havoc in their fortunes.” <sup>97</sup> Charged with destroying competition, Rockefeller was indignant: “I repeat again, it was not a process of destruction and waste; it was a process of upbuilding and conservation of all the interests . . . in our efforts most heroic, well meant—and I would almost say, reverently, Godlike—to pull this broken-down industry out of the Slough of Despond [for which] we are charged with criminal proceedings.” <sup>98</sup> Far from being an outlaw band, Standard Oil had “rendered a missionary service to the whole world. Strong as this statement is, it is the Gospel truth.” <sup>99</sup> Further, “Faith and work were the rocks upon which Standard Oil was built.” <sup>100</sup> He credited Standard Oil with “the salvation of the oil business and making it a reputable pursuit instead of a disgraceful, gambling, mining scheme.” <sup>101</sup> While he and his partners were “missionaries of light” and tried to treat weaker competitors with compassion, there were limits to their tolerance since they could not “stop the car of salvation in their great enterprise which meant so much to the consuming public the world over.” <sup>102</sup> If his stewardship of Standard Oil exposed him to vitriolic persecution, it was exactly the martyrdom he expected.

Rockefeller has often been described as a social Darwinist who viewed the harsh struggle of capitalism as a salutary process that rewarded the industrious and punished the lazy. And it is true that he adamantly opposed any government program or private charity that sapped the frontier spirit of self-reliance. Yet Rockefeller could hold contradictory views on essential matters, and his philosophic justification of cooperation rested heavily upon a direct refutation of social Darwinism:

*The struggle for the survival of the fittest, in the sea and on the land the world over, as well as the law of supply and demand, were observed in all the ages past until the Standard Oil Company preached the doctrines of cooperation, and it did cooperate so successfully and so fairly that its most bitter opponents were won over to its views and made to realize that rational, sane, modern, progressive administration was necessary to success.* <sup>103</sup>

Standard Oil was thus presented as the *antidote* to social Darwinism, a way to bring universal brotherhood to a fractious industry. Without Standard Oil, said Rockefeller, “there would have been the survival of the fittest—and we had proved ourselves to be the fittest, and we could have picked up the wrecks as the less fortunate brethren went down. This we did not do, but tried to call a halt and avert the impending disaster.” <sup>104</sup> Standard Oil would be a cooperative commonwealth, open to refiners who renounced their selfish ways to join the faithful. It would be for Rockefeller a unique case of the strong showing mercy to their weaker brethren by inviting them to participate in a common effort to save the industry.

In a critical distinction, he viewed competitive capitalism—and not capitalism per se—as producing a vulgar materialism and rapacious business practices that dissolved the bonds of human brotherhood. In a state of ungoverned competition, selfish individuals tried to maximize their profits and thereby impoverished the entire industry. What the American economy needed instead were new cooperative forms (trusts, pools, monopolies) that would restrain grasping individuals for the general good. Rockefeller thus tried to reconcile trusts with Christianity, claiming that cooperation would end the egotism and materialism abhorrent to Christian values. It was an ingenious rationalization. While religion did not lead him to the concept of trusts, it did enable him to invest his vision of cooperation with a powerful moral imperative.

From the outset, Standard Oil was permeated by an us-versus-them attitude that emanated from the top. At moments, Rockefeller made it sound as if he and his colleagues were a band of early Christians, misunderstood by the pagans. In this moralistic frame of mind, he was bound to see his opponents as benighted, misguided people, “governed by their narrow jealousies and unwarranted prejudices” and unaware that the old gods were now obsolete. <sup>105</sup> Rockefeller developed an inverted worldview, accusing his critics of exactly the same sins of which they accused him. Far from seeing himself as a rascal or bully, the Standard Oil chieftain presented himself as a respectable gentleman who attempted in vain to reason with wicked independents. In his correspondence, Rockefeller betrayed a characteristic manner of referring to his rivals: They were selfish people forever stirring up trouble or creating annoyances, like so many mischievous children who needed a good stiff spanking from father. Never conceding any legitimacy to dissent, Rockefeller denigrated his critics as blackmailers, sharpsters, and crooks. He was now dangerously impervious to criticism.

## The New Monarch

Fresh from the South Improvement Company brouhaha and the bruising struggle over the Cleveland refineries, Rockefeller didn't pause to catch breath. Anybody else might have consolidated his gains and proceeded cautiously, but Rockefeller, a man in a hurry, launched a new offensive instead. The SIC contretemps had stranded him in an untenable spot. Since Cleveland refiners paid the same freight rates as other refining centers, they labored under a huge competitive handicap, paying fifty cents a barrel just to ship crude oil to Cleveland before sending on the refined oil to New York; by contrast, a Titusville refiner shipped straight to the seaboard. In April 1872, Henry Flagler again extracted concessions from the Lake Shore Railroad but not enough to appease Rockefeller. Because the Pittsburgh refiners shared a similar cost disadvantage, Rockefeller decided to make common cause with them and press the railroads for new discounts.

With unmitigated cheek, Rockefeller decided that if the Oil Regions couldn't tolerate a small, secret consortium such as the SIC, he would confront them with a giant public consortium of refiners. In mid-May 1872—scarcely more than a month after the railroads scrapped the SIC—Rockefeller and Flagler journeyed to Pittsburgh to meet with the city's three foremost refiners, William G. Warden, William Frew, and O. T. Waring. The group then went by train to Titusville, bearing a plan for a new National Refiners' Association, which would be popularly dubbed the Pittsburgh Plan. This venture envisioned a new refiners' cartel, headed by a central board that would negotiate advantageous terms with the railroads and maintain prices by assigning refining quotas to members. Eschewing subterfuge, the confederation was thrown open to all refiners, but with John D. Rockefeller serving as president.

Before long, Rockefeller was so detested in the Oil Regions that he ceased to visit and retreated to the status of a dim, shadowy legend; no authenticated photo shows him in the rural backwater to which he owed his fortune. Though the National Refiners' Association theoretically embraced all comers, the Titusville refiners saw the group as the old SIC in disguise, and local newspapers admonished oilmen to beware of the slippery, smooth-talking men from Cleveland. On the Titusville streets, Rockefeller was greeted with the somber respect accorded a new monarch. As always, he presented a cordial façade that disarmed people and in one office after another reassured wary refiners, "You misunderstand our intention. It is to save the business, not to destroy it that we are come."<sup>1</sup> At two turbulent public meetings, Flagler was hooted and jeered while Rockefeller stared impassively at the audience. One refiner left an indelible portrait of Rockefeller's aloof, cryptic manner at a private meeting:

*One day several of us met at the office of one of the refiners, who, I felt pretty sure, was being persuaded to go into the scheme which they were talking up. Everybody talked except Mr. Rockefeller. He sat in a rocking chair, softly swinging back and forth, his hands over his face. I got pretty excited when I saw how those South Improvement men were pulling the wool over our men's eyes, and making them believe we were all going to the dogs if there wasn't an immediate combination to put up the price of refined and prevent new people coming into the business, and I made a speech which, I guess, was pretty warlike. Well, right in the middle of it John Rockefeller stopped rocking and took down his hands and looked at me. You never saw such eyes. He took me all in, saw just how much fight he could expect from me, and I knew it, and then up went his hands and back and forth went his chair.*<sup>2</sup>

At a second big public meeting, the Pittsburgh Plan was defeated resoundingly by local refiners, yet Rockefeller still gained ground, having enlisted influential local defectors, especially his erstwhile foe, young John D. Archbold. During the following months, in a divide-and-conquer policy, Rockefeller tried to isolate the Oil Creek refiners by successfully recruiting into his Pittsburgh Plan refiners from the other major centers.

But before long, this cartel was bedeviled by cheaters exceeding their quotas. It also grappled with what economists call the "free rider" problem—that is, opportunistic refiners stayed outside the plan and enjoyed the higher prices it produced without being bound by its production limits. As Rockefeller later said in a comparable situation, "These men who claimed that they had been 'crushed' and 'ruined' by the Standard Oil Company were existing under its shelter and protection."<sup>3</sup> And he was besieged by problems closer to home. After Standard Oil bought decrepit old refineries in Cleveland to cut back on capacity, many sellers violated their covenants and started up new plants with improved equipment. They were drawn back, Rockefeller argued, only because he had markedly improved conditions and boosted prices. To complicate matters, new refiners now entered the business expressly to blackmail him into buying them out.

In the end, frustrated by rampant cheating and freeloaders, Rockefeller gathered refiners in Saratoga Springs, New York, on June 24, 1873, and dissolved the short-lived Pittsburgh Plan. He was momentarily disheartened by this failure, which again confirmed his preference for outright fusion rather than an unwieldy federation of firms. "There are some people whom the Lord Almighty cannot save," he later said wearily of the Oil Creek refiners. "They don't want to be saved. They want to go on and serve the devil and keep on in their wicked ways."<sup>4</sup>

In her influential polemic, Ida Tarbell evoked a paradise of free, independent producers in western Pennsylvania, "ruddy and joyous" men, enamored of competition, who were snuffed out by the sinister Standard Oil. In her morality play, Rockefeller was the venomous toad in this garden of earthly delights. In fact, the producers didn't respond to Rockefeller by advocating freer competition but by forming their own counterconspiracy. In the summer of 1872, under the aegis of the Petroleum Producers' Association, they approved a moratorium on new drilling to steady prices and briefly called for a complete halt to production. The producers terrorized each other, meting out nocturnal punishment to noncooperators by setting their wells ablaze or smashing their pumping engines with sledgehammers. The producing end of the industry was populated by thousands of freebooting, high-spirited speculators who were far harder to organize than the more sober refiners, concentrated in a few urban centers—something that gave Rockefeller a decided edge.

So long as he could maintain ample spreads between crude and refined prices, Rockefeller blessed the producers' efforts to impose higher prices and control output. It was a common misconception along Oil Creek—and one that fed anti-Rockefeller demonology—that he was trying to drive drillers to the wall to keep prices low. In reality, he was fully prepared to deal with a strong producers' cartel so long as they capped production. On December 19, 1872, Rockefeller met with producers at the Fifth Avenue Hotel in New York and signed the so-called Treaty of Titusville. Under this agreement,

the refiners' association pledged to buy oil from the producers' association at five dollars a barrel—nearly *twice* the spot market rate—in exchange for tightly enforced production limits. The agreement crumbled not because of Rockefeller but because producers couldn't enforce discipline in their ranks. Instead of throttling the oil flow, they scrambled to pump more, with wholesale cheating driving the price as low as two dollars a barrel on the crude-oil market. Many small drillers outside the producers' association took advantage of the pact to undersell their bigger competitors.

This behavior ratified Rockefeller's low opinion of the producers as dissolute, unreliable men who couldn't contain a "wild and uncontrollable element" that "would sneak out at midnight and start the pumps going so that the oil might flow before the songs of the birds were heard."<sup>5</sup> With the oil industry drowning in another glut, Rockefeller terminated the agreement in January 1873, chiding the recalcitrant producers: "You have not kept your part of the contract—you have not limited the supply of oil—there is more being pumped today than ever before in the history of the region."<sup>6</sup> While uncontrollable drilling was to blame, the producers found it easier to scapegoat Standard Oil. After the agreement fell apart, the disorganized producers lost all incentive to curtail production, feeding another downward spiral in oil prices.

By 1873, Standard Oil was shipping about a million barrels of refined oil per year and earning about a dollar a barrel, yet the business remained on an unsure footing. Rockefeller had clarified one thing in his own mind, however: Voluntary associations couldn't move with the speed, unity, and efficiency he wanted. "We proved that the producers' and refiners' associations were ropes of sand," he said.<sup>7</sup> He was now through with ineffectual alliances and ready to bring the industry to heel under Standard Oil control. "The idea was mine. The idea was persisted in, too, in spite of the opposition of some who became fainthearted at the magnitude of the undertaking, as it constantly assumed larger proportions."<sup>8</sup> By early 1873, he had crossed his own Rubicon and never looked back. Once embarked on a course of action, he wasn't a man to be hobbled by doubts.

In 1873, the mad dash for riches that followed the Civil War ended in a prolonged slump that ground on for six interminable years. On Black Thursday—September 18, 1873—the august banking house of Jay Cooke and Company failed because of problems in financing the Northern Pacific Railway. This event ignited a panic, leading to a stock-exchange shutdown, a string of bank failures, and widespread railroad bankruptcies. During the next few years, deflated by massive unemployment, daily wages plunged 25 percent, exposing many Americans to the horror of downward mobility. The six lean years accelerated the process of consolidation that had gathered force in many economic sectors.

This depression especially exacerbated the problems of the oil industry. Soon after Black Thursday, crude prices touched a shocking low of eighty cents a barrel; within a year, prices had tumbled to forty-eight cents—cheaper than the cost of hauling water in some towns. Just as Carnegie expanded his steel operations after the 1873 panic, so Rockefeller saw the slump as a chance to translate his master blueprint into reality. To capitalize on rival companies selling at distress-sale prices, he slashed Standard Oil's dividend to increase its cash reserves. Standard Oil weathered the six-year depression magnificently, a fact Rockefeller attributed to its conservative financial policy and unparalleled access to bank credit and investor cash.

The oil-refining industry staggered under so much surplus capacity that even Standard Oil, comprising a quarter of the industry, operated only two of its six main Cleveland plants. For all that, it managed to post such creditable profits that it sometimes wooed competitors simply by giving them a privileged peek at its books. Rockefeller was acquiring unstoppable momentum and, having subdued Cleveland, he soon began his march from city to city in an unrelenting campaign of national consolidation.

As his operations grew, Rockefeller made a fetish of secrecy, flavored with paranoia, a legacy of his self-conscious boyhood. One day, he saw an office employee talking to a stranger and later inquired after the man's identity. Although the subordinate said the man was a friend, Rockefeller lectured him, "Well, be very careful what you say. What does he want here? Don't let him find out anything." "But he is just a friend," the employee replied. "He doesn't want to know anything. He has just come to see me." "Quite so," said Rockefeller, "but you can never tell. Be careful, be very careful."<sup>9</sup>

In absorbing competitors, Rockefeller was equally secretive and asked them to continue operating under their original names and not divulge their Standard Oil ownership. They were instructed to retain their original stationery, keep secret accounts, and not allude on paper to their Cleveland connection; internal correspondence with Standard Oil was often conducted in code or with fictitious names. Rockefeller also did this as a necessary legal expedient, for under existing law Standard Oil of Ohio couldn't own property outside the state, a situation that invited deception by companies that operated nationally.

Rockefeller warned refiners joining Standard Oil not to parade their sudden wealth, lest people wonder where they got the cash. After striking a deal with one Cleveland refiner, he invited him to his Euclid Avenue home one night and said: "But you must keep this contract secret even from your wife. When you begin to make more money, don't let anybody know it. Don't put on any more style. You have no ambition to drive fast horses, have you?"<sup>10</sup> With such thoroughgoing stealth, Standard Oil executives worried that if some newly acquired refiner died, his heirs might mistakenly claim ownership of the refinery.

Rockefeller was similarly suspicious of any boasting or ostentation among associates. One day, he was riding on a train in Cleveland with Pittsburgh refiner O. T. Waring when Waring asked him who owned a handsome, dark green hillside house in the distance. "You wish to know who owns that house?" asked Rockefeller, suddenly very upset. "It's our Mr. Hopper, who makes barrels for us. Whew! It's an expensive house, isn't it? I wonder if Hopper isn't making altogether too much money? Let's look into it."<sup>11</sup> Back in the office, he pored over the accounts, decided that Hopper's profits were excessive, and terminated the contracts with him. In a similar vein, Rockefeller was concerned that if he advertised his own wealth through fancy houses, he might attract investors into the refining business and only worsen the excess capacity problem.

As will be seen, Rockefeller was capable of extraordinary ferocity in compelling submission from competitors. He might starve out obdurate firms by buying all available barrels on the market or monopolize local tank cars to paralyze their operations. Yet Rockefeller didn't apply this pressure lightly and preferred patience and reason—if possible—to terror. He was not only purchasing refineries but assembling a managerial team. The creation of Standard Oil was often less a matter of stamping out competitors than of seducing them into cooperation. In general, Rockefeller was so eager to retain original management that he accumulated expensive deadwood on the payroll and, for the sake of intraempire harmony, preferred to be conciliatory. Several years later, one colleague wrote to him that almost the entire executive committee "have made up their minds that the policy of buying out our

competitors has had its day and that to pay men salaries for doing nothing is poor business, though these men have been all their active business lives in the Oil business.”<sup>12</sup> This policy, which kept colleagues from defecting and forming competing companies, was one of many expensive extravagances that accompanied the creation of the monopoly.

With access to Oil Creek via the Allegheny River, Pittsburgh was an optimal crossroads for oil traffic, and it was inevitably targeted by Rockefeller for his second great wave of consolidation. After the failed Pittsburgh Plan, Rockefeller hoped to prod, wheedle, and cajole both Pittsburgh and Philadelphia refiners into Standard Oil.

During the autumn of 1874, Rockefeller and Flagler attended a secret summit meeting in Saratoga Springs with their Pittsburgh and Philadelphia counterparts, Charles Lockhart and William G. Warden. By snapping up the strongest refiners in these two towns, Standard Oil hoped that it would then easily corral the smaller refiners in their wake. With its racetrack and gambling casino, Saratoga Springs was a fashionable resort for wealthy sportsmen and, as Commodore Vanderbilt’s summer home, a popular gathering spot for confidential business talks. After breakfast, the four refiners retreated to a pleasant pavilion by a spring, where they talked for six hours. Only by banding together in one firm, Rockefeller argued in his most soothing manner, could they avert destructive price-cutting. When Lockhart and Warden hesitated, Rockefeller played his trump card: He invited Warden to come to Cleveland and inspect the Standard Oil books. When Warden later examined them, he was taken aback: Rockefeller could manufacture kerosene so inexpensively that he could sell below Warden’s production costs and earn a profit. After several weeks of appraising Standard Oil and being assured of a voice in its management, Warden and Lockhart joined forces with Rockefeller. In the clandestine sale of their plants, they had the foresight to take payment in Standard Oil stock. Since Rockefeller’s papers from this period are sparse, we don’t know precisely why these powerful rivals yielded to him, but they were probably attracted by the access to railroad rebates, lower interest rates, scarce tank cars, and technical expertise that went along with the partnership.

With this decisive stroke, Rockefeller absorbed more than half of the Pittsburgh refining capacity, with the leading Philadelphia refinery tossed in for good measure. In this way, he activated a self-sustaining movement as his new allies agreed to consolidate business in their localities and supervise the purchase of the remaining independent refineries. A massive chain reaction was thus set in motion that rippled through both refining centers, with local businessmen now acting as Rockefeller’s agents. Of twenty-two Pittsburgh refiners in existence when Rockefeller struck his Saratoga Springs deal, only one was still in existence independently two years later.

Rockefeller was especially delighted to snare Charles Lockhart, a bearded Scot with a frosty, taciturn manner who was, in Rockefeller’s words, “one of the most experienced, self-contained, and self-controlled men in business.”<sup>13</sup> During the Saratoga meeting, he impressed the Standard men because he listened attentively but hardly breathed a syllable, which elicited Rockefeller’s highest praise: “That’s the kind of man I’d like to have go fishing with me.”<sup>14</sup> Though the oil business was comparatively young, Lockhart was already a veteran, having sold Seneca Oil along with William Frew in a Pittsburgh store in the 1850s. Soon after Edwin Drake’s discovery, Lockhart had carried the first samples of Pennsylvania kerosene to London. Besides creating the top Pittsburgh refiner, Lockhart, Frew and Company, the two men had also joined forces with William Warden to establish a Philadelphia affiliate, Warden, Frew and Company, which later evolved into the Atlantic Refining Company. This innovative trio of refiners shipped oil to Liverpool aboard steamers lined with iron tanks, reducing both the risk of fire and the noisome smells. The antithesis of the penurious Lockhart, Warden was an effusive, bighearted man with a broad face and muttonchop whiskers. With wider-ranging interests than the average Standard Oil man, he was a former abolitionist who had donated money to black causes after the war, a conscientious Presbyterian, and an active reformer in Philadelphia politics.

While stepping up his Pittsburgh and Philadelphia campaigns, Rockefeller also established a critical foothold in New York, where he had already bought the Devoe Manufacturing Company, specialists in case oil, and the Long Island Company, operator of a large refinery. Through the efforts of brother William, Rockefeller now took over Charles Pratt and Company. A short man with a sandy beard, Charles Pratt was a self-made Baptist with the habitual reticence that Rockefeller prized. He had manufactured paints before the Civil War and this had led him into oil refining. With a flair for merchandising, he had made his high-quality kerosene, Astral Oil, a common fixture in American households and so adroitly managed exports to Europe and Asia that the brand acquired international fame.

In time, Charles Pratt felt slighted and pushed aside by Rockefeller, who sometimes admired his conservative style but generally mocked him as an old fogey lacking in vision. Quite unlike Warden and Lockhart, Pratt ended up on the losing side of many policy disputes with Rockefeller and took to writing him querulous letters laced with self-pity. During one squabble with Rockefeller in 1881, Pratt wrote petulantly, “I cannot see good in any effort of mine to influence you or others by any arguments.”<sup>15</sup>

The undisclosed purchase of Charles Pratt’s firm brought into the Standard fold one of the most energetic, swaggering figures in its history: Henry H. Rogers, who had led the committee of New York refiners that indignantly contested the SIC. He was now one of the first turncoats who defected to the Standard camp, and Rockefeller gloated over such conquests. “I’m happy to state that in most cases the very men who were desperately opposed to anything the Standard Oil Company might suggest . . . when they met us face to face, when they came to know from us rather than from those maligners, they readily joined us and never had occasion to regret.”<sup>16</sup> Though he later clashed with Rockefeller, Rogers was a versatile executive who directed, in turn, Standard’s crude-oil purchases, pipelines, and manufacturing operations. As petroleum by-products grew in importance, Rogers, with a technical grasp that exceeded Rockefeller’s, patented a landmark process for separating naphtha from crude oil.

No sooner had Standard Oil enlisted Charles Pratt than New York independents began to experience unaccountable shortages of vital supplies. John Ellis and Company, which manufactured petroleum jelly, suddenly found it couldn’t book the requisite railroad cars for crude-oil shipments. Some invisible force was working against them. As the firm tried to unravel this mystery, a Standard Oil representative took the opportunity to drop by for a friendly chat with John Ellis and warned him, “You are helpless. You will have to sell out.” Appalled by this heavy-handed treatment, Ellis retorted, “I will never sell out to any company as crooked as the Standard Oil.”<sup>17</sup> Ellis stayed independent, but few firms had the resources or fortitude to withstand the unceasing pressure exerted by the growing legions of Standard Oil minions.

In his lightning offensives in Pittsburgh, Philadelphia, and New York, Rockefeller was buying refineries in strategic railroad and shipping hubs,

where he could negotiate excellent transportation rates. But despite its proximity to the wells, he never considered Oil Creek an economical place for refineries—which didn’t enhance his popularity in western Pennsylvania. Many ingredients used in refining—from sulfuric acid to glue to barrel hoops—cost more in that secluded area than in urban centers. By demoting the Oil Regions as a refining center, Rockefeller threatened the livelihood of thousands of people in Titusville, Franklin, and Oil City and offended their sense of justice. The locals were taught to believe, in Rockefeller’s words, that “the place where the oil was produced, gave certain rights and privileges that persons seeking to engage in other localities had no right to presume to share.”<sup>18</sup> Rockefeller struck them as an evil interloper, a usurper of their birthright, when he was merely exercising his right to practice business where he pleased.

Nonetheless, to enforce an airtight monopoly, he needed to capture the Oil Creek refineries, if only to dismantle the least efficient ones. On January 22, 1874, he stunned local refiners by buying the Imperial Refining Company and its vast facility near Oil City. For local anti-Standard firebrands, it was a move laden with ominous symbolism. One of the consenting sellers was Captain Jacob J. Vandergrift, a husky little man with a Santa Claus beard. A former skipper on the Ohio River, Vandergrift was a wealthy, God-fearing temperance advocate who commanded universal power and respect. Along Oil Creek, his desertion to Standard Oil was considered treasonous betrayal, and it demoralized local independents—precisely what Rockefeller had wanted. In early 1875, Rockefeller captured the second largest Titusville refiner, Porter, More-land and Company, which brought twenty-seven-year-old John D. Archbold—the diminutive homilist who had electrified the crowd at the Titusville Opera House with his blazing oratory against the SIC—into the Standard Oil fold. Now, convinced that competition was a dated concept, Archbold suddenly enlisted under the banner of industrial consolidation.

Aside from Henry Flagler, Archbold was the most significant figure recruited by Rockefeller. Even before he set eyes on him, Rockefeller was intrigued. Registering at a Titusville hotel one day, he noted the signature above his own name: “John D. Archbold, \$4 a barrel.” This cocky self-promotion impressed Rockefeller, for crude oil was selling at substantially below that price.<sup>19</sup> Nine years younger than Rockefeller, the boyish Archbold was a short spark plug of a man, weighing about 130 pounds. The son of a Baptist circuit preacher who abandoned his family when John was ten (the prevalence of ministers’ sons at Standard Oil is striking), he had come to Titusville as a teenager and grown up with the industry. Quick-witted and optimistic, a jovial raconteur, he “laughed his way to a great fortune,” as one contemporary said.<sup>20</sup> Though not easily charmed, Rockefeller was enchanted by Archbold’s high spirits, his inexhaustible fountain of jokes and stories; his short stature aside, he was the man at Standard Oil who most resembled Big Bill. Archbold became Rockefeller’s proxy, picked successor, surrogate son, and court jester. Before long, Rockefeller learned that this preacher’s son was overly fond of worldly pleasure and spent his nights drinking and playing poker. In time, Rockefeller forced him to repudiate alcohol, but even this only seemed to draw them closer together.

When Archbold went over to Standard Oil, he was denounced bitterly as a “renegade” and “deserter” and incurred special resentment from former admirers.<sup>21</sup> He was such a deft, good-natured diplomat, however, that Rockefeller assigned him to absorb the Oil Creek refiners. In no other place did Rockefeller so sorely need an attractive substitute. Around Titusville, Standard Oil was reviled as the “octopus,” and Rockefeller was regarded as a monster. Mothers scolded their children by saying, “Run, children, or Rockefeller’ll get you!”<sup>22</sup> As a result, the original Standard Oil officials never conducted buyout talks directly but operated through “acquaintances, competitors, and friends of the competitive refiners, best calculated to explain to them the situation, best fitted to succeed in the negotiations because of their intimate acquaintance, kindly relations and the mutual confidence of neighbors and friends.”<sup>23</sup> Archbold was the smiling face who mollified enemies and restored peace, and with his advent Rockefeller no longer needed to go to Oil Creek.

In September 1875, Standard Oil formed the Acme Oil Company, a front organization to take over local refiners under Archbold’s guidance. Within months, he had bought or leased twenty-seven refineries, moving at such a hectic pace that he nearly drove himself to collapse. Over the next three or four years, Archbold herded the remaining independents into Standard Oil. Several letters from Archbold to Rockefeller confirm the latter’s contention that he paid fairly for refiners. After grudgingly paying an exorbitant \$12,000 for one refinery, Archbold told Rockefeller, “We have the feeling that it is a large price for the property and do not doubt but that if we could hold out for a time on the present low basis we might do better, but whether the difference is worth the ammunition is a question.”<sup>24</sup> Once the purchase was settled, he added, “I found it a very difficult trade to make, & was compelled to make some concessions to the parties that I disliked very much to make regarding which I will explain to you more fully when I see you.”<sup>25</sup> Though independent refiners often felt squeezed by Rockefeller, he didn’t always exploit their vulnerability to the maximum possible extent and sometimes even showed leniency.

At least one prominent refiner contended that he was subjected to coercion by Standard Oil when he tried to build a new refinery. Samuel Van Syckel, the pipeline pioneer, said a Standard Oil representative had offered him a good salary to abandon the project. “He then said that I could make no money if I did refine oil. He also said if I did I could not ship it. He said he would say to me confidentially that they had made such arrangements with the railroads in reference to freight—in reference to getting cars—he knew I could make no money if I did make oil.”<sup>26</sup> Van Syckel bowed to superior force.

In May 1875, Rockefeller completed his grand design of controlling all the major refining centers when he covertly bought J. N. Camden and Company of Parkersburg, West Virginia, and rechristened it the Camden Consolidated Oil Company. Camden’s correspondence documents the stealth involved in this sort of takeover. Before consummating the sale, Standard Oil requested a minute inventory of his properties and was ready to send its expert superintendent, Ambrose McGregor, to investigate. Yet Johnson Newlon Camden himself, a well-known Democratic politician, feared that the superintendent of his barrel factory might recognize McGregor and warned Standard Oil, “We would prefer having him to come here, but don’t see how he could do it without exposing the whole thing. I find the Superintendent of the Barrel Factory is a little curious about what is going on.”<sup>27</sup> That even a superintendent was kept in the dark about the new owners underscores the priority that Standard Oil placed on confidentiality.

The Camden deal remedied a flagrant weakness for Rockefeller, who dominated refineries in the areas served by the New York Central, the Erie, and the Pennsylvania Railroads. There was only one gaping hole left in the map: the territory controlled by the maverick Baltimore and Ohio (B&O) Railroad, whose tracks spanned southern Pennsylvania, connecting a cluster of refineries in Parkersburg and Wheeling, West Virginia, with an oil-export center in Baltimore. Even more intolerable for Rockefeller, the upstart B&O dared to handle crude oil shipped to Pittsburgh through a pipeline called the Columbia Conduit Company, which had defied Standard Oil at every turn. In short, the B&O was providing comfort to the last independent

refiners still holding out in open rebellion against his imperial rule.

The president of the B&O, John W. Garrett, had long exhorted Camden to fight the Standard Goliath and offered him marked-down freight rates to do so. Now that he had—unbeknownst to Garrett—defected to Rockefeller, Camden wanted to retain the rates expressly designed to shore up Standard Oil opponents. On May 12, 1875, scarcely able to suppress his mischievous glee, Camden informed his new owners in Cleveland, “Mr. Garrett . . . is coming out to see us tomorrow. I suppose he will encourage us to keep up our oil business and fight the ‘combination’ ”—that is, Standard Oil.<sup>28</sup> And he negotiated excellent rates with Garrett. In exchange for shipping fifty thousand barrels of oil monthly, he would receive a ten-cent-a-barrel drawback on *all* refined oil sent via the B&O—whether shipped by Camden or by his competitors. That Garrett revived the infamous drawback when he thought he was *fighting* Standard Oil shows that nobody could claim exclusive virtue in this business.

That spring, Rockefeller gave Camden wide leeway to buy up refiners serviced by the B&O, and he quickly snatched up three Parkersburg refiners. At several points, Camden, like Archbold, bristled at the excessive prices he paid. “It almost makes me weepy to pay out good money for this kind of junk,” he told Rockefeller, “but as it is a part of our duty to mankind, I suppose it is necessary to carry it through without flinching.”<sup>29</sup> The completion of the Baltimore campaign left John D. Rockefeller, still in his thirties, the sole master of American oil refining. Since no major crude-oil deposits had been unearthed beyond western Pennsylvania—Russia, perhaps, being the lone exception—it also meant that he monopolized the world kerosene market. He was now living a fantasy of extravagant wealth that would have dwarfed the most febrile daydreams of William Avery Rockefeller. And few people beyond the oil business had ever even heard of him.

The swift raids on the principal refining centers cost such a king’s ransom that Rockefeller’s most ticklish problem was how to bankroll this marathon buying spree. To entice refiners, he offered them the option of taking payment either in cash or stock, and he always dreaded the choice of cash. “I would whip out our check book with rather a lordly air and remark, as if it were a matter of entire indifference to us, ‘Will I write a check or would you prefer payment in Standard Oil shares?’ ”<sup>30</sup> If they chose cash, he often had to scramble among banks to scrounge up money. By encouraging opponents to take stock, he conserved funds and also enlisted the allegiance of quondam foes in his burgeoning enterprise. But few companies followed the lead of Clark, Payne and invested in Standard Oil instead of taking payment.

It mortified Rockefeller that so few trusting souls took Standard Oil stock. Mostly, they doubted that Rockefeller and his Young Turks could realize their experimental plan. As he recalled, “So when I offered them either spot cash outright for their property or stock in the new company, they took my money and laughed in their sleeves at my folly.”<sup>31</sup> Rockefeller knew, with his customary certitude, that the people who took shares would be enriched. Indeed, American high society in the twentieth century would be loaded with descendants of those refiners who opted for stock. At every opportunity, Rockefeller sounded a prophetic note about the future appreciation of these shares. One Cleveland refiner who took stock later ran into Rockefeller, who asked, “Do you still hold your stock?” When told that was the case, Rockefeller entreated him, “Sell everything you’ve got even to the shirt on your back, but hold on to the stock.”<sup>32</sup> Not all of them did, and Rockefeller always fancied that much of the venom turned against him came from disgruntled refiners who regretted having declined the stock.

Despite his stupendous borrowing needs, Rockefeller no longer needed to truckle to bankers and defied the most fearsome of them all: Amasa Stone. Cold, stern, and unapproachable, Stone amassed a fortune building bridges and railroads and became managing director of the Lake Shore Railroad at the personal behest of Commodore Vanderbilt. Twenty years older than Rockefeller, he expected the refiner to defer to him, and this irked the younger man. To ensure a steady flow of credit, Rockefeller put Stone on Standard’s board, but when the latter grew arbitrary and domineering, Rockefeller plotted to banish him. He soon had his chance when Stone inadvertently let an option expire for buying more Standard Oil stock. Several weeks later, recognizing his error, Stone showed up at the Standard office and induced Flagler to extend the expiration date. Itching for a showdown, Rockefeller overrode Flagler and refused to sell Stone any more shares, prompting the irate banker to liquidate his stake in the company. Rockefeller now considered himself the equal of any Cleveland businessman and wouldn’t grovel to anyone.

Just as he dreamed of emancipation from his bankers, Rockefeller hoped to escape the clutches of Vanderbilt, Gould, Scott, and other railroad barons. Early on, he had demonstrated the edge possessed by large-scale shippers in haggling with railroads. Now, he went a critical step further, figuring out how to insinuate himself into the very infrastructure of the industry.

Still uneasy at the specter of the oil fields drying up, the railroads shrank from investments in custom-made facilities for handling oil, worried that this specialized equipment might someday be rendered worthless. Exploiting this fear, Rockefeller worked out a clever bargain with the Erie Railroad in April 1874. The railroad would transfer control of its Weehawken, New Jersey, terminal to Standard Oil if Standard met two conditions: First, it would have to outfit the rail yards with modern apparatuses that would help to expedite oil shipments to New England and the South; second, it would have to ship 50 percent of its western refinery output over Erie tracks. For Rockefeller, the arrangement promised multiple advantages, for he not only received preferential rates from Erie but could also chart the oil movements of competitors across the country. He could even block the export of rivals’ oil—an option that, having made this huge investment, he freely exercised. As he argued, “I know of no parallel case in other branches of business where the competitor felt injured because he could not use his rival’s capital and facilities for his own advantage and the disadvantage of the owner of the capital and facilities.”<sup>33</sup> Rockefeller’s logic was unimpeachable—unless one accepted the still controversial proposition that railroads were common carriers and should deal with all shippers impartially.

Rockefeller was embraced no less warmly by the New York Central, which was controlled by the Vanderbilt family. Commodore Vanderbilt reportedly said that Rockefeller was the one man in America who could dictate terms to him; meanwhile, his son, William H. Vanderbilt, discreetly purchased Standard Oil stock for his own account.<sup>34</sup> It was the younger Vanderbilt who said presciently of Rockefeller in the 1870s: “He will become the richest man in the country,” thus inheriting the title from his father.<sup>35</sup> Standard Oil eventually became so enmeshed in the railroad business that it controlled virtually all the oil traffic that traveled over the Erie and the New York Central tracks.

Standard Oil also profited immeasurably from the revolution in oil transport as barrels gave way to tank cars. As Rockefeller later testified, “We soon discovered as the business grew that the primary method of transporting oil in barrels could not last. The package often cost more than the contents,

and the forests of the country were not sufficient to supply the necessary material for an extended length of time.”<sup>36</sup> Once again, the railroads balked at investing in rolling stock that couldn’t also transport general freight, so Rockefeller stepped boldly into the breach. In 1874, Standard Oil—with that kindly solicitude for the railroads’ welfare that artfully tied them up with myriad strings—began to raise tens of thousands of dollars to build oil-tank cars, which they would then lease to the roads for a special mileage allowance. Decades later, Armour and Company, the Chicago butcher, mimicked the same strategy by buying up refrigerator cars.

As the owner of almost all the Erie and New York Central tank cars, Standard Oil’s position grew unassailable: At a moment’s notice, it could crush either railroad by threatening to withdraw its tank cars. It also prodded the railroads into granting favors for tank cars not enjoyed by the small refiners who shipped by barrel. For instance, railroads levied a charge for the return of empty barrels, while tank cars traveled free on the return route from the East Coast to the Midwest refineries. Tank-car clients also received the exact same leakage allowance received by barrel shippers, even though the tank cars didn’t leak—which effectively allowed Standard Oil to carry sixty-two gallons gratis in every tank car.

In this impregnable position, Rockefeller fulfilled a longtime wish and abolished forever the freight advantage of the Oil Creek refiners. In high-level talks with railway officials at Long Branch, New Jersey, and Saratoga Springs in the summer of 1874, he made them equalize rates for all refiners shipping to the East Coast. Crude oil would now effectively travel free on the 150-mile stretch between Oil Creek and Cleveland, destroying the advantage of owning a refinery in the oil fields and creating parity for Cleveland. When this shocking news surfaced in the so-called Rutter Circular of September 9, 1874, it sparked mass meetings and howls of protest along Oil Creek, where Rockefeller was universally execrated. Unlike the situation with the SIC, the railroads didn’t tremble at the uproar but reacted with cool intransigence, knowing the independent refiners were now doomed. Three weeks passed before A. J. Cassatt of the Pennsylvania Railroad issued a curt, unrepentant letter in defense of the new uniform rates. For a long time, the independents had fought a valiantly unequal contest with Standard Oil, but now that the railroads had fallen under Standard’s spell, the contest was over.

Had oil been found in scattered places after the Civil War, it’s unlikely that even Standard Oil could have mustered the resources to control it so thoroughly. It was the confinement of oil to a desolate corner of northwest Pennsylvania that made it susceptible to monopoly control, especially with the emergence of pipelines. Pipelines unified the Pennsylvania wells into a single network and ultimately permitted Standard Oil to start or stop the flow of oil with the turn of a spigot. In time, they relegated collaboration with the railroads into something of a sideshow for Rockefeller.

Only belatedly did Rockefeller discern the full potential of pipelines, and his entry into the business seemed somewhat of a defensive, rearguard action. He knew that the railroads felt threatened by the pipelines, and for a time he thought it worthwhile to help them safeguard their interests by delaying the introduction of this new technology. Then, one of the railroads forced him to modify his plans. During the summer of 1873, he was taken aback when the Pennsylvania Railroad expanded into pipelines through an aggressive, fast-freight subsidiary known as the Empire Transportation Company, which integrated two of the largest Oil Creek pipelines into its railroad network. Thus far, pipelines had only pumped oil short distances from the wellhead to the railroads, but this move presaged a time when pipelines would span great distances and supplant railroads altogether. Even worse from Rockefeller’s viewpoint, Empire seemed the harbinger of a pipeline monopoly under the thumb of his rival and sometime coconspirator Tom Scott of the Pennsylvania Railroad. Rockefeller’s paranoia was fully justified. In the perpetual game of shifting alliances, Tom Scott had made his tactical compromises with Rockefeller, but he generally feared Standard Oil and sought to shatter its refining monopoly, presumably to replace it with his own.

In a deft countermove, Rockefeller called upon Daniel O’Day, one of the most colorful figures in Standard history, to lay down a pipeline system. Born in County Clare, O’Day was a profane, two-fisted Irishman who tempered ruthless tactics with wit and charm. He inspired loyalty among subordinates and raw terror among adversaries. On his forehead O’Day bore a scar from an old Oil Creek brawl that was a constant reminder of his bare-knuckled approach to business. In 1874, under O’Day’s tutelage, Standard launched the American Transfer Company to construct a pipeline network. Jockeying for position, Rockefeller also acquired a one-third interest in Vandergrift and Forman, controlled by Jacob J. Vandergrift, the steamboat captain who had merged his refining interests with Standard Oil. The Vandergrift pipelines formed the core of a new venture, the United Pipe Lines, that pretended to be free of Standard Oil control. By giving small stakes in United to William H. Vanderbilt of the New York Central and Amasa Stone of the Lake Shore, Rockefeller tightened his grip over friendly railroads. This set him up to extract maximum advantage from both the railroads and pipelines so long as these two means of transport coexisted in the oil business. When the owners of the first pipeline systems established a pool to set rates and allocate quotas among putatively competing networks in the summer of 1874, Rockefeller’s pipelines gained an impressive 36 percent market share.

Between American Transfer and United Pipe Lines, Rockefeller now sat astride nearly a third of the crude oil flowing from Oil Creek wells. Henceforth, Standard’s influence in petroleum transport would be no less pervasive and even more profitable than its unmatched position in refining. This power offered many temptations for abuse. An oilman could make a tremendous strike and suddenly feel fabulously rich, but if he couldn’t hook up the gushing black liquid to a pipeline, it was worthless. The drillers had always credited Rockefeller with a life-and-death hold over them, and as the Standard Oil pipelines encroached upon the oil fields, snaking across the slopes of Oil Creek, that power took on a frighteningly tangible form.

## CHAPTER 10

### Sphinx

In April 1874, as befitted the status of this new oil colossus, Standard Oil moved into a new four-story building that Rockefeller and Harkness had erected at 43 Euclid Avenue, east of the Public Square. Behind a heavy stone façade, the two Standard Oil floors were roomy and airy, drawing extra light from a skylight above the central stairway. Every morning at 9:15 sharp, Rockefeller arrived, elegantly attired, with the letter *R* neatly incised in his black onyx cuff links; for someone from a frugal, rural background, he was unexpectedly fastidious. “Mr. Rockefeller came in with an air of calm dignity,” recalled one clerk. “He was immaculately dressed—he looked as if he had been turned out of a bandbox. He carried an umbrella and his gloves, and wore a high silk hat.”<sup>1</sup> He placed such faith in polished shoes that he provided, free of charge, a shoe-shining kit for each office unit. Tall and pale, with neatly trimmed reddish gold side-whiskers, he had a barber shave him each morning at the same hour. Extremely punctual for all appointments, he said, “A man has no right to occupy another man’s time unnecessarily.”<sup>2</sup>

In his imperturbable style, Rockefeller quietly bid his colleagues good morning, inquired after their health, then vanished into his modest office. Even within the Standard Oil kingdom, his employees found his movements as wraithlike as his most paranoid Titusville antagonists did. As one secretary remarked, “He is sly. I never have seen him enter the building or leave it.”<sup>3</sup> “He’s never there, and yet he’s always there,” echoed an associate.<sup>4</sup> Rockefeller seldom granted appointments to strangers and preferred to be approached in writing. Ever alert against industrial espionage, he never wanted people to know more than was required and warned one colleague, “I would be very careful about putting [someone] into a position where he could learn about our business and be troublesome to us.”<sup>5</sup> Even close associates found him inscrutable and loath to reveal his thoughts. As one wrote, “His long silences, so that we could not locate even his objections, were sometimes baffling.”<sup>6</sup> Schooled in secrecy, he trained his face to be a stony mask so that when underlings brought him telegrams, they couldn’t tell from his expression whether the news was favorable or not.

Rockefeller equated silence with strength: Weak men had loose tongues and blabbed to reporters, while prudent businessmen kept their own counsel. Two of his most cherished maxims were “Success comes from keeping the ears open and the mouth closed” and “A man of words and not of deeds is like a garden full of weeds.”<sup>7</sup> Big Bill’s deaf-and-dumb routine curiously prefigured his son’s habit of hearing as much as possible and saying as little as possible to gain a tactical edge. When bargaining, he employed his Midwest taciturnity to effect, throwing people off stride and keeping them guessing. When angry, he tended to grow eerily quiet. He liked to tell how a blustering contractor stormed into his office and launched into a snarling tirade against him while he sat hunched over his writing desk and didn’t look up until the man had exhausted himself. Then, spinning about in his swivel chair, he looked up and coolly asked, “I didn’t catch what you were saying. Would you mind repeating that?”<sup>8</sup>

Much of the time, he was closeted in his office, where he had oil prices chalked on a blackboard. He paced this spartan office, hands laced behind his back. Periodically, he emerged from his lair, mounted a high stool, and studied ledgers, scribbling calculations on pad and paper. (During meetings, he was a restless doodler and note taker.) Frequently, he stared out the window, motionless as an idol, gazing at the sky for fifteen minutes at a stretch. He once asked rhetorically, “Do not many of us who fail to achieve big things . . . fail because we lack concentration—the art of concentrating the mind on the thing to be done at the proper time and to the exclusion of everything else?”<sup>9</sup>

Rockefeller adhered to a fixed schedule, moving through the day in a frictionless manner. He never wasted time on frivolities. Even his daily breaks—the midmorning snack of crackers and milk and the postprandial nap—were designed to conserve energy and help him to strike an ideal balance between his physical and mental forces. As he remarked, “It is not good to keep all the forces at tension all the time.”<sup>10</sup>

In the early days, Rockefeller knew the name and face of each employee and occasionally perambulated about the office. He walked with a measured gait, steady as a metronome, always covering the same distance in the exact same time. He had the soundless movements and modulated voice of an undertaker. Gliding about with silent footfalls, he startled people by materializing at their desks and politely asking, in a mellow voice, to inspect their work. Since he was seldom seen, people often wondered about his whereabouts. “His was the least known face in the offices,” one employee recalled fifty years later, still perplexed about Rockefeller’s daily schedule. “He was reported to inhabit them three hours a day, but his appearances and disappearances were curtained, suggested private approaches, withdrawn stairways and corridors.”<sup>11</sup>

*A photograph of John D. Rockefeller that clearly shows his keen determination as a young businessman. (Courtesy of the Rockefeller Archive Center)*

As a former bookkeeper, Rockefeller devoted special attention to ledgers. One accountant recalled him stopping by his desk and saying courteously, “Permit me,” then flipping quickly through his books. “Very well kept,” he said, “very, indeed.” Then his eye leaped to a tiny error. “A little error here; will you correct it?” The accountant was flabbergasted by the speed with which Rockefeller had scanned so many dense columns of figures. “And I will take my oath,” he reported, “that it was the only error in the book!”<sup>12</sup>

Everybody noted the man’s preternatural calm. Though he had honed his will into a perfect instrument, he was even-tempered by nature. As he remarked, “You could do or say the most outrageous thing at this moment and I would not show the least sign of excitement.”<sup>13</sup> He was always proud of the fact that he had an abnormally low pulse of fifty-two. Many employees said he never lost his temper, raised his voice, uttered a profane or slang word, or acted discourteously. He defied many stereotypes of the overbearing tycoon and generally received excellent reviews from employees who regarded him as fair and benevolent, free of petty temper and dictatorial airs. This was nicely illustrated by an anecdote. As a fitness buff, Rockefeller placed in the accounting department a wood-and-rubber contrivance that he pushed and pulled for exercise. When he showed up one morning for exercise, a junior accountant didn’t recognize him, called the gadget a damned nuisance, and demanded that it be carted off. “All right,” said Rockefeller and had the contraption removed. Somewhat later, to his horror, the young man realized that he had berated the chief executive, yet he never endured one word of reprimand. Rockefeller even hesitated to punish serious offenses and instead of prosecuting the occasional embezzler simply dismissed him.

Throughout his life, Rockefeller was wounded deeply by accusations that he was a cold, malignant personality. In truth, like many retiring personalities, he provoked varied reactions in people. One cooper who sold him barrels in the early days told Ida Tarbell that “Rockefeller was never a great talker; that he was not liked by his fellows; that everybody was afraid of him; and that he was solitary.”<sup>14</sup> But Rockefeller never turned the ferocity that he trained against rivals against his own employees and people who worked for him usually found him a model of propriety and paternalistic concern. As one refinery worker remembered him, “He always had a nod and a kind word for everybody. He never forgot anyone. We had some trying times in the business in those early years, but I’ve never seen Mr. Rockefeller when he was not friendly and kind and unruffled. Nothing excited him.”<sup>15</sup> Rockefeller’s sister Mary Ann dismissed as an absurd canard the idea that he was a curmudgeon. “John could always get along so easily with anyone,” she declared.<sup>16</sup> Indeed, had he not possessed some charm, or at least cordiality, he could never have accomplished so much in the business world.

So highly did Rockefeller value personnel that during the first years of Standard Oil he personally attended to routine hiring matters. (After conquering the other refining centers, the payroll ballooned to 3,000 people, and this became impossible.) Taking for granted the growth of his empire, he hired talented people as found, not as needed.

Far more than a technocrat, Rockefeller was an inspirational leader who exerted a magnetic power over workers and especially prized executives with social skills. “The ability to deal with people is as purchasable a commodity as sugar or coffee,” he once said, “and I pay more for that ability than for any other under the sun.”<sup>17</sup>

Employees were invited to send complaints or suggestions directly to him, and he always took an interest in their affairs. His correspondence is replete with inquiries about sick or retired employees. Reasonably generous in wages, salaries, and pensions, he paid somewhat above the industry average. Forty years later, a former subordinate wrote of the firm, with some exaggeration, “It has never had a strike or a dissatisfied workman; and today no business organization cares for its veterans in their old age as does the Standard Oil Company.”<sup>18</sup> It is important to point out that oil refining was a capital-intensive industry without the seething discontents that afflicted the coal mines or steel mills. Even in lean years, Standard Oil was flush with profits, permitting it the luxury of good intentions. One biographer has gone so far as to say of Rockefeller, “He was the best employer of his time, instituting hospitalization and retirement pensions.”<sup>19</sup>

He was a fine boss if workers abided by his rules, but if they did something foolish, like show interest in a union, they promptly forfeited his sympathy. Rockefeller never acknowledged the legitimacy of organized labor, nor did he tolerate union organizers on the premises. He also reserved the right to pass judgment on the private lives of employees. Imposing his own prudish standards on his staff, he penalized any executive implicated in an adulterous affair and frowned on divorce. Sabbath observance was de rigueur, and if colleagues wrote to him when they should have been in church, they tended not to put the real dates on their letters.

The most remarkable instance of Rockefeller participating in an associate’s moral reformation occurred with John D. Archbold, the jovial young protégé whose pranks and infectious laughter so delighted Rockefeller. When Rockefeller initially entreated him to stop drinking, Archbold pretended to abide by the temperance pledge while keeping cloves in his vest pocket to mask telltale smells. By 1881, his drinking binges were too palpable and self-destructive to conceal, and he wrote a contrite letter to Rockefeller, renewing his pledge: “My Dear Mr. Rockefeller—Any words from me seem like a mockery. I give you the promise appreciating its solemnity and importance as I never did before. I will write you the letter every Sunday as long as our relation gives me the privilege, or until you ask me to stop.”<sup>20</sup> Thereafter, every Sunday for eight months, Archbold sent Rockefeller a letter confirming his sobriety that week, writing for instance, “Please let this bear witness to the completion of the 5th period.”<sup>21</sup> Archbold made a sincere effort, but he had at least one violent relapse four years later and felt mortified at having let his mentor down. “I have never before known him to be so thoroughly cast down and in such abject mental misery,” one Standard Oil executive told Rockefeller. “I do not think any one can fully realize the fight he must make against this unfortunate habit, nor the really heartbroken condition he is in after it has come over him.”<sup>22</sup> Aware of Rockefeller’s dismay, other executives tried to make it seem that Archbold had unwittingly swallowed some alcoholic medicine.

His employees tended to revere Rockefeller and vied to please him. As one said, “I have never heard of his equal in getting together a lot of the very best men in one team and inspiring each man to do his best for the enterprise. . . . He was so big, so broad, so patient; I don’t believe a man like him comes to this world oftener than once in five or six hundred years.”<sup>23</sup> Rockefeller worked by subtle hints, doling out praise sparingly to employees and nudging them along. At first, he tested them exhaustively, yet once he trusted them, he bestowed enormous power upon them and didn’t intrude unless something radically misfired. “Often the best way to develop workers—when you are sure they have character and think they have ability—is to take them to a deep place, throw them in and make them sink or swim,” he observed, recalling a method that Big Bill had used with his sons on Owasco Lake. “They will not fail.”<sup>24</sup> To orchestrate such a gigantic operation, he had to delegate authority, and part of the Standard Oil gospel was to train your

subordinate to do your job. As Rockefeller instructed a recruit, “Has anyone given you the law of these offices? No? It is this: nobody does anything if he can get anybody else to do it. . . . As soon as you can, get some one whom you can rely on, train him in the work, sit down, cock up your heels, and think out some way for the Standard Oil to make some money.”<sup>25</sup> True to this policy, Rockefeller tried to extricate himself from the intricate web of administrative details and dedicate more of his time to broad policy decisions.

Most of all, Rockefeller inspired subordinates with his fanatic perfectionism. He never did anything haphazardly and wrote hundreds of thousands of business letters that were models of concision and balanced phrasing, the products of painstaking revision. Dictating letters to his secretary, he went through five or six drafts until he had eliminated every superfluous word and produced precisely the impression desired before affixing his signature with the best penmanship at his command. As one top aide recalled: “I have seen him sign his name to hundreds of papers at a sitting. He did each signature carefully as if this particular one was to be the only one by which he was to be remembered for all time. Each signature became in his mind a work of art.”<sup>26</sup> This passion for excellence originated with Rockefeller and radiated throughout the organization. The ethos of Standard Oil’s operations around the world was John D. Rockefeller’s personality writ large.

While Rockefeller was responsible for policy questions and formulated the theoretical underpinnings of the trust, he didn’t introduce many technical innovations associated with Standard Oil. Rather, he was a matchless executive, an unerring monitor of the stream of proposals channeled to him daily. He had an extraordinary reactive ability, a first-rate power of judgment when presented with options. Perhaps for this reason, he resembles modern chief executives more than he does his domineering industrial contemporaries.

Given the primitive communications and record keeping of the late nineteenth century, Rockefeller couldn’t have managed his decentralized empire without masterfully coordinating a vast array of data. The ledger book enabled him to play the puppeteer and manipulate his empire by invisible strings. By mastering numbers, he reduced the most varied systems to a common standard, and he accepted their harsh verdicts without hesitation. “I charted my course by figures, nothing but figures,” he once said.<sup>27</sup> Mark Hanna disparaged Rockefeller as “a kind of economic super-clerk, the personification of ledger-keeping.”<sup>28</sup> This comment not only overlooks the farsighted nature of Rockefeller’s leadership but discounts the importance of ledger keeping in modern corporations. Numbers gave Rockefeller an objective yardstick to compare his far-flung operations, enabling him to cut through the false claims of subordinates. It was the way that he extended rationality from the top of his organization down to the lowest rung: Every cost in the Standard Oil universe was computed to several decimal places.

Having always shown an aptitude for math, Rockefeller valued this quality in underlings. When he hired his young secretary, George D. Rogers, Rockefeller drew forth a watch to see how fast Rogers could total up a sheet of figures. At the end, Rockefeller said, “Well, you have completed it in the required time,” and then promptly hired the young man, who served him ably for many years. Rogers left some interesting recollections of his boss’s attention to detail and punctilious regard for money. When leaving the office one day, Rockefeller fished in his pockets and realized that he had forgotten his change purse. When he asked to borrow a nickel from Rogers, his assistant volunteered to make a gift of it, but Rockefeller protested. “No, Rogers,” he said, “don’t forget this transaction. This is a whole year’s interest on a dollar.”<sup>29</sup>

Rockefeller attributed much of his success to his quick head for figures. While he was negotiating to buy the long-sought million-dollar Columbia Conduit Company from Dr. David Hostetter, he purposely kept his interlocutor talking for half an hour as he computed the ways the interest could be paid. “When we ended the talk,” Rockefeller said, “he agreed to the terms I offered—and I had saved \$30,000 on the interest by my mental calculations that had never ceased while we were talking.”<sup>30</sup> This episode brought out a subtle vein of anti-Semitism that is intermittently threaded through Rockefeller’s papers. Of his mathematical prowess in outwitting Dr. Hostetter, he boasted, “How well I remember when it helped me to beat a Jew!”<sup>31</sup>

As time went on, Rockefeller had little physical contact with the actual refining, transportation, or marketing of oil—activities that unfolded in dusty outposts of the Standard Oil kingdom—but stayed sequestered in the executive suite, concentrating on finance, personnel, administration, and general policy matters. He downplayed the significance of technical knowledge in business. “I never felt the need of scientific knowledge, have never felt it. A young man who wants to succeed in business does not require chemistry or physics. He can always hire scientists.”<sup>32</sup>

Nevertheless, in the first years of Standard Oil, Rockefeller regularly toured his facilities and was extremely inquisitive and observant, soaking up information and assiduously quizzing plant superintendents. In his pocket, he carried a little red notebook in which he jotted suggestions for improvements and always followed up on them. He knew the terror inspired by that red book. “More than once I have gone to luncheon with a number of our heads of departments and have seen the sweat start out on the foreheads of some of them when that little red notebook was pulled out,” Rockefeller admitted with relish.<sup>33</sup>

With a talent for seeing things anew, Rockefeller could study an operation, break it down into component parts, and devise ways to improve it. In many ways, he anticipated the efficiency studies of engineer Frederick Winslow Taylor. Regarding each plant as infinitely perfectible, he created an atmosphere of ceaseless improvement. Paradoxically, the mammoth scale of operations encouraged close attention to minute detail, for a penny saved in one place might then be multiplied a thousandfold throughout the empire. In the early 1870s, Rockefeller inspected a Standard plant in New York City that filled and sealed five-gallon tin cans of kerosene for export. After watching a machine solder caps to the cans, he asked the resident expert: “How many drops of solder do you use on each can?” “Forty,” the man replied. “Have you ever tried thirty-eight?” Rockefeller asked. “No? Would you mind having some sealed with thirty-eight and let me know?”<sup>34</sup> When thirty-eight drops were applied, a small percentage of cans leaked—but none at thirty-nine. Hence, thirty-nine drops of solder became the new standard instituted at all Standard Oil refineries. “That one drop of solder,” said Rockefeller, still smiling in retirement, “saved \$2,500 the first year; but the export business kept on increasing after that and doubled, quadrupled—became immensely greater than it was then; and the saving has gone steadily along, one drop on each can, and has amounted since to many hundreds of thousands of dollars.”<sup>35</sup>

Rockefeller performed many similar feats, fractionally reducing the length of staves or the width of iron hoops without weakening a barrel’s strength. He was never a foolish penny-pincher, however; for example, he saved on repairs by insisting that Standard build only solid, substantial plants, even if

that meant higher start-up costs. He also tried to use all of the fractions refined from the crude oil. During its first two years, Standard Oil had dealt largely in kerosene and naphtha. Then, in 1874, the company branched out into petroleum by-products, selling paraffin wax for chewing gum and residual oil tar and asphalt for road building. Before long, the company was manufacturing lubricants for railroads and machine shops, as well as candles, dyes, paints, and industrial acids. In 1880, Standard Oil took over the Chesebrough Manufacturing Company in New Jersey in order to strengthen its sales of petroleum jelly.

Ever since his first foray into refining, Rockefeller had relied for technical advice on the ruddy Sam Andrews, who first transmitted to him the technique for cleansing crude oil with sulfuric acid. In 1874, a stiff new competitor to Andrews emerged when Ambrose McGregor was named superintendent of the Standard Oil refineries in Cleveland. Rockefeller was beginning to think Andrews a mediocre man who couldn't keep up with new developments in the field and felt threatened by the more able McGregor.

A man of blinkered vision, Andrews was distressed by Rockefeller's soaring ambition, his constant borrowing and spending. The split between them worsened in August 1878 when Standard declared a 50 percent dividend on its stock. As Andrews later grumbled, "There was plenty of money made to throw that dividend out twice over and make a profit."<sup>36</sup> Though Rockefeller tried to avert clashes with colleagues, nothing nettled him more than directors who preferred fatter dividends to earnings plowed back into the business. One day, Andrews snapped at Rockefeller, "I wish I was out of this business." Calling his bluff, Rockefeller replied, "Sam, you don't seem to have faith in the way this company is operating. What will you take for your holdings?" "I will take one million dollars," Andrews shot back. "Let me have an option on it for twenty-four hours," said Rockefeller, "and we will discuss it tomorrow." When Andrews stopped by the next morning, Rockefeller had a check made out for one million dollars.<sup>37</sup> In truth, Rockefeller was petrified at the thought of Andrews's large stake being sold on the open market, which might have depressed the share price and harmed Standard Oil's credit at a time when he was borrowing heavily against those shares.

At first, Andrews exulted over the sale and was convinced that he had unloaded the stock at a premium. Then Rockefeller turned around and sold the same shares to William H. Vanderbilt for a quick \$300,000 profit.<sup>38</sup> When Andrews loudly cried foul, Rockefeller sent an emissary to tell Andrews that he could buy back his stock at the original sale price. Embittered, Andrews spurned this fair offer and opted to keep the money. Had he kept the stock, it would have been worth \$900 million by the early 1930s, by one estimate.<sup>39</sup> This rash decision, motivated by pure pique and a bruised ego, kept him from becoming one of America's richest men.

Irate at Andrews's behavior, Rockefeller lost whatever residual gratitude he felt for his founding partner and ridiculed his business abilities. Whenever he feuded with someone, he tended to turn that person into a reprobate, and he later said of Andrews, "He was ignorant, conceited, lost his head . . . governed by the same wicked sort of prejudice accompanying the egotism so characteristic of that type of ignorant Englishman."<sup>40</sup> It was one of many times that Rockefeller singled out the English for special abuse. As for Andrews, he not only squandered a chance to make a colossal fortune but later poured the money into an ugly, ornate house on Euclid Avenue where he dreamed of someday entertaining Queen Victoria. Once described as "the most pretentious residence ever built in Cleveland," this five-story monstrosity, with one hundred rooms and as many servants, won the well-deserved nickname of "Andrews's Folly."<sup>41</sup> For the rest of his life, Andrews lambasted Rockefeller in long-winded diatribes to anyone who would listen. Maurice Clark probably caught the truth about Sam Andrews when he said, "Before selling he was sore at John. After selling he was sore at himself."<sup>42</sup> Standard Oil was never kind to skeptics who doubted its bright future.

*The Holy Family*

At a time when America's brand-new millionaires reveled in garish houses that paid queer homage to everything from medieval romance to the Arabian Nights, Rockefeller preferred to own raw land. In 1873, he invested in seventy-nine scenic acres at Forest Hill, a lovely, thickly wooded spot, crisscrossed by steep ravines and gulleys, just four miles east of his Euclid Avenue home. Two years later, he assembled a team of investors who bought the land from him to construct a sanatorium that would specialize in homeopathic medicine and water cures. As part of the deal, Rockefeller and Stephen Harkness set up a short railroad to whisk people out to this suburban resort. When both ventures fell victim to the depression of the 1870s, Rockefeller repurchased the land, now crowned with an enormous rambling building. Starting in 1877, he began to use it as a summer home, perhaps with some therapeutic intention in mind, for the previous year doctors had diagnosed Cettie as consumptive. At the doctors' urging, Rockefeller and his family vacationed in the dry, fresh air of Colorado in the summer of 1876. Perhaps he believed his wife would find relief from the lake breezes at Forest Hill.

Eager to expose Rockefeller as a tasteless vulgarian, Ida Tarbell mocked the Forest Hill house as "a monument of cheap ugliness," and other satirical critics rushed to pile on equally insulting epithets.<sup>1</sup> This much-maligned house was, in fact, John D.'s favorite hideaway. "Oh, I like Forest Hill much better than any other home!" he proclaimed.<sup>2</sup> It enjoyed an excellent location, standing on the brow of a sharply sloping hill, with wonderful views of Lake Erie; it reminded Rockefeller of his boyhood home in Moravia, poised above Owasco Lake. This ungainly Victorian confection was a wilderness of porches and gables, turrets and bay windows, covered with gingerbread detail. Rockefeller loved the large, spacious rooms with their unobstructed views. Fond of light and air, he stripped away the curtains and wall hangings and flooded the house with sunshine, adding a glassed-in porch. He even had a huge pipe organ installed in one parlor.

Those who accurately faulted Rockefeller's taste missed a deeper point, however: At a time when moguls vied to impress people with their possessions, Rockefeller preferred comfort to refinement. His house was bare of hunting trophies, shelves of richly bound but unread books, or other signs of conspicuous consumption. Rockefeller molded his house for his own use, not to awe strangers. As he wrote of the Forest Hill fireplaces in 1877: "I have seen a good many fireplaces here [and] don't think the character of our rooms will warrant going into the expenditures for fancy tiling and all that sort of thing that we find in some of the extravagant houses here. What we want is a sensible, plain arrangement in keeping with our rooms."<sup>3</sup>

It took time for the family to adjust to Forest Hill. The house had been built as a hotel, and it showed: It had an office to the left of the front door, a dining room with small tables straight ahead, upstairs corridors lined with cubicle-sized rooms, and porches wrapped around each floor. The verandas, also decorated in resort style, were cluttered with bamboo furniture. It was perhaps this arrangement that tempted John and Cettie to run Forest Hill as a paying club for friends, and they got a dozen to come and stay during the summer of 1877. This venture proved no less of a debacle than the proposed sanatorium. As "club guests," many visitors expected Cettie to function as their unlikely hostess. Some didn't know they were in a commercial establishment and were shocked upon returning home to receive bills for their stay. The Rockefeller children were no less bemused and disoriented as they found themselves eating in a big dining room, attended by a troop of gentlemanly black waiters. After a year, Rockefeller scrapped this misbegotten venture, fired the waiters, and began to convert the large warren of tiny upstairs rooms into suites and master bedrooms.

From 1877 to 1883, the Rockefellers retained the Euclid Avenue house as their primary residence while spending summers at Forest Hill. Gradually, the stays at Forest Hill lengthened, the estate itself expanding to more than seven hundred acres and the number of employees eventually rising to as high as 136. After a time, the family spent only brief spring and autumn stints at Euclid Avenue. They still went there every Sunday, however, bringing in a cold lunch from Forest Hill when they attended the Euclid Avenue Baptist Church. After late 1883, when the Rockefellers moved to New York, they turned Forest Hill into their exclusive Cleveland residence but never renounced a sentimental attachment to 424 Euclid Avenue. They kept the old house in constant repair, always ready to receive family members, even though they never went there and it slowly lapsed into an honored, deserted monument to bygone days. Plans to turn it into a convalescent home for crippled children or aged couples never materialized. "It seemed too sacred for common use, we all loved it so," Cettie later said.<sup>4</sup>

***Laura Spelman Rockefeller, who seldom wore anything fancier than this dress. (Courtesy of the Rockefeller Archive Center)***

Despite its considerable distance from his office, Rockefeller, clad in goggles and duster, drove downtown each morning from Forest Hill, seated in a little two-seat surrey behind a pair of fast-trotting horses. He was still passionate about trotting horses and now had a dozen of them. He constructed his own half-mile racetrack at Forest Hill, shaded by maples planted by his son, and bought Welsh and Shetland ponies for each child. By the mid-1870s, he often returned home from the office for lunch then spent the rest of the afternoon *en famille* in a constant flurry of outdoor activity. He dammed a stream to make two artificial lakes, one for boating, the other for swimming, and on sultry days often swam the mile-long circuit, a straw hat perched on his head to guard his fair skin from the sun. After becoming a biking enthusiast, he smoothed out many dangerously curving paths and rewarded visitors who learned to ride with free bikes. He took unusual delight in ice skating and frequently as many as fifty people—many of them strangers from the neighborhood—skated on the Rockefeller pond on a frosty day. Since he wouldn't allow the pond to be flooded on the Sabbath, Rockefeller sometimes rose after midnight on a freezing Sunday night to direct the workmen in preparing for the next day's skating.

Though he lacked interest in the homely interior of Forest Hill, Rockefeller spent hours daily out on the grounds. A tall, angular figure striding about and surveying the property, he planned new vistas, gravel paths, gardens, barns, and carriage houses. He created a fair-sized farm with sixteen cows and thousands of chickens. Serving as his own engineer and following the natural grades, Rockefeller laid out twenty miles of roadway for horse and buggy rides through stands of aspen, beech, oak, and maple trees. Supervising fifty or sixty workmen, he developed a limestone quarry on the property to service his grandiose projects and adorned the roads with picturesque bridges over streams. To secure striking vistas, he also began to relocate large trees and did this so expertly that they weren't damaged in transition. This constant rearrangement of his domain was more than just a matter of framing pretty views or beautifying a patch of garden. It was Rockefeller's typical way of remaking his own miniature universe and working out some vast, never-ending design.

For the Rockefeller children, life at Forest Hill could seem melancholy as they drifted alone about the huge estate, cut off from worldly temptation by their parents. This mood of solitary yearning especially afflicted John Jr., who was tutored at home until age ten and later described his boyhood self as "shy, ill-adjusted and frail."<sup>5</sup>

From the start he wasn't made of his father's indestructible stuff. On January 29, 1874, in an unusual moment of tearful joy, Rockefeller arrived at the Standard Oil office and informed Henry Flagler and Oliver Payne that Cettie had given birth to their first son. Dr. Myra Herrick delivered the infant in an upstairs bedroom at Euclid Avenue while Rockefeller waited expectantly across the hall. "How glad all were that the baby was a boy—for there had been four girls—and that he was perfectly formed," Cettie wrote.<sup>6</sup> She always associated the birth of Junior—as he was known to distinguish him from John Senior—with the launch of the Women's Christian Temperance Union in Ohio. As a founding member, she had planned to aid her evangelical sisters with rousing prayers and biblical hymns in local saloons, and, as she later told Junior, "I might have joined them, if a wee baby boy had not claimed me."<sup>7</sup> She fired him with that same crusading, Christian spirit and horror of liquor.

The baby boy was small and sickly, lacking his father's robust energy and reflecting his mother's more delicate constitution; for three years, his parents worried about his health. He had a cloistered childhood, insulated from a world that might contaminate his values. In later years, he could recall only a single male playmate from these early years, Harry Moore, the son of the Forest Hill housekeeper. "I had a camera and he and I took pictures and played together constantly."<sup>8</sup> Nevertheless, Junior found oases of enchantment on the estate and later cherished idyllic memories of summer afternoons spent rowing, swimming, and hiking. As they read aloud to one another, Junior and his sisters often lolled on a great beech tree whose limbs dipped over a creek. Even if his recollections sound highly idealized, with the shadows expunged, his boyhood letters are suffused with the warm glow of a protected childhood, secure in the love of his doting parents. Perhaps Junior's boyhood wasn't quite as lonesome as it seems from afar. Many decades later, his childhood friend Kate Strong reminisced to him, "You were quite the nicest boy that ever was in those days, so all your friends thought . . . affectionate, considerate, thoughtful and full of fun as well as wise almost beyond your years."<sup>9</sup> Junior was always bathed in female love, almost suffocated by it.

Just as Standard Oil workers never remembered a cross word from John Senior, so Junior couldn't cite a single instance of paternal anger. His father was patient and encouraging, if notably stingy with praise. As Junior said, his father was a "beloved companion. He had a genius with children. He never told us what to do or not to do. He was one with us."<sup>10</sup> In contrast to Big Bill's narcissism, John D. had an overdeveloped sense of family responsibility. John and Cettie never administered corporal punishment, and they inculcated moral principles by instruction and example. Each child was taught to listen to his or her conscience as a severely infallible guide.

For this boy destined to be the world's greatest heir, money was so omnipresent as to be invisible—something "there, like air or food or any other element," he later said—yet it was never easily attainable.<sup>11</sup> As if he were a poor, rural boy, he earned pocket change by mending vases and broken fountain pens or by sharpening pencils. Aware of the rich children spoiled by their parents, Senior seized every opportunity to teach his son the value of money. Once, while Rockefeller was being shaved at Forest Hill, Junior entered with a plan to give away his Sunday-school money in one lump sum, for a fixed period, and be done with it. "Let's figure it out first," Rockefeller advised and made Junior run through calculations that showed he would lose eleven cents interest while the Sunday school gained nothing in return. Afterward, Rockefeller told his barber, "I don't care about the boy giving his money in that way. I want him to give it. But I also want him to learn the lesson of being careful of the little things."<sup>12</sup>

When Rockefeller was complimented upon his son, he protested truthfully, "It was his mother who developed him."<sup>13</sup> Cettie brought up her children in her own ascetic style and tutored them in the rites of self-abnegation. She imagined that she presided with a light touch and had no idea that she could be quite overbearing. As she remarked, "I never like to interfere with the children so long as they make happy noises."<sup>14</sup> A sweet, good-natured woman, Cettie nevertheless had a strong didactic side that could verge on fanaticism. As she once confessed to a neighbor, "I am so glad my son has told me what he wants for Christmas, so now it can be denied him."<sup>15</sup> Dutiful, eager to please his mother, Junior absorbed the full force of her piety. "How good God is to have added to our lovely daughters our only son," Cettie later wrote. "Though the youngest, he is the strongest in courage, independence and Christian character."<sup>16</sup> She hemmed him in with numerous prohibitions. He was told that square dancing was promiscuous and immoral, and by age ten this little paragon had to sign a solemn oath that he would abstain from "tobacco, profanity, and the drinking of any intoxicating beverages."<sup>17</sup> Mother wasn't the only earnest female drumming him full of morality; Grandma Spelman also badgered him to attend children's temperance meetings. Thus, an

extraordinary contradiction lay at the core of Junior's life: While his father was being rebuked publicly as a corporate criminal, his mother was pumping him brimful of morality and religion. Like his father, Junior developed an upside-down worldview in which the righteous Rockefeller household was always under attack by a godless, uncomprehending world.

With three older sisters, John grew up in largely female surroundings as a delicate boy spared the rough play and teasing of brothers. He was feminized by the experience, wearing his sisters' cast-off dresses, learning to sew and knit, and even attending cooking classes, as if he might someday have to keep house and prepare his own sandwiches. Eight years older than Junior, Bessie was warmly attentive to her brother but inhabited a different world, and he grew up with the wilder and more willful Alta and Edith. One visitor remembered Alta as "mischievous, impulsive, the ringleader of the trio," while Edith was "scrutinizing, calculating," if high-spirited.<sup>18</sup> Because the girls got less attention than their brother did, they probably had more freedom to rebel and explore. As Alta once teased him, "We girls often thought John should have been a girl and we the boys of the family."<sup>19</sup> Despite his sex, Junior ended up as his mother's favorite because he was surely the most like her—obedient, crucified by duty, and almost too eager to please. The model child would struggle to become the model adult, with often painful consequences.

Soon after the Rockefellers had moved to 424 Euclid Avenue, they were followed by the Erie Street Baptist Mission Church—soon renamed the Euclid Avenue Baptist Church—the struggling church that had exerted such a formative influence upon Rockefeller's life. As far as fashion or convenience went, it would have behooved the Rockefellers to attend the nearby Saint Paul's Episcopal Church, where elegant couples stepped from tony carriages each Sunday morning. Instead, they drove back down Euclid Avenue to a plain brownstone church with a tall, narrow steeple and a lower-middle-class congregation. As Junior said, "There weren't half a dozen families that were not of limited means."<sup>20</sup> Rockefeller felt no discomfort at being surrounded by humble people and valued this continuity with his roots. He needed the spiritual refreshment of the plain but emotional Baptist style of prayer and probably also wanted to show that he wasn't being spoiled by wealth.

The Euclid Avenue Baptist Church was celebrated as the Rockefeller church and with good reason: By the early 1880s, he was covering half its annual budget, even pledging weekly money from his children and stipulating that "the 20 cents from each child will be earned by the sweat of their brows, pulling weeds, etc."<sup>21</sup> Avoiding clubs, theaters, and other such wicked haunts, Rockefeller was seen publicly only at church, a fixture in his ninth-row pew, his presence generating a growing army of ogles: curiosity seekers, feature writers, panhandlers, and idlers. He loved the bold, joyous, militant spirit of the Baptists and contributed openhandedly to their local charities. His foremost beneficiaries included the celebrated one-armed "Brother" J. D. Jones, who proselytized from a derelict barge moored to a Cleveland dock; the Ragged School, which taught the Bible and trade skills to vagabond teenagers; and the Cleveland Bethel Union, which preached temperance and Christianity to hard-drinking sailors and where Rockefeller himself often stopped by at lunchtime to mingle anonymously with the seamen.

Religion was a form of sustenance for Rockefeller, a necessary complement to his buttoned-up business life. Praising the ministry's role, he once said he needed "good preaching to wind me up, like an old clock, once or twice every week."<sup>22</sup> His life records no crises of faith, no agonizing skepticism toward the inherited orthodoxy of his youth. He believed that good works had to accompany faith, and even during the service his eyes darted around the room as he selected needy recipients of his charity. Taking small envelopes from his pocket, he slipped in some money, wrote the congregants' names on top, then unobtrusively pressed these gifts into their palms as they shook hands and said goodbye. He and Cettie also faithfully attended Friday night prayer meetings and were said to have seldom missed a gathering when in Cleveland over a forty-year period.

From 1872 until 1905, Rockefeller served as superintendent of the Sunday school—for a small portion of time he was seconded to a poor mission school—while Cettie headed the infant department. She liked to audit his classes and stare admiringly at him as he talked. He arrived early to kindle a fire then dimmed the gas lights at the close. In autumn, in an oddly poetic touch, he gathered up bushels of leaves and distributed them to the children. Many of his talks rang variations on the commonplaces of the temperance movement. "Boys, do you know why I never became a drunkard?" Rockefeller asked, scanning the room. "Because I never took the first drink."<sup>23</sup> To drive home his message, he told them not to be too free or easy or drink just to please the crowd. "Now I can't be a good fellow," he said sarcastically. "I haven't taken my first drink yet."<sup>24</sup> Each summer, he invited the Sunday-school teachers to a nonalcoholic picnic at Forest Hill, which was probably the most festive day on his annual calendar.

As word circulated that Rockefeller sometimes recruited Standard Oil employees from his Bible class, its size swelled enormously. He made any talk of business taboo, a lesson that one assistant superintendent, to his chagrin, belatedly learned. The man had bought oil at \$1.09 a barrel and tried to solicit Rockefeller's advice about whether to sell. The reaction, recalled by one member of the class, was swift and eloquent:

*Mr. Rockefeller immediately changed the expression of his face. He crossed his knees and then uncrossed them. He bent his body forward and proceeded to cross his knees again. But he never said a word. The assistant superintendent grew restless and a little embarrassed. . . . Finally the assistant superintendent asked: "If you were me, what would you do?" Rockefeller replied: "I would do what I thought best."*<sup>25</sup>

A fidgety silence was always Rockefeller's harshest expression of scorn.

While Rockefeller resented being pumped for advice, he himself mingled business and religion and converted the church into a powerful platform for espousing capitalism. He had no interest in theological disputation or in discussing otherworldly matters. To Sunday-school classes, he frequently reiterated his motto, "I believe it is a religious duty to get all the money you can, fairly and honestly; to keep all you can, and to give away all you can."<sup>26</sup> When he met his secretary out riding one Sunday, he advised her to save for a rainy day. "By way of apology for talking business on a Sunday," the secretary reported, "he said that there was a great deal of religion in good business."<sup>27</sup> The widening income inequality that accompanied industrialization didn't faze him because it formed part of the divine plan. By this stage of his career, Rockefeller's material success must have undergirded his faith. That he had earned so much surely signaled divine favor, a grace so awesome as to suggest that God had chosen him for some special mission—or else why had He favored him with such bounty? The usual picture of the Gilded Age is that greed eroded religious values, whereas for Rockefeller, his golden heaps seemed like so many tokens of heavenly support.

For John and Cettie, the temperance movement gratified their puritan itch to save the world, and their children joined a prohibition group called the

Loyal Legion, which scared them with evil visions of demon rum. As a charter member of the Women's Christian Temperance Union, Cettie and other well-bred ladies periodically descended on a Cleveland slum known as Whiskey Hill, which was mostly populated by immigrant mill hands. Around 11 A.M., they surged into the saloons, falling on their knees and praying for the sodden sinners. These militant ladies rented storefronts and set up a series of "friendly inns" that dispensed "wholesome foods and sarsaparilla" to thirsty "souls drowning in drink."<sup>28</sup> John was the principal donor of the main temperance outpost, Central Friendly Inn, making him an early pioneer in the settlement-house movement. Sometimes he joined Cettie on raids into the grogshops and never forgot how in one saloon he came upon a former classmate from E. G. Folsom's Commercial College who sat there, bloated and red-faced, doomed shortly to die from drink.

Cettie's parents had transferred their abolitionist ardor to the temperance cause after the Civil War. By 1870, they were living in Brooklyn, New York, where they exhibited the same fiery moralism that had distinguished their civic and religious activism in Ohio. In a division of labor, Mr. Spelman agitated to shut down the 2,500 rum shops he counted in Brooklyn, while Mrs. Spelman acted directly on drinkers through prayer and persuasion in taverns. During the post-1873 depression, Mr. Spelman foresaw an impending Armageddon pitting rum against temperance, Satan against Christ. He viewed hard times as the Lord's punishment for avarice manifested by the grasping demands of both workmen and employers. As he sternly concluded, "God's method for punishing man's folly and extravagance are silent, but resistless."<sup>29</sup> Mr. Spelman, who now drew a paycheck from Standard Oil in New York, couched his economic views in terms that suited his son-in-law. "The great trouble arises from extravagant management and reckless and ruinous competition on freights," he declared, tacitly endorsing monopoly. After Harvey Spelman died in 1881, his wife returned to Cleveland to live with John and her two daughters, Cettie and Lute, and the combined influence of the three Spelman women added to the militant, Christian spirit that informed the Rockefeller household.

The man who was now infuriating his rivals with the devilish cunning of his business methods was a tender son to his aging mother. Eliza retained the old Cheshire Street house, where John's portrait held pride of place above the parlor mantel. Though she spent most of her time with Frank and Mary Ann, she reserved summers for Forest Hill. She was still profoundly attached to her eldest son. She confided in John, felt a peaceful glow in his presence, and he responded with deep compassion. As Junior recalled, "She always sat next to Father at the table and how well I can remember often seeing him hold her hand lovingly at the table. Grandmother trusted Father absolutely and loved him devotedly. 'John's judgment' on any question was to her always right and the last word."<sup>30</sup> Rockefeller wrote often to "his dear mother" and struck a note of fond banter not evident elsewhere in his letters. "Your rooms at Forest Hill seem very lonesome and we hope you will not permit them to remain vacant all the summer," he wrote her one June. "The robins already begin to inquire for you and we can have the whole lawn full if you will only come back to greet them."<sup>31</sup>

By the late 1870s, Eliza's health began to fail—she was now in her late sixties—and John pleaded with her to stop smoking her pipe. In a preview of her son's later alopecia, all her hair fell out and she sometimes wore a gray toupee. As Eliza's strength declined, John grew more solicitous. "When she was feeling ill and confined to her room, Father would go to her in his quiet, cheery, reassuring way and tell her she was doing nicely and would soon be well," said Junior, "whereupon she never failed to take new courage and improve in health."<sup>32</sup> Her maladies took precedence over Standard Oil business, and if she had a nervous attack while John was at a meeting, he rushed back to Forest Hill, went straight to her bedside, took her hand, and said, "There, there, Mother. It's all right."<sup>33</sup>

To explain his father's disappearance, John D. often told people that Bill had asthma—which was true as far as it went—and needed a dry, warm western climate. Once or twice a year, Devil Bill—or Dr. William Levingston—popped up in Cleveland in his typically idiosyncratic fashion. Without any warning, he telephoned Forest Hill from the last stop of the Cleveland trolley line and asked to have a carriage sent to fetch him. Or he appeared in an impressive rig, behind a fine team of horses, and rode grandly up Euclid Avenue. Or, pulling up in front of the Standard Oil building, he bolted up the steps like a much younger man. A blithe spirit, he wandered about and always did as he pleased. As one Standard Oil attorney said, "If you didn't like it, you could go hang!"<sup>34</sup> He still looked impressive, with a bald head, massive forehead, and a full red beard now speckled with gray. In many respects, he was the same carefree, ebullient spirit of yesteryear, sporting snappy clothes and a diamond stickpin in his shirtfront, playing his fiddle, cracking jokes, and telling tall tales.

As they got older, the Rockefeller children were enchanted by Grandfather Rockefeller, whom they regarded as a colorful, folksy relic of the family's rustic past. Innocent of his darker side, they loved his rough country ways, lusty fiddling, and bawdy humor. His antics must have relieved the bottled-up tensions in this straitlaced household. Junior, who found him "jolly and entertaining," said, "My Grandfather Rockefeller was a most lovable person. . . . All the family loved him. He was a very entertaining man, coming and going when he felt like it."<sup>35</sup> Much as he once had with his own children, Bill gave his grandchildren rifles and taught them to shoot, nailing a bull's-eye to a distant tree and regaling them with tales of his wild-duck hunting. The sassy Edith pleased him most, and when she hit the target, he executed a dance (much like John) and hollered, "Bet you she hits it eight times out of ten!"<sup>36</sup> After a few days of such uproarious times, Grandpa would abruptly disappear, giving no sense of where he went.

John resented his father and never wrote to him, but he didn't poison the children's minds against him, and he behaved civilly in his presence, even if he kept studiously aloof. To strangers and the press, he never spoke of his father as anything but a fine, upstanding figure. Bill's visits provoked similarly ambivalent sentiments in Eliza. When he visited Forest Hill in 1885, she refused, at first, to see him, blaming a stitch in her side, then agreed to spend the day with him. By this point, she was surely glad to be rid of him.

In many respects, Bill's life as Doc Levingston resembled his former life with Eliza. He spent winters with Margaret in Freeport, Illinois, then took to the open road for the rest of the year, leaving her alone. A renegade individualist, he felt that footloose American urge to eke out a living on the fringes of civilization, and he penetrated ever farther into the wilderness. As a flimflam man, he had to practice his wiles on country bumpkins and other credulous folks and stay away from skeptical city slickers. Either because suckers had grown scarce or sheriffs more vigilant, he now traversed entire states to peddle his wares.

In his incarnation as Dr. Levingston, Bill had to not only endure the silent lash of John's indignation, but forgo any claims to his money. Could God have devised a more excruciating curse for his sins? Faced with his son's dizzying wealth, he must have sometimes pondered whether to throw off his

disguise and resume his Rockefeller identity. Yet this was not a feasible option, since he could not do so without shocking Margaret and betraying his own shameful bigamy. So the father of the leading figure in the oil industry went on practicing his petty scams on the road under an assumed name.

Rockefeller’s sisters played a limited role in his adult life. His favorite sister, Lucy, was sweet and placid, arguably the best-adjusted sibling, but she was chronically sick and died in 1878 at age forty—the event that probably triggered the deterioration of Eliza’s health. Her husband, Pierson Briggs, spent nearly fifteen years as a purchasing agent for Standard Oil of Ohio. He was a kindly, jolly man and very popular with John’s children. After Lucy’s death, Briggs remarried into a wealthy Cleveland family while his musical daughter, Florence, spent a great deal of time at Forest Hill under the watchful care of John and Cettie.

The younger sister, Mary Ann, married a genial man named William Rudd, the president of Chandler and Rudd, a Cleveland grocery concern, and they had two sons and two daughters. Quiet and withdrawn, Mary Ann turned into a queerly reclusive personality. Always clad in funereal black clothes that covered a deformed body—some people thought she was a hunchback—she laid down arbitrary social rules at her Euclid Avenue house. For example, visitors had to arrive punctually and could only stay briefly. Despite her husband’s wealth, Mary Ann insisted on a crackpot frugality and behaved as if they were always strapped for cash. In a morbid caricature of the Protestant work ethic, she scrubbed the front porch of their plain white house, performed her own housework, and refused to have any servants. She never went to church and seldom visited John and Cettie, even though they lived a short distance away. The antithesis of his hermit wife, William Rudd was a frequent visitor at Forest Hill, where he found a refuge from the lugubrious atmosphere at home. One of John D.’s favorite people, Rudd overflowed with gags and pranks, and his pockets always bulged with nuts and candy for the children. One day, he lugged a sack of dirty old potatoes to Forest Hill; the Rockefeller children were mystified until they found a gold piece artfully tucked into each potato.

Of the three brothers, John remained the most like Eliza, while William mixed qualities of both parents. Frank aped Bill’s swaggering ways. He was an avid hunter and rollicking storyteller who loved to drink, smoke cigars, make boisterous jokes, and hobnob in Cleveland clubs. Yet increasingly, a disagreeable side surfaced in Frank: Choleric, paranoid, and suspicious, he constantly clashed with John. As one of Frank’s friends said, “You never saw two men from one family that were more unlike.”<sup>37</sup> Though they went through periods of reconciliation, their mutual dislike soon ripened into a hatred that split the family, with William lining up with John and Big Bill siding with Frank. Although he liked William—who often tried to make peace between his brothers—Frank felt William was too much under John’s thumb, and it irked him that he, too, didn’t rebel openly against John’s leadership.

After being wounded in the Union army, Frank attended business school and, like John and William, got a bookkeeping job in a small commission house. But unlike his brothers, he didn’t prosper, foreshadowing things to come. Trying to emulate his brothers, Frank entered oil refining as a competitor to Standard Oil after he married the tall, handsome Helen E. Scofield in 1870. The Scofields were a relatively old Cleveland family, and Helen’s father, William Scofield, was a partner in Alexander, Scofield and Company, one of the major refiners that John absorbed during the 1872 Cleveland Massacre. That Frank married the daughter of one of John’s chief competitors could only have been interpreted by John as a provocation.

In 1876, the antipathy between the two brothers flared into open conflict when Frank testified before a congressional committee probing the South Improvement Company and charged John with heavy-handed tactics in buying out Alexander, Scofield. Already sensing the press’s insatiable desire for incendiary statements about his brother, Frank electrified reporters with John’s warning, “We have a combination with the railroads. We are going to buy out all the refiners in Cleveland. We will give every one a chance to come in. We will give you a chance. Those who refuse will be crushed. If you don’t sell your property to us it will be valueless.”<sup>38</sup> According to Frank, the experience of Alexander, Scofield wasn’t unique. “There are some twenty men in Cleveland who sold out under the fright, and almost any of them would tell you that story.”<sup>39</sup> Confronted with this indictment years later, John shook his head sadly and moaned, “Poor Frank!”<sup>40</sup> Indeed, after these public outbursts, Frank often came to John and apologized profusely. “John, can you forgive me? I have been an ass.”<sup>41</sup> One possible reason for this contrition was that Frank was chronically in debt to his brother.

Every time the brothers tried to call a truce, it ended abysmally. After allegedly being squeezed out in 1872, Frank took the money for his Alexander, Scofield interest and invested in a fleet of Lake Erie boats. In a conciliatory gesture, John gave him a contract for Standard Oil shipments, but Frank botched the opportunity. While Frank was away hunting, Standard Oil urgently needed more lake shipments, and his poorly maintained fleet couldn’t cope with the increased volume. When Frank returned to Cleveland, John reprimanded him sharply. “Frank, this will have to stop. If you are going to attend to business, very well. If not, we shall have to make other arrangements.” When Frank grew belligerent, John replied, “What do you think your interest in those boats is worth? State your figure!” The following day, John wrote a check and bought up Frank’s interest in the boats.<sup>42</sup> Frank incessantly gambled in stocks and commodities, further alienating his more prudent brother.

Also aggravating fraternal tensions was the fact that John despised Frank’s father-in-law, William Scofield, a relationship so acrimonious that John supposedly told Sam Andrews on one occasion, “There, Sam, is Scofield. I’ll knife that fellow under the ribs some day. You’ll see.”<sup>43</sup> The story was told to Ida Tarbell by Cleveland refiner J. W. Fawcett and might be apocryphal—Rockefeller almost never spoke so viciously—but he did bear a special grudge against Scofield. When Standard Oil bought out Alexander, Scofield in 1872, the selling partners pledged to steer clear of refining. Nevertheless, a year later—in what Rockefeller considered an unforgivable breach of faith—Scofield organized a new refining company, Scofield, Shurmer and Teagle. “They were a lot of pirates,” Rockefeller said later. “You may call them that with justice.”<sup>44</sup> After fuming for three years, he cut a secret deal with his nemesis in 1876. Investing \$10,000 in Scofield, Shurmer, he forged a joint venture, agreed to purchase crude oil for them, market their refined oil, and negotiate their railroad rebates, while also assigning them a refining quota. In thrashing out this deal, Rockefeller and his new secret partners agreed to communicate by a special post-office box, prompting Ida Tarbell to write, “In fact, smugglers and house-breakers never surrounded their operations with more mystery.”<sup>45</sup> If Rockefeller imagined he had neutralized a rival, he was soon disabused. When Scofield, Shurmer produced far beyond their quotas, Standard Oil was forced to sue them. In a significant decision—but one that didn’t inhibit Rockefeller in future—a Cleveland judge ruled against Standard Oil in 1880, saying that by assigning production limits to a competitor, it had executed a contract in restraint of trade.

In 1878, in yet another affront to his brother, Frank joined with C. W. Scofield and J. W. Fawcett to start a Cleveland refinery known as the Pioneer

Oil Works. Often operating through William as an intermediary, John began a determined campaign to bring Frank's company into Standard Oil, telling him that Standard could refine oil at half the cost. At first, this campaign seemed to backfire. In the spring of 1879, Frank began to plot strategy with some independent refiners from Marietta, Ohio, who had accused Standard Oil of colluding with the railroads and wanted to take the company to court. John D. was mortified when subordinates informed him that his youngest brother was holed up at a drugstore down the block along with men who were trying to buttonhole Standard Oil executives and serve them with subpoenas. Things grew only more lunatic with the passage of time.

## *Insurrection in the Oil Fields*

In 1875, Henry E. Wrigley, the head of the Pennsylvania Geological Survey, issued a doomsday warning that the state—and hence the world—production of oil had peaked and would soon experience a precipitous decline, aggravating fears that had overshadowed the oil industry since its inception. Within months, his forecast was refuted when a new field was discovered in Bradford, Pennsylvania, northeast of the old Oil Creek fields. As thousands of wild-eyed drillers besieged the area, oil production soared, and prices sank from \$4 a barrel in 1876 to 70 cents two years later. Once again, the industry’s salvation proved its undoing, with the boom-and-bust cycle unleashing volatile emotions among producers who found themselves rich one moment and then desperate the next.

As the master of storage tanks and pipelines, refineries and by-product plants, *Rockefeller* had become a byword in the oil fields, a phantom of vast, indeterminate proportions who operated entirely through agents. His remoteness frustrated opponents, who felt they were boxing with a ghost. In the crisis provoked by the new Bradford production, he was blamed for price manipulation even when he simply reflected the law of supply and demand. With the immediate-shipment controversy of 1878, the running warfare between Standard Oil and the producers expanded from minor skirmishes into a large, violent engagement reminiscent of the South Improvement Company furor.

The roots of the controversy were as follows. As oil wells sprang up around Bradford, Standard Oil wanted to retain its pipeline monopoly and worked overtime to connect new wells to its system free of charge. In a bravura performance, Daniel O’Day’s scrappy, hustling teams hooked up five wells a day to the United Pipe Lines network and threw up huge tank farms to store the surplus oil. They moved at a breathtaking tempo: Between April and November 1878, the Bradford tankage swelled from a little more than 1 million barrels to 4.5 million. Nonetheless, the producers, repeating past errors, exercised no discipline and drilled far beyond the system’s capacity. When their oil ran into the ground for lack of storage space, they didn’t praise Standard’s efforts to accommodate them but detected a malevolent conspiracy. O’Day’s letters to Rockefeller reflect exasperation at the misperception. No matter how fast they went, he moaned, “There will be at least ten thousand barrels a day that I don’t know how we can move, no matter how good our disposition to do it might be.”<sup>1</sup>

Nevertheless, if he didn’t create the crisis, as many producers believed, Rockefeller never passed up a chance to exploit a legitimate advantage against his beleaguered rivals. With its tanks overflowing, Standard Oil issued a sweeping edict that it would no longer accept oil for temporary storage but only for immediate shipment to refineries. Standard Oil quoted a purchase price for crude oil a full 20 percent below prevailing prices, then stalled on payments to desperate producers. One market letter caustically described this policy as a “bull issued by his infallible holiness Rockefeller.” It was a terribly high-handed and insensitive way to respond to the crisis.<sup>2</sup> But even by oil-industry standards, the producers reacted with exceptional fury. Every day, sullen mobs lined up at the Standard Oil office and grudgingly negotiated their oil shipments. With wide room for partiality, Standard Oil favored shipments to its own refiners—a fact that struck Rockefeller as eminently fair—while producers argued that the pipeline network was a common carrier and obligated to treat everyone equally. Producers felt that their fortunes, their very lives, hung in the balance. As one Standard Oil lawyer recalled, “Arson and murder were threatened by the producers, who marched in masked bands at midnight uttering their threats.”<sup>3</sup> One of O’Day’s men reminisced, “They paraded at night in big gangs, covered with sheets from head to foot in regular ku-klux fashion, groaning and booing the Standard.”<sup>4</sup> Orators urged the burning of Standard pumping stations, the skulls and crossbones appeared on Standard buildings, and vandalism spread.

To mollify producers, the state of Pennsylvania deputed William McCandless, its commissioner of internal affairs, to study the petroleum industry. Officials of the Standard pipelines, who now arrogantly behaved as if they owned the oil industry, ignored his subpoenas and boycotted testimony. Nevertheless, when McCandless issued a report in October 1878 that exonerated Standard Oil, the producers erupted in hysterical protest. It was widely rumored that McCandless had been bribed, and on the Bradford streets he was hung in effigy with a big, bogus \$20,000 check, signed by Rockefeller and endorsed by the Pennsylvania Railroad, protruding from his pocket. Newspapers told how one Bradford man invited Rockefeller to the region but then, remembering the imbroglio, warned him instead, “Don’t you do it, for if you do, you will never come back alive.”<sup>5</sup>

The immediate-shipment controversy engendered mutual enmity, for Rockefeller saw the producers as so many ingrates and malcontents whose oil was worthless without his superefficient United Pipe Lines system, which would soon be connected to twenty thousand wells. He mockingly described his foes’ attitude as follows: “We have disregarded all advice, and produced oil in excess of the means of storing and shipping it. We have not built storage of our own. How dare you refuse to take all we produce? Why do you not pay us the high prices of 1876, without regard to the fact that the glut

has depressed every market?”<sup>6</sup> The episode convinced Rockefeller that the producers nursed an unreasonable hostility against him, and this inoculated him against even valid criticism. But unlike the producers, Standard Oil paid no real penalty for the Bradford crisis and in 1878 declared an impressive \$60 dividend on shares with a \$100 par value. Rockefeller had positioned himself exactly where he wished to be—poised to profit from either surplus or scarcity and all but immune to the vagaries of the marketplace.

As masses of drillers descended upon Bradford, this major shift in the geography of oil awakened dormant ambitions in Rockefeller’s foe, Tom Scott of the Pennsylvania Railroad. As Standard Oil erased the surviving independent refiners, competing pipeline and railroad officials were petrified that Standard might soon be in a position to eliminate their oil traffic at whim. Since it had tracks near the Bradford wells, the Pennsylvania spotted a chance to loosen Standard Oil’s grip and win new business. Its vehicle for this challenge was its assertive subsidiary, the Empire Transportation Company, which owned five hundred miles of pipeline and one thousand tank cars. Empire had had the temerity to threaten Standard Oil in its refining strongholds, buying up rivals in New York, Philadelphia, and Pittsburgh and trying to win over new refining customers with bargain transportation rates. Now, as if spoiling for a fight, the Empire began to lay pipes for pumping crude oil from Bradford to the seaboard refineries—a direct challenge to Standard Oil dominance.

The driving force behind this incursion was a man who was *almost* a match for Rockefeller but who fancied that, had Rockefeller only played fair, he would have been much *more* than a match: Colonel Joseph D. Potts, president of Empire Transportation. A civil engineer descended from a family of Quaker iron-masters, Potts was a capable man who had attained a colonel’s rank in the Civil War. He had a prominent nose and a long preacher’s face, fringed by a white beard. Gravely earnest, no less conversant with the Bible than with the oil industry, Potts aspired to be Rockefeller’s equal. If Rockefeller respected Potts’s “indomitable will,” he also patronized him as “a shrewd oily man, as smooth as oil.”<sup>7</sup> Potts repaid the compliment, castigating Rockefeller as a merciless predator. Of Rockefeller’s current refiners’ cartel, the Central Refiners’ Association, Potts said memorably, “It resembled the gentle fanning of the vampire’s wing, and it had the same end in view—the undisturbed abstraction of the victim’s blood.”<sup>8</sup>

When Potts poached on his territory, Rockefeller demanded a meeting with Tom Scott and A. J. Cassatt of the Pennsylvania Railroad. As his private reminiscences attest, Rockefeller was cynical about Empire, which he thought a transparent front for corrupt Pennsylvania officials to line their pockets with profits that belonged rightly to shareholders; it was also, he saw, a handy vehicle for the railroad to cheat on pooling agreements while escaping detection. In confronting the railroad officials, Rockefeller struck a characteristic tone of injured innocence: “Here, I have gone out of my way to be friendly to the Pennsylvania in the allotment of oil shipments and now you gentlemen are permitting your associate, Colonel Potts, actually to invade the Central Association’s field. Why, it is nothing less than piracy! You must call off this poacher, Potts.”<sup>9</sup> Although nearly two-thirds of the oil carried by the Pennsylvania Railroad now originated with Standard Oil, Scott decided to flout his biggest customer and, if not annihilate Rockefeller, chop him down to size.

Rockefeller interpreted Scott’s intransigence as a declaration of war. In taking on the Pennsylvania Railroad, he was battling America’s most powerful corporation, yet he proceeded with unwavering confidence. In spring 1877, Rockefeller told railroad officials point-blank that if Empire didn’t retreat from refining, Standard Oil would divert its shipments to other railroads. When they didn’t flinch, Rockefeller launched an all-out attack. To starve out the railroad, he idled all his Pittsburgh refineries and ordered corresponding increases in output in his Cleveland refineries. He sent out word that Standard Oil refineries should fiercely undersell Empire refineries in every market where they vied for kerosene sales. Turning to the two railroads long solidly in his corner, the Erie and the New York Central, Rockefeller had them trim rates to ratchet up the pressure on the Pennsylvania Railroad. To handle the extra volume expected on these two railroads, Flagler negotiated a deal with William Vanderbilt to build another six hundred tank cars. With blazing speed, Rockefeller was on his way to humbling the world’s largest freight carrier, a company long thought invincible in the business and political world. Afterward, A. J. Cassatt admitted that the railroad had to grant such large rebates to keep up with Standard Oil that it ended up literally paying shippers to transport their oil.

In the end, providence itself conspired in the railroad’s comeuppance. As he slashed rates to withstand the Standard onslaught, Tom Scott fired hundreds of workers and reduced wages 20 percent. When he doubled the length of trains without expanding their crews, trainmen walked off the job in protest. After the Baltimore and Ohio Railroad announced comparable wage cuts in 1877, the protest flamed up into a general railroad strike, one of the bloodiest battles in American labor history, resulting in dozens of fatalities. In Pittsburgh alone, 500 tank cars, 120 locomotives, and 27 buildings were torched by union vandals, sabotage so costly that Pennsylvania officials tapped Wall Street for a large emergency loan from Drexel, Morgan and Company. As state governors ordered out their militias and President Rutherford B. Hayes supplemented them with federal troops, the country watched the insurrection in horror. However pleased by the railroad’s travails, Rockefeller must have felt a dreadful chill as rumors circulated that two thousand pistol-packing radicals would march down Euclid Avenue. After the riots ended, one Titusville reporter disclosed that the Oil Creek citizenry had nearly exploited the upheavals to take revenge against Standard Oil: “Had certain men given the word there would have been an outbreak that contemplated the seizure of the railroads and running them, the capture and control of the United Pipe Line’s property, and in all probability the burning of all the property of the Standard Oil Company in the region.”<sup>10</sup> Though after burning more than two thousand freight cars the strikers capitulated, their revolt inaugurated a new age of labor militance in American industry.

Reeling from these blows, the Pennsylvania Railroad skipped its dividend, sending its share price tumbling on the stock exchange. Though Potts wished to fight on, Scott was inclined to relent. Although the railroad didn’t wholly own Empire, it had an option to buy the remaining shares, and, faced with Potts’s recalcitrance, Scott did just that. It amused Rockefeller how agilely Scott switched direction when it served his interest and how—without notifying Potts, who would resent his treachery—he dispatched A. J. Cassatt to Cleveland to tell Rockefeller and Flagler that he was “anxious for a settlement.”<sup>11</sup> Rockefeller gloated over Potts’s crushing defeat: “The effort of Colonel Potts to make it appear that he was the great Moses failed, utterly failed.”<sup>12</sup>

Empire’s capitulation represented a greater boon than Rockefeller had envisaged, for the spoils were bountiful. The cash-strapped Scott didn’t simply agree to stop refining oil but offered Standard Oil a huge fire sale of assets—refineries, storage tanks, pipelines, a fleet of steamships, tugboats, barges, loading docks—in fact, far more than Standard could afford. During negotiations with Rockefeller at a Philadelphia hotel in October 1877, Scott swept

in with a selfconfident panache that thinly camouflaged his defeat. As Rockefeller recalled, “I can see [Scott] now with his big soft hat, marching into the room in that little hotel to meet us; not to sweep us away as he had always done, but coming in with a smile, walking right up to the cannon’s mouth. ‘Well, boys, what will we do?’ ” In the ensuing talks, Scott drove a tough bargain and refused to budge on two conditions: that Standard Oil buy *all* of Empire’s assets, including its antiquated lake vessels; and that within twenty-four hours it pay \$2.5 million of the \$3.4 million offering price by certified check.

This last demand taxed even Standard Oil, which had only about half the necessary cash in its coffers. Rockefeller raced back to Cleveland and flew through local banks in a hectic tour such as he hadn’t made in years. Climbing into his buggy, he approached one bank president after another and told them breathlessly, “I must have all you’ve got! I need it all! It’s all right! Give me what you have! I must catch the noon train.”<sup>13</sup> Unable to persuade his Standard Oil confrères to buy the steamships—Rockefeller always operated by consensus—he had the nerve to borrow several hundred thousand dollars on his own account and buy the ships himself. Although these money-losing ships drained him for years, their purchase was dictated by the larger interest of Standard Oil, and he never regretted his snap decision.

In dueling with Scott, Rockefeller didn’t try to demolish him—as Scott might have done to him—but called a truce to strengthen their alliance. His constant aim was to be conciliatory whenever possible and extend his range of influence. In a new pooling arrangement, Standard Oil agreed to ship at least two million barrels yearly over the Pennsylvania Railroad and restore its faded luster in the oil trade; in exchange, Standard would pocket a 10 percent commission (read: rebate) on its shipments over the road. More important, Standard was designated as the enforcer—that is, the enforcer—of a new master plan brokered by the railroads whereby the railroad would receive 47 percent of all oil traffic; the Erie and the New York Central 21 percent apiece; and the B&O 11 percent. Tightening the vise, Rockefeller’s pipeline chieftain, Daniel O’Day, informed the Pennsylvania Railroad in February 1878 that Standard would henceforth want at least twenty cents for *every* barrel of crude oil the railroad shipped—an arrangement Standard Oil had foisted upon the Erie and the New York Central. Having outsmarted the largest railroad, Rockefeller had acquired a stranglehold on the three major roads, and his taming of the imperious Tom Scott guaranteed that no railroad president would ever dare to tangle with him again.

The defeat left Colonel Potts a broken, humiliated man. As his son recalled, “He always believed some of the Pennsylvania directors had been approached by the Standard and bought out. Others talked of bribery; of course nothing could be proved.”<sup>14</sup> In all likelihood, Potts didn’t want to admit that he had been outwitted by Rockefeller. Ida Tarbell, in her romanticized view of some of Rockefeller’s foes, converted Colonel Potts into an incorruptible martyr, the Abraham Lincoln of the oil industry, crucified by Standard Oil, when he was just an able, aggressive businessman who lost out in a power struggle to a shrewder, bolder opponent. In the early 1880s, Potts renounced his principled opposition to Standard Oil and became an active director of the National Transit Company, a Standard Oil pipeline subsidiary.

The Grand Guignol of the Empire battle diverted attention from another momentous drama that unfolded at about the same time: the purchase of the Columbia Conduit Company from Dr. David Hostetter. For Rockefeller, the Columbia purchase had far-reaching strategic implications, for the pipeline functioned as the B&O’s crude-oil lifeline. Columbia pumped western Pennsylvania crude to the B&O’s Pittsburgh terminal, whence it traveled by rail to Baltimore refineries. Thus, if he could smother Columbia, Rockefeller would be able to conquer the fourth and last major railroad system while also gaining uncontested control of *all* major pipeline systems connecting oil wells to railroad trunk lines. He would have extended his reach, in short, into every nook and cranny of the oil industry. As Ida Tarbell noted, after the Columbia Conduit fell into Rockefeller’s lap, “Practically not a barrel of oil could get to a railroad without [Rockefeller’s] consent.”<sup>15</sup>

By this point, Standard Oil had effectively stamped out competing refiners in Cleveland, Philadelphia, and Pittsburgh and faced only a smattering of weak New York holdouts. The last major pockets of resistance lay in West Virginia and Baltimore, whose refiners relied upon the B&O. Thus, by controlling the Columbia Conduit Company, Rockefeller would be able to snuff out the last independent refiners. Conversely, if he controlled the West Virginia and Baltimore refineries, he could pressure the railroad into submission.

The man assigned to carry out this convoluted campaign was Johnson Newlon Camden, the Parkersburg, West Virginia, refiner whose company had secretly joined Standard some years earlier. Elected to Congress several times, Camden later served as a U.S. senator, but his civic involvement didn’t translate into superior business ethics. On the contrary, Camden dealt with rivals in an especially coercive manner, as he showed in early 1876 when absorbing Pittsburgh refiners. To snuff out the last competitors, he peremptorily informed Alexander McDonald, the leading supplier of barrel staves to the city’s independent refiners, “that no staves must be sold to Pittsburgh, that it was our policy to control the oil business of Pittsburgh by controlling the supply of staves and barrels at that point,” as he told Standard headquarters. Further, McDonald was under strict instructions, he said, “that he must ship no staves to Pittsburgh without [Standard Oil’s] consent.”<sup>16</sup> Whenever competition flared up in Pittsburgh, Rockefeller dispatched Camden to douse the flames, once telling him, “At this particular moment it is especially important that outside Pittsburgh refineries should have no chance whatever in any market for local trade oil. . . . Our feeling of anxiety to accomplish the object of centralization is so strong we want you to yield to it for a few days longer when we hope you will be forever relieved.”<sup>17</sup>

Like Rockefeller, Camden had a devious talent for concocting anticompetitive practices and paralyzing the trade. To soften up local competitors, he cornered the supply of West Virginia crude, leaving independent refiners high and dry. When confronted with such shameless manipulation, Rockefeller sighed, disclaimed any knowledge, and blamed overly zealous subordinates—a recurring pose in his career. But Camden, like other subordinates, kept Rockefeller thoroughly posted about his actions and told him apropos of early negotiations with independents, “I am having interviews with all the little refinery men here [Parkersburg] and at Marietta. . . . We will either get them or starve them.”<sup>18</sup>

Camden was thwarted by the same problems that had confronted Rockefeller in forming cartels in other cities. Aware that Standard would buy ramshackle plants to shut them down, many blackmailers entered the business in order to sell out. The harried Camden grouched that small refineries were “multiplying like rats” and concluded despairingly that they would be “as hard to keep down as weeds in a garden.”<sup>19</sup> As Standard Oil succeeded in steadying kerosene prices, it drew people back into the business. At this point, Rockefeller took a tougher line with blackmailers who wanted to be bought out. In responding to several Baltimore refiners who had previously rejected fair prices from Standard Oil but now wished to sell, Rockefeller sounded like the voice of divine retribution, telling Camden that “they will be sick unto death now having failed in their wicked scheme. A good

sweating will be healthy for them. If . . . these people could wait and sell out their works at a loss, thereby making a poor speculation of blackmailing, it would probably cure this batch and save you endless trouble in future.”<sup>20</sup> Camden’s files support Rockefeller’s contention that he bought loads of worthless junk and enriched men who knew little about refining oil but everything about extortion.

Applying a formula that Rockefeller had perfected in New York, New Jersey, and Philadelphia, Camden bought waterfront property in Baltimore, where he erected wharves and warehouses for a B&O oil-export terminal. With Standard Oil now embedded in the local transportation infrastructure, it became impossible for Baltimore refiners to operate autonomously. Standard Oil had become virtually indistinguishable from the railroad industry. On December 21, 1877, Camden triumphantly told Rockefeller that they had completed their conquest of the last independent refining center. “We have cleared up every seed in which a refining interest could spring up in Baltimore, so far as we can at present determine.”<sup>21</sup>

Thus, only five years after the Cleveland Massacre, the thirty-eight-year-old Rockefeller, with piratical flair and tactical brilliance, had come to control nearly 90 percent of the oil refined in the United States. Perhaps a hundred tiny refineries still eked out a meager living in the interstices of the industry, but they were mostly tolerated as minor nuisances and scarcely threatened Standard Oil. As Rockefeller himself acknowledged, these isolated cases served a useful political purpose, providing a mirage of competition when it had ceased to exist altogether. He liked to point to these doughty survivors as proof that all the stories about the strong-arm tactics of Standard Oil were grossly exaggerated and that the oil industry was a scene of vibrant competition.

In his implacable quest to rule the oil business, Rockefeller shifted focus in the late 1870s from the railroads to outright ownership of the superior alternative: pipelines. Undeterred by prophecies of exhausted oil fields, Standard Oil had both the capital and the incentive to blanket western Pennsylvania with a gigantic maze of pipelines. By 1879, the combine controlled almost the entire pipeline system, siphoning crude oil from thousands of wells and pumping it to storage tanks or railroad depots. When a driller struck oil, Standard Oil swooped down in a flash to connect his well, assuring both his livelihood and irrevocable reliance on the combine.

Standard’s rough, brawling pipeline boss, Daniel O’Day, made sure that his construction gangs kept pace with the new fields, laying pipe at a furious pace of up to one and a half miles per day. O’Day stood forth as the agent of wealth or ruin for producers. If he wanted to punish a producer, he might hint that the producer’s backcountry well was too inaccessible for Standard to run a line through the woods. And if the producer lacked money to erect storage tanks, he might watch his fortune seep into the ground as he bickered impotently with Standard Oil.

That O’Day exploited his power to silence dissent and cripple refractory competitors is amply documented in Rockefeller’s papers. It is important to recall that O’Day, like other Standard Oil lieutenants in the field, was the executor of Rockefeller’s will, whatever the latter’s disclaimers. When O’Day discovered that a producer named Murphy held a small stake in a competing pipeline, he dispatched to the scene John D. Archbold, who pointedly reminded this upstart that he had expected Standard “to take care of his production that might be located far back in the interior, as we have always done for him, and where such companies as the Pittsburgh line would not care to go.”<sup>22</sup> O’Day scared the daylights out of railroads, too. When one railway official complained that Standard was hogging crude-oil shipments between Olean, New York, and Buffalo, O’Day retorted that Standard Oil might just decide to ship all the refined oil by pipeline as well. As O’Day reported with glee to Rockefeller—who again professed ignorance of such machinations—“This seemed to stagger him a little and we may be able to hold it over him (as a club) successfully.”<sup>23</sup> While Rockefeller communicated with his subordinates in genteel fashion, discussing muscular tactics with unctuous euphemisms, his colleagues were less restrained and gloried in their brutal shenanigans.

As Rockefeller consolidated his virtual monopoly over the pipeline network, it provoked pandemonium along Oil Creek, where he was now dubbed the Lord of the Oil Regions. In late 1877, desperate independents thronged a “Petroleum Parliament” in Titusville, hoping to plot their escape from Standard Oil servitude. These extended, crowded sessions generated a host of resolutions, including enactment of a free-pipeline bill and another to prohibit railroad-freight discrimination. But Standard Oil spiked all such reform efforts through the liberal application of backdoor payments to legislators.

In a historic departure, the independents endorsed plans for two long-distance pipelines that would bypass the whole Standard-rigged web of pipelines and railroads and open a path to the sea. The less ambitious project was the Equitable Petroleum Company, formed by Lewis Emery, Jr., to pipe oil from the Bradford fields to a railroad that would then carry the oil to Buffalo, where it would travel east over the Erie Canal. This roundabout route posed only a modest threat to Standard Oil, yet Rockefeller wired Daniel O’Day, “Don’t let them get a pipe to Buffalo.”<sup>24</sup> To sabotage the effort, Standard Oil unleashed its full arsenal of obstructive tactics. It bought up the connecting railroad to Buffalo; threatened to yank orders from pipe manufacturers who sold to Equitable; and disconnected pipelines from all Bradford refiners who dealt with it. Despite this intimidation, the pipeline commenced operations in August 1878, exposing the first small chink in Standard Oil’s armor.

The second, far more threatening project, led by Byron Benson, envisaged a pipeline to the seaboard, a revolutionary development in long-distance transport. Before this time, pipelines had never covered more than thirty miles. This seaboard pipeline would eclipse the railroads and shatter the whole complex structure of secret rebates and drawbacks that Rockefeller had cobbled together. Before the seaboard-pipeline battle, one could argue that Standard Oil had been an innovative force, modernizing the industry through up-to-date plants, superior management, and smoother coordination of the oil flow from wellhead to consumer. Now, it became a benighted custodian of the status quo, squelching progress to safeguard its own interests.

At first, the independents (acting through the Tidewater Pipe Line Company) contemplated running a line from Oil Creek to Baltimore, but J. N. Camden quickly dealt a mortal blow to this plan: He bought an exclusive pipeline charter in the Maryland legislature that carried an ironclad guarantee that no other company would receive a charter that session. The Standard Oil hierarchy in Cleveland was kept closely apprised of his underhanded activities. Of the substantial money needed to grease this shady deal, Camden told Flagler: “The price is nominally \$40,000.”<sup>25</sup>

Foiled in crossing Maryland, the Tidewater Pipe Line Company then opted for a 110-mile pipeline from Bradford to Williamsport in central Pennsylvania, where the oil would then journey east by the Philadelphia and Reading Railroad. On November 22, 1878, it began its great race to the sea,

laying down a ribbon of pipe at a rapid rate of two miles a day. Since the whole concept was experimental—nobody knew if oil could be pumped over 2,600-foot mountains—the Standard Oil cognoscenti reacted with cynical snickers. Writing to Rockefeller, a smug John D. Archbold professed himself “greatly amused” by the “seaboard scheme.”<sup>26</sup> Rockefeller was dubious yet circumspect, predicting at one point, “They are quite likely to have some disappointments yet, before consummating all their plans in that direction.”<sup>27</sup> The Tidewater people mobilized powerful financial interests, and two Wall Street tycoons, George F. Baker and Harris C. Fahnestock of First National Bank, aided them financially.

The fierceness of Standard Oil’s response was previewed in one of O’Day’s first letters to Rockefeller about the mavericks. “I would have no mercy on them that don’t deserve nor appreciate it.”<sup>28</sup> In combating this challenge, Rockefeller again showed himself a virtuoso of industrial warfare. He sent his underlings to tank manufacturers, warning them not to deal with Tidewater, and deluged tank-car manufacturers with orders that kept them busy, depriving the pipeline of rolling stock needed to transport construction materials. Refiners who used Tidewater were lured away with concessionary rates on Standard Oil pipelines, and Rockefeller swiftly bought up any remaining independent refineries that might be prospective Tidewater customers.

Standard Oil also embarked on a real-estate spree of monumental proportions, buying up strips of land or “dead lines” that ran in a straight line from the northern to the southern border of Pennsylvania, to block the Tidewater’s advance. Overnight, bewildered farmers became rich by selling parcels for extravagant sums to Standard Oil agents who invaded their sleepy towns. In another tack, Standard Oil placed stories in local papers, warning farmers who sold to Tidewater that their crops would be spoiled by pipeline leaks. And Standard Oil conspired with the railroads to withhold permission from any pipeline wishing to cross their tracks. Quick to exploit this, O’Day told Rockefeller, “The Penna R.R. should be informed of the efforts that are being made towards laying pipe lines from the Bradford District and they should see to it that the right of way secured some time since in their interest ‘across the country’ is well guarded and watched.”<sup>29</sup>

Still, Tidewater pushed relentlessly ahead. When Standard Oil bought an entire valley at one point, the unstoppable Tidewater changed course and climbed up over the surrounding hills. It began to look as if it might actually outflank Rockefeller and his resolute henchmen. Right on the eve of Tidewater’s success, Rockefeller decided that he might recoup in the political arena what he was on the verge of losing in the economic sphere. It was in the last-minute effort to halt Tidewater that Standard Oil first resorted to the wholesale bribery of state legislators.

Before wading into the muck of Standard Oil’s political operations, we should note the general squalor of business-government dealings in the Gilded Age. Rockefeller had emerged in a fluid business world, with little government regulation to check entrepreneurs. At the same time, the government was heavily involved in the economy as it awarded land grants, railway franchises, and bank charters. After the Civil War, Washington hotels were crammed with businessmen jockeying for government contracts and toting suitcases full of cash to obtain them. President Grant admired the industrial captains, aspired to their society, and assembled a cabinet full of cronies and mediocrities eager to do their bidding. Government degenerated into a sink of iniquity, reflected in Mark Twain’s witticism at a contemporary banquet, “There is a Congressman—I mean a son of a bitch—But why do I repeat myself?”<sup>30</sup> In 1876, politics touched a new nadir when Rutherford B. Hayes defeated Samuel J. Tilden for the presidency in what is now commonly regarded to have been a stolen election. A tremendous amount of money changed hands as businessmen and legislators trafficked in mutual manipulation. Businessmen such as Rockefeller preferred to think of themselves as victims of political extortion, not as initiators of bribes. Yet despite decades of categorical denials, Rockefeller’s papers reveal that he and Standard Oil entered willingly into a staggering amount of corruption. (We should remark in passing that Allan Nevins, who had access to Rockefeller’s papers, somehow managed to document only a single instance of Standard Oil bribery—in the Pennsylvania state legislature in 1887.) Standard Oil officials betrayed no qualms about paying bribes, and there is no recorded instance of Rockefeller rebuking a subordinate for engaging in graft.

During the Tidewater battle, Standard lobbied hard to perpetuate the system that allowed state legislatures to grant exclusive pipeline charters. Representing independent producers, reformers in the late 1870s introduced measures in several states to enact free-pipe bills, which would enable Standard Oil foes to lay competing lines and enjoy the right of eminent domain; under the existing system, Tidewater had to buy costly rights-of-way along its 110-mile east-west route. Standard Oil regarded these bills with such apprehension that Henry Flagler returned from Florida, where he was recuperating from poor health, to spearhead the lobbying campaign. To foster the impression of a popular groundswell against the bill, he hired lawyers to pose as incensed farmers and landowners in favor of the status quo. Flagler and A. J. Cassatt secretly exchanged drafts of the Pennsylvania bill and killed it with crippling amendments.

To stifle a similar pipeline bill in New York, Flagler coordinated efforts with Hugh J. Hewett of the Erie Railroad. Payoffs were an expensive business, and even Standard Oil welcomed rich partners to ease the burden. At one point, Flagler grumbled to a railroad leader, “We have spent a large sum of money to squelch Seaboard Pipe Line Charters,” and he sourly asked that the railroads pick up the tab for these “lobbying” efforts in the future.<sup>31</sup> When Flagler recruited an Albany lobbyist, aptly named Smith M. Weed, he was ready to distribute \$60,000 to legislators, but Hewett demurred and insisted that \$15,000 would suffice.<sup>32</sup> “I send \$10,000 currency,” Flagler agreed, adding, “if you need the other \$5000 or any part of it, send word by bearer and (we or he) can get it for you.”<sup>33</sup> That \$15,000 would today be worth \$220,000.

As always, Rockefeller floated serenely above the bustle, pretending to be oblivious to any wrongdoing, but his correspondence implicates him directly in this skulduggery. On March 4, 1878, A. N. Cole, a New York state senator, wrote to Rockefeller on New York State Senate stationery and presented himself as an “attorney” to be hired by Standard Oil to manage the campaign against the free-pipe bill. Evidently, Rockefeller responded favorably to this overture, for Cole then mapped out an extensive campaign of pressure and subornation, complete with precise money-laundering instructions:

*Two or three good attorneys will be wanted in the Senate, and five or six in the Assembly, and these I have no hesitation in undertaking to employ, if authorized to do so. . . . Government bonds are better to deal in than money, since, were “attorneys” to be paid in cash, it might be construed into corruption, but then one can sell bonds, you know, in fact, dealing in them is an eminently becoming business. . . . In Heaven’s name, don’t make this letter public, since, were you to do so, I fear my brethren of the Methodist Church might fear I had so far fallen from grace as to leave no hope of recovery.*<sup>34</sup>

While Standard Oil conducted statehouse offensives against free pipelines, it also put out brushfires in Washington as public sentiment began to lean toward railroad reform. The electorate was beginning to realize that big-business domination of the transportation network was incompatible with a competitive economy. In 1876, a bill was introduced in Congress “to regulate Commerce and prohibit unjust discriminations by Common Carriers.”<sup>35</sup> By this point, J. N. Camden was a West Virginia congressman. Since he also headed the Camden Consolidated Oil Company, covertly owned by Standard Oil, he kept Rockefeller and Flagler minutely informed of legislative developments and swapped messages with them in Standard Oil code. Regarding the railroad bill, Camden assured Flagler, “I have the ear of some half dozen Senators that I will see. I can’t think there is the least probable danger of such a bill getting through the Senate.”<sup>36</sup> True to Camden’s words, the railroad bill passed the House of Representatives then faltered in the Senate.

By the late 1870s, as news of his wealth spread, Rockefeller was badgered for campaign contributions, sometimes by the same politicians who lambasted Standard Oil. When Ohio representative James A. Garfield ran for president in 1880, he sounded out a Cleveland source, Amos Townsend, as to whether “Mr. Rockefeller” might be sympathetic. When Garfield asked, “Do you know his state of feeling toward me?” Townsend advised extreme caution. “It would not do for him to visit us, as it would be reported and *cut* like a *knife* in Pennsylvania.”<sup>37</sup> A more subtle approach was another matter, and Rockefeller, along with Jay Gould, Chauncey Depew, and Levi Morton, ended up a top contributor to Garfield’s victorious campaign. Garfield was the first of many presidential contenders who grappled with the quandary of whether it made better sense to court Rockefeller’s money or capitalize on public animosity against him.

For all his success in bottling up pipeline bills, Rockefeller couldn’t scotch the Tidewater. As the project neared completion, he executed a flurry of last-minute maneuvers and even tried to buy an interest in the operation for \$300,000—all to no avail. On May 28, 1879, the Tidewater people held their breath as the great pumps whirled into motion near Bradford and the oil began to slide eastward through the pipeline. Nobody knew if the crude oil would actually scale the intervening mountains, and for days people expectantly tracked its slow progress. After seven days of suspense, the first oil drops sputtered out the Williamsport end and led to jubilation in western Pennsylvania, where Tidewater promised deliverance from the Standard Oil monopoly. Construction of the pipeline rated as one of the supreme engineering feats of its day, and its impresario, Byron Benson, achieved heroic status.

Faced with a rare defeat, Standard Oil did not react with equanimity. Daniel O’Day wanted to resort to thuggery to smash the pipeline. “I feel extremely satisfied that the Tidewater Pipe Line can be stopped and torn up if it is thought best to do it,” he told Rockefeller. “I also think that the sooner the Tidewater knows this the better, as it might have a healthy effect upon them.”<sup>38</sup> Rockefeller vetoed such crude reprisals and conceived a more elegant solution to the Tidewater menace. He had to bide his time, though, because he first had to dispose of two legal challenges that dogged his footsteps throughout 1879.

Some of Rockefeller’s critics weren’t content to expose him but wanted to put this pious churchgoer and Sunday-school superintendent behind bars. The producers were still seething from the immediate-shipment controversy and Standard Oil’s refusal to store their surplus oil. One upshot was that on April 29, 1879, a grand jury in Clarion County, Pennsylvania, indicted nine Standard Oil officials—including Rockefeller, Flagler, O’Day, and Archbold—and charged them with conspiracy to monopolize the oil business, extort railroad rebates, and manipulate prices to cripple rivals. Those who resided in Pennsylvania, such as Warden, Lockhart, and Vandergrift, were arrested and released on bail while those, such as Rockefeller, who lived outside the state were able to evade prosecution. Reformers who stalked the Standard knew they had to get Rockefeller or Flagler on the stand, for many top executives were kept in the dark about the organization’s intricate inner workings. When Captain Jacob J. Vandergrift testified at an Ohio hearing that spring, for instance, Flagler was able to reassure Rockefeller: “If it is a question of railroad freights, and discrimination in them, my judgment is [Vandergrift] knows nothing, or if knowing will not be compelled to answer.”<sup>39</sup>

In spring 1879, Rockefeller began a thirty-year career as a fugitive from justice, learning to stay nimbly ahead of the law. For all his scoffing about the Clarion County indictments—“This case will never be brought to trial”—he took no chances.<sup>40</sup> Afraid of being extradited from New York, Rockefeller asked Chauncey Depew, the attorney for the New York Central, to approach New York governor Lucius Robinson, who agreed to deny any such requests from Pennsylvania. At the same time, Rockefeller had A. J. Cassatt approach Pennsylvania governor Henry M. Hoyt with a request that he cease further efforts to haul him into court. To make sure that the Pennsylvania Railroad didn’t double-cross him, Rockefeller boosted production at his Philadelphia refineries serviced by the railroad—a generous bonus that could be canceled at any moment for misbehavior. Meticulous in such maneuvers, Rockefeller made sure to leave no fingerprints and told Captain Vandergrift that it was “of utmost importance that nobody knows of [Standard Oil’s] thought of doing something about [the suit] outside the [Clarion] County.”<sup>41</sup>

From the outset, Standard Oil defendants saw an advantage in the Clarion County affair, which enabled them to refuse to testify at many civil proceedings by claiming it might harm them in the criminal case. Nevertheless, Rockefeller feared that the Clarion suit might set a precedent and adopted a combative approach. “We are disposed to fight the thing and not be subject to this blackmailing process always,” he insisted.<sup>42</sup>

At bottom, Rockefeller must have been genuinely alarmed by the impending criminal prosecution, for he decided to placate the producers and cut a political deal. On the day before Christmas 1879, Standard Oil rescinded the immediate-shipment policy and agreed to meet with producers at the Fifth Avenue Hotel in New York. In a historic agreement, Standard Oil renounced—or *seemed* to renounce—the use of secret rebates and drawbacks and consented to publicly posted freight rates; its United Pipe Lines would no longer discriminate among shippers and would transport all oil within reasonable limits. In return, the criminal and civil cases against Standard Oil in Pennsylvania were scuttled. In time, it emerged that Standard’s pledge to repudiate rebates was largely a rhetorical flourish to settle the cases.

Aware that Standard Oil’s fate was now being thrashed out in the political arena, Rockefeller reversed a long-standing prejudice and took shares in two Cleveland newspapers, investing \$5,000 in the *Herald* and \$10,000 in the *Leader*, explaining to Colonel Oliver Payne that since “Mr. Flagler felt perhaps we had given too little heed to influences of this kind, I decided best to do it.”<sup>43</sup> While Rockefeller’s official policy remained one of obdurate silence, he now had more avenues of press access than he admitted. Payne, meanwhile, believed that Standard Oil should move from bribing politicians

to controlling them directly, telling Rockefeller, apropos of the Ohio legislature, “I wish to say that I have got through with sentiment in politics. . . . We must see hereafter that there is one man in the Legislature from this County that has brains, influence and is our man.”<sup>44</sup> Rockefeller told Payne to do “all that is necessary.”<sup>45</sup>

Around this time, Rockefeller recruited to the Standard legal staff Roger Sherman, who had masterminded the producers’ case against him. For years a champion of Oil Creek, Sherman had fought valiantly to imprison Rockefeller. Now Rockefeller was wily enough to offer him a job, and Sherman was naïve enough—or original enough—to accept it. Always proud of his persuasive powers, Rockefeller took special pleasure in wooing opponents whom he had learned to appreciate by tracking their ploys against him. When a lawyer named Virgil Kline won two lawsuits against him in the 1880s, Rockefeller invited him to his office. “Mr. Kline,” he said, “you have given us a good licking. Now I would like to have you come and work for me.”<sup>46</sup> Kline agreed and became a long-standing member of the Standard Oil legal staff.

Things worked out differently for Roger Sherman, who realized after a strangely inactive year on the payroll that Rockefeller had given him a five-year contract expressly to neutralize him. When he tried to wriggle free of the contract, he was able only to strike a compromise that allowed him to resume his general practice in western Pennsylvania while remaining on retainer to Standard Oil. When he later returned to the crusade against Rockefeller, the independents were too disenchanted by his flirtation with Standard to deal with him. True to his wishes, Rockefeller had tarnished Sherman, separating him from his onetime admirers.

Ever since his boyhood as the son of the town pariah, Rockefeller had evinced more than a trace of paranoia. Now, embattled in courts and legislative chambers, he was convinced that evildoers were plotting against him and complained to one colleague about “this iniquitous proceeding of getting the United States out with a drag-net for the Standard Oil Co.”<sup>47</sup> As chief instigator of his misery, he cited George Rice, an independent refiner, who would pursue him with the tenacity of a harpy for decades.

Rockefeller’s movements in 1879 were governed largely by the need to duck subpoenas. In July, the New York State Assembly held hearings, chaired by Alonzo Barton Hepburn, to probe clandestine relations between the railroads and various industries. While the panel examined flour millers, meatpackers, and salt makers, it zeroed in on Standard Oil as the most notorious beneficiary of back-scratching with the railroads. That summer, Rockefeller stayed at Forest Hill, safely beyond the committee’s reach.

As was true of many exposés of Rockefeller, the Hepburn hearings fueled public indignation against him while it also inadvertently enhanced his mystique as an invulnerable genius. The committee trotted out William H. Vanderbilt, who paid resounding tribute to the disciplined craft of the Standard Oil executives. “Long ago I said if the thing kept on the oil people would own the roads. . . . These men are smarter than I am a great deal. They are very enterprising and smart men. I never came into contact with any class of men so smart and able as they are in their business.”<sup>48</sup>

John D. Archbold’s testimony previewed the manner—flippant, arrogant, glib, and high-handed—in which he disposed of future legal challenges to Standard Oil’s authority. Asked about his functions as a director, Archbold retorted, “I am a clamorer for dividends. That is the only function I have in connection with the Standard Oil Company.”<sup>49</sup> He blatantly perjured himself when he said that Standard didn’t control Acme Oil Company. When chairman Hepburn asked him to return for further questioning the next day, Archbold dismissed the committee, instead of the other way around. “I have given today to the matter,” he told them. “It will be impossible for me to be with you again.”<sup>50</sup> For the most part, Standard officers dodged questions with the ritual evasion, “I refuse to answer on the advice of counsel.”<sup>51</sup>

When the Hepburn report was issued, it lent credence to what might otherwise have seemed fantastic conjecture, documenting a pattern of pervasive railroad favoritism toward large shippers. The New York Central alone enforced six thousand secret contracts, while the Erie’s business was equally honeycombed with privileged arrangements. The committee assailed Standard Oil as “a mysterious organization whose business and transactions are of such a character that its members decline giving a history or description of it lest this testimony be used to convict them of a crime.”<sup>52</sup>

For years, refiners had debated whether railroads were unregulated enterprises, free to strike what bargains they pleased, or common carriers, committed to treat all alike. The Hepburn report buttressed the latter view, saying that railroad bias toward Standard Oil was “the most shameless perversion of the duties of a common carrier to private ends . . . in the history of the world.”<sup>53</sup> To remedy this, the New York legislature set up a railroad commission to regulate rates in a fair, uniform manner. The Hepburn report, however, was both belated and insufficient in hobbling Rockefeller’s triumphant march, for by this time he had parlayed his secret railroad contracts into preeminence in oil. More important, his firm had now advanced far beyond the railroads to more efficient pipelines. In fact, a cynic might argue that the advent of the Hepburn hearings was incontestable proof that the railroads no longer mattered.

The growing agitation over railway reform hardened Rockefeller’s determination to bring the Tidewater pipeline to bay, and he began to harass his competitor with a bewildering array of challenges. He tried to throttle the pipeline’s access to crude oil and explored the purchase of several New York refineries before they could become Tidewater clients. At one point, he reduced rates on Standard Oil pipelines while the railroads dropped prices to such risible levels that one freight agent said that they scarcely covered the wheel grease. This relentless price war forced Tidewater to operate at half capacity.

It turned out that Rockefeller’s adversary, Byron Benson, was no more enamored of free markets than Rockefeller was and had created the pipeline to join in the feast. In March 1880, Daniel O’Day chanced to meet Benson on a train traveling from Oil City to Bradford and was shocked by his rival’s words. As O’Day reported to Rockefeller, “[Benson] told me that he wanted to ‘let the bars down,’ as he expressed it, for any overtures that might be made to his company, with a view of an adjustment of the pipe line questions. He said that he felt that the time had about come when the companies should work together with a view of preventing other companies from engaging in the business.”<sup>54</sup> Benson’s solution suited Rockefeller just fine: Tidewater, instead of cutting rates to compete with the railroads, would collude with them to raise rates. Thus, within a year of its completion, the pipeline that was supposed to emancipate independents from Standard Oil bondage was drawn into a railroad pool supervised by John D. Rockefeller. In 1882, when Byron Benson decided to borrow two million dollars to expand Tidewater, it prompted vigorous opposition from a group of minority

shareholders. Exploiting this dissension, parties friendly to Standard Oil bought the minority stake, enabling Rockefeller to strike a bargain with Tidewater the following year. Under this pact, Standard Oil divided the pipeline business in Pennsylvania, taking 88.5 percent of the trade and leaving just 11.5 percent to Tidewater.

It was now abundantly clear to Rockefeller that the railroads represented a fading order. For a long time, he had resisted an irreversible shift to pipes for fear of antagonizing the railroads, but this concern had lost its force. When Standard Oil constructed four pipelines from western Pennsylvania to Cleveland, New York, Philadelphia, and Buffalo, he pressured the railroads to grant it right-of-way concessions, even though the pipelines signaled their doom.

When Standard Oil subdued Tidewater, it again demoralized the independents and suggested that all opposition to the behemoth was a foolish, chimerical dream. While a band of intrepid reformers continued to joust with Standard Oil in courthouses and legislatures, most producers now surrendered hope of any improvement in their plight. They knew they would either have to quit the business or swallow their pride and make peace with the oil giant. With the passing of Tidewater’s complete independence, they could no longer ship oil from Pennsylvania without paying tribute to the all-powerful Mr. Rockefeller.

## Seat of Empire

When John D. Rockefeller turned forty on July 8, 1879, he was already numbered among America's twenty richest men, yet he was likely the most obscure of the pantheon. While this resulted largely from his aversion to publicity, it also stemmed from his residing in Cleveland. As one chronicler said of the town, "Its rich folk were not scandalous or showy; its politics had not the violent quality essential to American fame."<sup>1</sup> In other words, it was an ideal place for a reclusive magnate. Throughout his career, Rockefeller pooh-poohed "exaggerated" press estimates of his wealth, yet they often understated his true worth. In the late 1870s, one newspaper pegged his wealth at more than \$5 million, when his Standard Oil stock alone was by then worth \$18 million, or \$265 million in 1996 dollars. By comparison, when America's richest citizen, Commodore Vanderbilt, died in 1877, he left an estate valued at nearly \$100 million.

Photos of Rockefeller from this period show two contrasting faces. In his serious mode, his expression seemed grim and unsmiling, with tremendous force in his gaze but no softness or joy. Yet when photographed in leisure hours in the sanctuary of Forest Hill, he looked trim and whimsical, surprisingly boyish for such a powerful man. Gone were the old side-whiskers, but he still had a full red mustache and sandy brown hair. In a period when moguls prided themselves on their embonpoint, Rockefeller was as lean as a greyhound. And at a time when top hats and watch chains were de rigueur for any self-respecting plutocrat, Rockefeller generally conformed to the requisite style, but his family constantly had to remind him to buy a new suit when his current one got too shiny.

If Rockefeller generally enjoyed excellent health, there were early warning symptoms of the toll taken by the excruciating pressures of Standard Oil. In 1878, he wrote to Eliza, "I am eating celery which I understand to be very good for nervous difficulty."<sup>2</sup> Colleagues plied him with advice to take more vacations and spend more time away from business, even though Rockefeller later said he was almost semiretired at this point. He tried to spend as many afternoons as possible at Forest Hill in "the bracing air of Lake Erie."<sup>3</sup> He displayed a strong interest in herbal medicines and other folk remedies, advising one associate that he could dispense more easily with tobacco if he had an orange peel before breakfast every day. Big Bill's interest in medicine, conventional and otherwise, began to surface in his son and became more pronounced with time.

Now that Rockefeller headed almost all of America's oil refineries and pipelines, the press belatedly awakened to his existence, acknowledging him as a new deity in the industrial firmament. In November 1878, he sat for his first full-length newspaper profile in the *New York Sun*. The article disclosed the scope of an ambition that Rockefeller took pains to deny: "The people of Cleveland say that it is his ambition to become the richest man in Ohio and one of the ten richest men in the United States. . . . He is in a fair way of being able to count on his fingers the men in the country who are richer than he is."<sup>4</sup> This first sketch, which portrayed him as quiet, reserved, and methodical, was shot through with ambivalence. Of Rockefeller's business ability, the reporter rhapsodized: "Business men in Cleveland, in the oil regions and in New York who know him or know of him, regard him as one of the great commercial intellects of the country."<sup>5</sup> Yet the article concluded that his Olympian success arose from a strange, unsavory bargain with the railroads—a pact that people surmised but could never quite prove. Within a year, the Hepburn hearings began to document what had long been mooted about Rockefeller's dealings with the railroads, and by the early 1880s he had moved a considerable distance from his former anonymity to something closer to universal notoriety.

In late 1883, Rockefeller's life assumed a marginally higher profile when he moved to New York. Eighteen eighty-four would prove to be a pivotal year for the country, marked by bank failures and panics and the demise of General Grant's brokerage firm, Grant and Ward. The Democratic reformer Grover Cleveland triumphed in the presidential election over the corrupt Republican candidate, James G. Blaine, installing a Democrat in the White House for the first time in many years.

Rockefeller had long felt the gravitational pull of New York, with its lively export trade in kerosene, and routinely spent part of each winter there. Haunted by his father's wanderings, he was loath to abandon Cettie and the children, and for two winters in the mid-1870s he lodged them at the Windsor Hotel on Fifth Avenue, where Jay Gould often plotted his corporate raids. From 1877 to 1884, Rockefeller and his family stayed at the Buckingham Hotel, a residential hotel on Fifth Avenue on the present site of the Saks department store. They had a large suite of rooms in the shadow of Saint Patrick's Cathedral, whose huge stained-glass windows loomed up dreamily outside their windows at night. (One of Junior's early memories was of being reprimanded sharply by his mother for failing to thank a hotel waiter for bringing him food.) After Harvey Spelman's death in 1881, Grandmother Spelman and Aunt Lute took a suite on the same floor and shared meals with them. From late spring through early fall, the entourage returned to Forest Hill, where Rockefeller stayed in touch with the New York office by sophisticated telegraphy.

Business now dictated Rockefeller's move to the East Coast. In an age of long-distance pipelines, huge volumes of crude oil were flowing to seaboard refineries where they fed a flourishing export traffic, relegating Cleveland and other inland centers to an inferior status. Responding to the export boom, Standard Oil established sprawling refineries in Brooklyn, Bayonne, Philadelphia, and Baltimore. A latent tension now strained relations between the Cleveland headquarters and its burgeoning New York branch. One day, Benjamin Brewster, a Standard director, told Rockefeller that a two-headed calf belonged only in the circus and that the combine needed a single head. "You can't have one head in Cleveland and another in New York," he told Rockefeller. "And therefore either you have got to quit Cleveland and come on here or we have got to pack up and leave New York and go out to Cleveland."<sup>6</sup>

By the time Rockefeller and Oliver Payne transferred to New York in late 1883 and early 1884, Henry Flagler had preceded them by two years. Though now immensely rich, John and Cettie possessed the low-key style and resolute sense of privacy of old money and searched for a house on a peaceful side street. They swapped nine parcels of Manhattan real estate, appraised at \$600,000, for a four-story brownstone mansion at 4 West Fifty-fourth Street. Garlanded with ivy, flanked by lawns, the residence stood on a site that would later house the Museum of Modern Art sculpture garden. If roomy and comfortable, it was extremely modest for someone of Rockefeller's wealth and, like his Cleveland residence, subtly masked the size of his fortune. For all its social cachet, Fifth Avenue was now a busy, nerve-jangling thoroughfare, as Junior remembered with dismay: "It was paved with

cobblestones and I can still hear the noise of the steel tires rumbling along the street. It was fearfully noisy.”<sup>7</sup> By contrast, West Fifty-fourth Street was a shady retreat, situated north of the Elgin Botanical Gardens, which later formed part of Rockefeller Center. Opposite the Rockefeller home stood Saint Luke’s Hospital, with lawns and gardens that spread a fragrant tranquillity over the street.

The home that the Rockefellers bought was the opulent boudoir of the beautiful Arabella Worsham, who had tried to pass herself off as a niece of railroad mogul Collis Huntington when she was actually his mistress. When Huntington’s wife died in late 1883, he decided to marry Arabella and make an honest woman of her. The sober brownstone that had sheltered their assignations went on the market, and it is amusing to think of the Rockefellers snapping up their love nest. A frugal man, John D. followed his accustomed practice of keeping the furnishings, even if the style in this case diverged ludicrously from his own. The interior contained touches of voluptuous sensuality, such as Arabella’s exotic Moorish salon on the ground floor and the Turkish bath upstairs. The sumptuous master bedroom was artistically designed in Anglo-Japanese style, with dark ebonized woodwork, a queen-size canopied sleigh bed, and a magnificent silver and gilt chandelier. The bay window provided an intimate Turkish corner, tantalizingly glimpsed through a stained-glass screen. Doubtless as a legacy of Arabella Worsham—one can’t picture the prudish Rockefellers shopping for such things—4 West Fifty-fourth Street had paintings by Corot, Meissonier, Daubigny, and other French painters then in vogue among local parvenus. The house also had the latest conveniences, including one of the city’s first elevators in a private residence. The only thing removed by Rockefeller were the worn carpets, which he donated to the needy through a local church.

Though West Fifty-fourth Street was a tree-lined oasis, the Rockefellers had chosen the most sybaritic precinct of New York society in the Gilded Age. Much of the wealth amassed in what Mark Twain called the “raging, tearing, booming nineteenth century” had now settled in Manhattan. The old New York aristocracy, huddled around Washington Square and Gramercy Park, shuddered at the pretentious uptown mansions, which paid tribute to postwar fortunes in railroads, steel, and oil. Along Fifth Avenue near the Rockefeller home, the palaces of the rich—notably the fantastic, turreted confections of William K. Vanderbilt at Fifty-first Street and Cornelius Vanderbilt II at Fifty-eighth Street—stretched uptown in gaudy profusion.

With Standard Oil moving its headquarters to New York, the neighborhood was becoming a colony of company directors. At one point in this corporate relocation, twenty-eight Standard Oil executives arrived in a single Pullman car from Cleveland and were taken straight to the Saint James Hotel, where William presided over their first breakfast and John their first dinner. The latter liked to greet new arrivals at the train station and help them to find houses. Soon, the Fifth Avenue strip near Rockefeller’s home was thickly populated with Standard Oil men, Henry Flagler occupying the southeast corner of Fifty-fourth Street and William Rockefeller the northeast corner, with Benjamin Brewster next door to William. William departed from his brother’s ascetic style and raised his children in a looser, freer atmosphere, causing envious pangs among John’s children. As Junior said, “We children didn’t have what those children had and we used to notice the difference. They had a gay kind of social life, with many parties which we used to wish we could have.”<sup>8</sup> Since William refused to take on debt to build his house, he sold \$50,000 of Standard Oil stock to John despite his brother’s heartfelt plea to retain the stock. William’s imprudent decision figured importantly in the enormous disparity in wealth that developed between the two brothers.

In New York, John D. did not acquire cosmopolitan interests but stuck with his old Cleveland pastimes, creating a large ice-skating rink every winter in a space adjoining his house. Each morning, curious pedestrians could glimpse the chief of the American oil industry, dressed in overcoat and top hat, ice skates strapped to his patent-leather boots, as he glided placidly around the horseshoe-shaped area. A great enthusiast for the sport, he created rows of shelves in his house on which dozens of guests could store their skates.

Though Rockefeller resisted the yacht-owning fad that swept New York society in the 1880s and owned neither a boat nor private railroad car, he spared no expense for fast-trotting horses in his large, heated stable at 21 West Fiftyfifth Street. Every afternoon after work, he took out his black gelding trotters and mingled with the pageant of fashionable carriages thronging Central Park, often racing against his brother William, with an excited Junior seated at his side. So keenly did Rockefeller relish trotting that at one point he told his son, “I drove four times yesterday making an aggregate in the two days of about eighty miles. Don’t you think I am an enthusiastic youth?”<sup>9</sup> Junior left a description of his father’s racing style that seems a metaphor for his assertive but careful stewardship of Standard Oil:

*Other drivers would often lose their tempers when a horse broke gait or pulled hard; Father never. If a horse was excitable or difficult he always kept his temper, and patiently, quietly worked with the animal until he steadied it. Frequently I have seen him driving at a very rapid pace through Central Park; in the middle of the roadway through two streams of traffic, pushing always a little to the left, as he explained to me, so as to open his way through, but keeping margin enough on the right so that if the approaching traffic did not swing over in time, he would still have room enough to pass.*<sup>10</sup>

Never dazzled by New York, Rockefeller was insulated from the beau monde that threw costly dinners and costume balls and frequented the theater, opera, and clubs. He had no interest in debauchery, and it is hard to picture him milling about with portly men smoking cigars or women wearing expensive furs and jewels. The newspapers noted his total boycott of social functions. As one periodical said, “He never entertains notables, his home is never given to entertainment, and he follows the policy of self-effacement at all times and in all places.”<sup>11</sup> Although he joined the Union League Club, Rockefeller did not feel comfortable with the splendor of the Astors and Vanderbilts. When Cettie asked for a new four-wheeled carriage in 1882, John stared at her, aghast, and said they could scarcely afford it unless they traded in the old one. Abiding by his daily rituals, he still enjoyed bread and milk in the morning and a paper bag of apples in the evening. Each morning before work, a barber shaved him in his dressing room before he trotted down the brownstone stoop at exactly the same hour and for a nickel took the Sixth Avenue elevated train downtown. The wheels of his mind already turning, he jotted penciled notes on his shirt cuff as the train jolted toward Wall Street. Moving with spectral stealth, as if tiptoeing on a cushion of air, he slipped into the Standard Oil building at the stroke of nine. “I never knew anyone to enter an office as quietly as Mr. Rockefeller,” said his private secretary, George Rogers. “He seemed almost to have a coat of invisibility.”<sup>12</sup>

In late 1883, Standard Oil began to assemble real estate at the southern tip of Manhattan for new headquarters, destined to soar above Broadway at Bowling Green on the onetime site of Alexander Hamilton’s home. Having long outgrown William’s old offices at two different locations on Pearl Street, the firm had operated for three years from modest, unprepossessing quarters at 44 Broadway. Now, on May 1, 1885, after spending nearly one

million dollars on it, Standard Oil moved into its impregnable new fortress, a massive, granite, nine-story building. The combine's name didn't appear outside, just the building number. Twenty-six Broadway soon became the world's most famous business address, shorthand for the oil trust itself, evoking its mystery, power, and efficiency. Standard Oil was now America's premier business, with a reach that ramified into a labyrinth of railroads, banks, and other businesses. The purple prose aroused by the new building perhaps owed less to its imposing neoclassical architecture than to its symbolic heft. Said one reporter: "Many worthy men are convinced that No. 26 Broadway is the most perilous shelter on earth—a cave for pirates, a den for the cutthroats of commerce."<sup>13</sup> Otherwise sober writers seemed to swoon before the saturnine grandeur of Rockefeller's seat of power:

*At the lower end of the greatest thoroughfare in the greatest city of the New World is a huge structure of plain gray-stone. Solid as a prison, towering as a steeple, its cold and forbidding facade seems to rebuke the heedless levity of the passing crowd, and frown on the frivolity of the stray sunbeams which in the late afternoon play around its impassive cornices. Men point to its stern portals, glance quickly up at the rows of unwinking windows, nudge each other, and hurry onward, as the Spaniards used to do when going by the offices of the Inquisition. The building is No. 26 Broadway.*<sup>14</sup>

Reporters who managed to slip past the watchful guards found a world at odds with the grim exterior, a dignified place with mahogany rolltop desks and mustard-colored carpets. The subdued atmosphere—people instinctively conferred in hushed tones—mirrored Rockefeller's own personality. Rockefeller's office faced south and east, with a spectacular view of New York harbor. As one reporter commented, "There is an absence of bustle and noise. While transactions involving millions may be involved, the negotiations are conducted in a quiet methodical manner, apparently free from excitement."<sup>15</sup> The offices had some unusual security features, including ground-glass partitions that reached to the ceiling and obscured the proceedings within. In a quintessential Rockefeller touch, the doors were equipped with special secret-rim locks: One had to know how to twist the rim with thumb and forefinger before turning the knob, so that an intruder could find himself suddenly trapped in a maze of ostensibly locked doors.

In these new quarters, the Standard Oil mandarins preserved a tradition launched years before. Each day at noon, the executive committee gathered for lunch in a top-floor room decorated with hunting and fishing trophies and with a port view that suited their global empire. There was no surer proof of favor in the Standard Oil empyrean than to receive an invitation to dine at the long table. Arriving in silk hats, frock coats, and gloves, the directors always took the same assigned seats. In his deceptively self-effacing style, Rockefeller yielded the head of the table to his most frequent adversary, Charles Pratt, who was the group's oldest member; Flagler sat to Pratt's right, then Rockefeller, then Archbold. It says much about his managerial approach that Rockefeller sat indistinguishably among his colleagues, though the leveling arrangement scarcely disguised his unique status. As philosopher Herbert Spencer once said, "A business partnership, balanced as the authorities of its members may theoretically be, presently becomes a union in which the authority of one partner is tacitly recognized as greater than that of the other or others."<sup>16</sup>

Few outsiders knew that one of Rockefeller's greatest talents was to manage and motivate his diverse associates. As he said, "It is chiefly to my confidence in men and my ability to inspire their confidence in me that I owe my success in life."<sup>17</sup> He liked to note that Napoleon could not have succeeded without his marshals.<sup>18</sup> Free of an autocratic temperament, Rockefeller was quick to delegate authority and presided lightly, genially, over his empire, exerting his will in unseen ways. At meetings, Rockefeller had a negative capability: The quieter he was, the more forceful his presence seemed, and he played on his mystique as the resident genius immune to petty concerns. As one director recalled, "I have seen board meetings, when excited men shouted profanity and made menacing gestures, but Mr. Rockefeller, maintaining the utmost courtesy, continued to dominate the room."<sup>19</sup> Sometimes, he dozed on a couch after lunch. "I can see him now," one executive recalled, "lying back on a lounge at a directors' meeting, eyes closed taking it all in. Now and then he'd open his eyes and make a suggestion."<sup>20</sup>

Rockefeller placed a premium on internal harmony and tried to reconcile his contending chieftains. A laconic man, he liked to canvass everyone's opinion before expressing his own and then often crafted a compromise to maintain cohesion. He was always careful to couch his decisions as suggestions or questions. Even in the early days, he had lunched daily with brother William, Harkness, Flagler, and Payne to thrash out problems. As the organization grew, he continued to operate by consensus, taking no major initiative opposed by board members. Because all ideas had to meet the supreme test of unanimous approval among strong-minded men, Standard Oil made few major missteps. As Rockefeller said, "We made sure that we were right and had planned for every contingency before we went ahead."<sup>21</sup>

Even though Rockefeller feuded sporadically with Charles Pratt, Henry Rogers, and others, the firm was free of the petulant bickering and bureaucratic jealousy that usually accompany vast power. At least to hear Rockefeller tell it, the directors—former foes who had banded together in corporate brotherhood—were bound by an almost mystic faith. For him, their belief in each other explained their cohesion and certified their virtue. "Crooked men cannot be held as these Standard Oil Company men were held for all this long term."<sup>22</sup> The continuity of leadership made the firm all but impervious to snooping reporters and government investigators, who could never penetrate the tight-knit phalanx of like-minded men who ran the oil empire for four consecutive decades.

The unity of the Standard Oil partners was especially impressive given the organization's byzantine structure, a far-flung patchwork of firms, each nominally independent but in reality taking orders from 26 Broadway. In the absence of a federal incorporation law, Rockefeller, like other contemporary businessmen, had to cope with a tangle of restrictive laws that made it fiendishly difficult to run an interstate company. As he said, "Our federal form of government, making every corporation created by a state foreign to every other state, renders it necessary for persons doing business through corporate agency to organize corporations in some or many of the different states in which their business is located."<sup>23</sup> This handicap forced business leaders to devise cunning ways to circumvent laws and led them to corrupt politicians and legislatures; much of Rockefeller's political cynicism issued from this source. For Standard Oil, a national operation from the start, the antiquated legal framework lured it into myriad legal adaptations. But if Rockefeller correctly considered the legal system an unfair impediment, it was also a spur to his ingenuity.

His first major improvisation came with an ingenious trust agreement that was executed privately in 1879. Under its charter, Standard Oil of Ohio couldn't own companies outside the state, so it assigned three midlevel employees—Myron R. Keith, George F. Chester, and George H. Vilas—to serve as trustees who held stock in a score of subsidiaries outside the state. When they received dividends, they distributed them to the thirty-seven investors

of Standard of Ohio *as individuals*, in amounts proportionate to their stakes in the parent company. (Of the 35,000 Standard shares, Rockefeller held nearly 9,000, or three times the amount of Flagler, Harkness, Pratt, or Payne.)<sup>24</sup> This jerry-built structure enabled Rockefeller to swear under oath that Standard Oil of Ohio didn't own property outside of Ohio, even though it controlled most of the pipelines and refineries in Pennsylvania, New York, New Jersey, and Maryland; technically speaking, the trustees owned these properties.

The 1879 agreement, a makeshift arrangement, lasted only three years. When the state of Pennsylvania tried in 1881 to tax the property of Standard of Ohio within its borders, Rockefeller feared that other states might copy this precedent and hold him hostage. At the same time, he had absorbed so many new pipelines and refineries that he was struggling to coordinate policy among many scattered units. The time had come to streamline operations, impose guidance, and attain new efficiencies. The brains behind this next stage of development was an affable, roly-poly lawyer and Presbyterian elder named Samuel C. T. Dodd, a man so fat that one wag claimed he was the same size in every direction. As general solicitor of Standard Oil from 1881 to 1905, he was its leading theoretician and publicist, as much ideologist as lawyer. A carpenter's son from Franklin, Pennsylvania, and an amateur poet passionate about classical literature, he had been a vocal, high-minded resident of Titusville. Ironically, as a Democratic member of Pennsylvania's constitutional convention in 1872, Dodd had won attention as a scourge of the railroads, excoriating Rockefeller and the South Improvement Company for taking advantage of rebates.

The way Dodd entered Standard Oil should have tipped him off to the depth of Rockefeller's guile. In 1878, two refiners named Taylor and Satterfield hired him in a dispute against United Pipe Lines, which was ostensibly owned by Vandergrift and Forman. Since Dodd was also a lawyer for Captain Jacob J. Vandergrift, he found himself representing both sides in the case. At one point, Vandergrift made a shocking confession to him: United Pipe Lines actually belonged lock, stock, and barrel to Standard Oil. At the behest of his clients, Dodd journeyed to Cleveland to draw up a mutually satisfactory settlement. As he recalled:

*Here, for the first time, I met John D. Rockefeller, a very pleasant, gentlemanly, unassuming man, but slow in his deliberations and particular as possible at every point of negotiation. Being a little vexed one day at my objection to some clause he desired in the contract which was being drawn, he said in a sarcastic tone: "Mr. Dodd, do you often act for both sides in a case?" I said, "Not often, Mr. Rockefeller, but I am always ready to do so when both sides want an honest lawyer." This seemed to amuse him and we soon brought the matter to a settlement.*<sup>25</sup>

When Rockefeller hired him in 1879, Dodd held out, not for more money or titles but for assurances of his integrity. Taking a relatively small salary (it would never exceed \$25,000 a year), he resisted Rockefeller's plea that he take Standard Oil stock, arguing that this might compromise his legal judgment, and he never became a Standard director for that reason. He also emphasized that he would never alter his settled views on the injustice of railroad rebates. To all these conditions, Rockefeller assented breezily—perhaps too breezily. As will be seen, he spent years fooling Dodd about Standard Oil's relations with the railroads, to the point that one must conclude that Dodd fairly asked to be duped and suspended all skepticism. After being hired by Rockefeller, Dodd was ostracized by many former clients along Oil Creek. To these critics, he shrugged and said, "Well, as the ministers say when they get a call to a higher salary, it seems to be the Lord's will."<sup>26</sup> Rockefeller bestowed this encomium on Dodd: "A more just man never lived. . . . He was a lovable, loyal man."<sup>27</sup> In many antitrust hearings, Rockefeller looked to the redoubtable Dodd and awaited his nod of approval before answering questions.

Dodd was a wizard at contriving forms that obeyed the letter but circumvented the spirit of the law. As the Keith-Chester-Vilas travesty became known, Dodd studied new organizational structures that might allow Standard to expand business while maintaining centralized control. That the major directors lived in separate cities—mostly Cleveland, New York, Pittsburgh, Philadelphia, and Baltimore—was impeding finely meshed coordination. Dodd came up with a sudden brainstorm as to how to meld intrastate firms into an interstate giant. The first step was to set up a separate Standard Oil company in each state in which it had major interests. As a result, Standard Oil of New York was formed on August 1, 1882, with William Rockefeller as president; four days later, John became president of the new Standard Oil of New Jersey. This stratagem was designed to prevent each state from taxing Standard Oil property located outside the state. Dodd realized that separate companies required separate boards of directors and considered how to prevent a fragmentation of power. The answer, he explained, was that "you could have a common name, a common office, and a common management by means of a common executive committee. The stock could in effect be made common by placing the corporate stock in the hands of Trustees who shall issue certificates of interest in the Trust estate, which certificates will be entitled to their due proportions of the various stock dividends."<sup>28</sup> As Dodd noted, this elaborate stock swap would create a union not of corporations but of stockholders, ensuring that the companies could behave in concert without running afoul of the law.

Dodd and Flagler drafted the new Standard Oil trust agreement, which was dated January 2, 1882. The public knew nothing of this contrivance that spawned a \$70 million enterprise and controlled 90 percent of American refineries and pipelines until it emerged, accidentally, in antitrust hearings six years later. The agreement created a board of nine New York-based trustees—the group that assembled daily for lunch at 26 Broadway. Today, we would term it a holding company, but at the time it seemed an imaginary entity, lacking any real legal existence. It couldn't make deals, sign contracts, or keep books, though it wielded infinite power. It received the stock of Standard of Ohio and forty other companies—twenty-six of them partially, fourteen fully owned—with the power to name their officers and directors. Among the shareholders, the distribution of power and wealth remained lopsided, with Rockefeller holding more than one-third of the trust certificates, a block worth \$19 million. The five members of the Cleveland wing—John and William Rockefeller, Flagler, Payne, and Harkness—retained a commanding majority of shares and formed a pool within the top echelon to buy and sell jointly interests in other companies.

For the first time, the trust's formation created negotiable securities, and this profoundly affected the Standard Oil culture. Not only did Rockefeller urge underlings to take stock but made money abundantly available to do so. As such shareholding became widespread, it welded the organization more tightly together, creating an esprit de corps that helped in steamrolling over competitors and government investigators alike. With employees receiving huge capital gains and dividends, they converted Standard Oil into a holy crusade. Rockefeller hoped the trust would serve as a model for a new populist capitalism, marked by employee share ownership. "I would have every man a capitalist, every man, woman and child," he said. "I would have everyone save his earnings, not squander it; own the industries, own the railroads, own the telegraph lines."<sup>29</sup>

In many ways, Standard Oil's metamorphosis previewed the trajectory of other major American business organizations in the late nineteenth century as they moved from freewheeling competition to loosely knit cartels to airtight trusts. The 1882 agreement introduced the concept of the trust as something synonymous with industrial monopoly. During the 1880s, industrywide pools sprouted in many industries in America, England, and Germany, but their leaders found it difficult to prevent cheating and secret price-cutting among members. Now, Standard Oil came up with a way to introduce centralized control, backed by enforcement powers and managerial direction. So many companies duplicated the pattern over the years that one can say, with pardonable exaggeration, that the 1882 trust agreement executed by Standard Oil led straight to the Sherman Antitrust Act eight years later.

Rockefeller was a unique hybrid in American business: both the instinctive, first-generation entrepreneur who founds a company and the analytic second-generation manager who extends and develops it. He wasn't the sort of rugged, self-made mogul who quickly becomes irrelevant to his own organization. For that reason, his career anticipates the managerial capitalism of the twentieth century.

Since he never owned more than a third of his company, he needed the cooperation of other people. Having created an empire of unfathomable complexity, he was smart enough to see that he had to submerge his identity in the organization. Many people noted that Rockefeller seldom said "I," except when telling a joke, preferring the first-person plural when discussing Standard Oil. "Don't say that *I* ought to do this or that," he preached to colleagues. "*We* ought to do it. Never forget that we are partners; whatever is done is for the general good of us all." <sup>30</sup> He preferred outspoken colleagues to weak-kneed sycophants and welcomed differences of opinion so long as they weren't personalized. In their private deliberations, the Standard executives, for all their swashbuckling reputation, tended to be cordial and formal. As Cleveland Amory said of them, "No group of American tycoons were ever more forbidding or high and mighty publicly or more gentle and shy and retiring privately."<sup>31</sup>

By creating new industrial forms, Rockefeller left his stamp on an age that lauded inventors, not administrators. That he created one of the first multinational corporations, selling kerosene around the world and setting a business pattern for the next century, was arguably his greatest feat. As he said, "Our nation was in a state of transition from agriculture to wholesale manufacture and commerce, and we had to invent methods and machinery as we went along."<sup>32</sup> Whatever the debates about his ethics, economists and historians have unanimously extolled his role as a pioneer of the modern corporation. Despite the legal impediments, he was able to fuse together dozens of disparate firms into a seamless whole. What might have been a cumbersome apparatus developed into an efficient instrument in Rockefeller's hands. Standard Oil led the way in industrial planning and large-volume production, exploiting economies of scale that might otherwise have been hard to achieve at this stage in a purely competitive state. Under Rockefeller's tutelage, the trust made notable strides in improving kerosene, developing by-products, and reducing the cost of packaging, transporting, and distributing petroleum products worldwide. As one biographer has remarked, "Rockefeller must be accepted as the greatest business administrator America has produced." <sup>33</sup> An oil historian echoes this verdict: "Rockefeller was the single most important figure in shaping the oil industry. The same might arguably be said for his place in the history of America's industrial development and the rise of the modern corporation."<sup>34</sup>

The secret to unifying the dozens of affiliated concerns proved to be the committee system patented by Standard Oil. The inner sanctum was the executive committee. Though they recommended actions to field supervisors, they held considerable power in reserve, for they had to approve all expenditures above \$5,000 and salary increases above \$50 a month, enabling them to retard the growth of any unit. Below the executive committee came a battery of specialized committees dedicated to transportation, pipelines, domestic trade, export trade, manufacturing, purchasing, and so on. These committees standardized the quality of subsidiaries engaged in similar work, enabling managers to swap insights and align their operations. As Rockefeller said of this innovation: "A company of men, for example, were specialists in manufacture. These were chosen experts, who had daily sessions and study of the problems, new as well as old, constantly arising. The benefit of their research, their study, was available for each of the different concerns whose shares were held by these trustees."<sup>35</sup> Under the committee system, Standard Oil created a self-sufficient universe, overseeing plants that made acid, chemicals, staves, barrels, wicks, pumps, and even tank cars. It shut down more than thirty obsolete refineries, concentrating more than a quarter of world kerosene production in three monster plants in Cleveland, Bayonne, and Philadelphia.

The committee system was an ingenious adaptation, integrating the policy of constituent companies without stripping them of all autonomy. We must recall that Standard Oil remained a confederation and most of its subsidiaries were only partially owned. A top-down hierarchical structure might have hampered local owners whom Rockefeller had promised a measure of autonomy in running their plants. The committee system galvanized their energies while providing them with general guidance. The committees encouraged rivalry among local units by circulating performance figures and encouraging them to compete for records and prizes. The point is vitally important, for monopolies, spared the rod of competition, can easily lapse into sluggish giants. At Standard Oil, in contrast, as Rockefeller stated, "the stimulus to make the best showing, each concern for itself, led to active and aggressive work in competition."<sup>36</sup>

For many years, Rockefeller had tried to free himself from details and applauded the committee system as relegating him to a fifth wheel. He never attended individual committee meetings but sometimes, in his odd way, dropped by when committee heads conferred. As one member said:

*I have seen Mr. Rockefeller often at a meeting of the heads of the different departments of the Company, listening carefully to each one and not saying a word. Perhaps he would stretch out on a lounge and say: "I am a little tired, but go right on gentlemen, for I know you want to reach a decision." He might close his eyes now and then; but he never missed a point. He would go away without saying a word but good-bye. But next day when he came down he had digested the whole proposition and worked out the answer—and he always worked out the right answer.*<sup>37</sup>

Although Standard Oil encouraged cooperation and allowed strong executives to flourish, Rockefeller retained unrivaled influence. While colleagues embarked on shopping binges to buy palatial homes and European art, Rockefeller husbanded his money. He believed in Standard Oil and gladly purchased all available stock from other directors. "Oh, I was the dumping ground for them all in those days," he once laughed, and his unequalled shareholding gave his opinions extra weight.<sup>38</sup>

Beyond the size of his stake, Rockefeller also possessed an unlikely charisma. He never backslapped, roughhoused, or skylarked with his colleagues, and his statesmanlike calm evoked feelings of awe. As one reporter said in 1905, "No man, however unimpressible he may be, can stand in the

presence of Mr. Rockefeller without feeling the repressed power of the man.”<sup>39</sup> He seemed to possess oracular powers. As Archbold conceded, “Rockefeller always sees a little further than the rest of us—and then he sees around the corner.”<sup>40</sup> Another Standard executive, Edward T. Bedford, paid him this high tribute: “Mr. Rockefeller was really a superman. He not only envisaged a new system of business upon a grand scale but he also had the patience, the courage and the audacity to put it into effect in the face of almost insuperable difficulties, sticking to his purpose with a tenacity and confidence [that were] simply amazing.”<sup>41</sup>

He also had a tactful, easy manner with less exalted employees and never reacted angrily when presented with grievances. Once a year, each employee had the right to appear before the executive committee and argue for a higher salary, and Rockefeller always reacted pleasantly. As one employee recalled, “When H. H. Rogers would say gruffly that he had had enough and we had no right to ask for an increase of salary, Mr. Rockefeller would say, ‘Oh, give him a chance.’”<sup>42</sup> But the mildness was deceiving, for while Rockefeller might sometimes be prepared to pay wages 10 or even 20 percent above the prevailing levels, he would never countenance unions or organized employee protest.

In the last analysis, Rockefeller prevailed at Standard Oil because he had mastered a method for solving problems that carried him far beyond his native endowment. He believed there was a time to think and then a time to act. He brooded over problems and quietly matured plans over extended periods. Once he had made up his mind, however, he was no longer troubled by doubts and pursued his vision with undeviating faith. Unfortunately, once in that state of mind, he was all but deaf to criticism. He was like a projectile that, once launched, could never be stopped, never recalled, never diverted.

Amid the murky temptations of Manhattan, the Rockefeller home was a tranquil island of missionary work, temperance meetings, and prayer vigils. Beset by fears of big-city vice and determined to avoid exposure to liquor, cards, tobacco, and dancing, the Rockefellers still socialized only with kindred spirits. The greater the controversy surrounding Standard Oil, the more decorous their home life.

The family belied John Wesley’s dictum that “wherever riches have increased, the essence of religion has decreased in the same proportion.”<sup>43</sup> The Rockefellers had also figured out how to solve the riddle that John Adams posed to Thomas Jefferson in 1819: “Will you tell me how to prevent riches from producing luxury? Will you tell me how to prevent luxury from producing effeminacy, intoxication, extravagance, Vice and folly?”<sup>44</sup> The fear that wealth would adulterate their values only pushed John and Cettie deeper into church activism and the temperance movement. In 1883, John sat on an advisory committee of the Women’s Christian Temperance Union, which was campaigning for an amendment to the Ohio constitution to outlaw the manufacture and sale of liquor. Though the initiative petered out, he later became a major benefactor of the Ohio Anti-Saloon League and grew steadily more militant in the cause. “I fear unless a great temperance reform sweeps over our whole land, the Republic itself may be imperilled,” he thundered.<sup>45</sup> Among other pet causes of this period, he gave substantial sums to the revivalist Dwight L. Moody and urged Henry Flagler to follow suit.

Right before the Rockefellers left Cleveland, some friends asked Cettie why her children hadn’t been baptized, and she was haunted by the question. She began intensive prayer meetings with her children, which led three of the four—Alta (twelve), Edith (eleven), and John (nine)—to be baptized jointly on October 28, 1883, the last Sunday before their move to New York. Afterward, Cettie recorded her impressions: “It was a beautiful and impressive sight, after the morning service—there were plants and flowers around the baptistry, and a dove suspended over it.”<sup>46</sup> Since the Rockefellers returned to Cleveland each summer, John and Cettie retained their positions at the Euclid Avenue Baptist Church. Upon arriving in Manhattan, they joined the Fifth Avenue Baptist Church and imported the Reverend William H. P. Faunce from Springfield, Massachusetts, to head it. It never occurred to the Rockefellers to trade up to a more socially prestigious denomination. “Most Americans when they accumulate money climb the golden spires of the nearest Episcopal Church,” H. L. Mencken later observed. “But the Rockefellers cling to the primeval rain-god of the American hinterland and show no signs of being ashamed of him.”<sup>47</sup> They would not have felt comfortable with the splendor and formality of a high-church denomination.

After having been taught at home for many years, the Rockefeller children began to venture forth tentatively from their often-stifling family cocoon. Rockefeller said he educated his children at home because he had divided his time between Cleveland and New York for several years, but he also might have wanted to sequester them from forbidden contacts. Bessie, Alta, and Edith now attended the Rye Female Seminary in Westchester County, directed by a Mrs. Life, the former Susan La Monte, who had tutored Rockefeller in his early adolescence in Owego. Though the progeny of one of America’s richest men, the three young heiresses seemed to drift about in a state of perpetual longing. As one intimate companion recollected,

*The allowances given to the children were small. Edith confided to me one day while we were shopping that it was the dearest wish of her heart to have some silk underwear, but that “Mother wouldn’t hear of it.” Alta yearned for a high hat to wear with her riding costume, and when after months of cajoling she finally got it, she had [a] picture taken. . . . Then the dream of her life became riding boots.*<sup>48</sup>

Edith became positively clothes crazy, displaying a craving for fashionable outfits and jewelry in defiance of her parents’ values.

By avoiding talk of money as unbecoming, Rockefeller concealed from his children the magnitude of his fortune. When Bessie enrolled at Vassar in the mid-1880s—she was the only daughter to attend college—she went on a shopping expedition with some classmates to purchase a Christmas present for a favorite teacher. At a Manhattan store, they found the perfect gift: a \$100 desk. Since Bessie and her companions had only \$75, they asked the merchant if he could wait a few days for the remaining \$25. He agreed to do so if a New York businessman would vouch for them. “My father is in business,” Bessie offered meekly. “He will vouch for us.” Who is your father? asked the man. “His name is Mr. Rockefeller,” she said. “John D. Rockefeller; he is in the oil business.” The merchant gasped. “John D. Rockefeller your father!” When he agreed to ship the furniture, Bessie imagined he had merely changed his mind to please them.<sup>49</sup>

When it came time for Junior to dispense with private tutors, he went to the New York School of Languages, followed by a school run by C. N. Douglass, and then the tony Cutler School, whose student body included Albert Milbank, Cornelius N. Bliss, and Cornelius Vanderbilt. Junior trudged the pavement to school each morning while he watched poorer classmates rolling by in fine carriages. Though he belittled his own intelligence, this

bright, dutiful boy always scored high grades and led a purposeful life that allowed small time for leisure. When not doing homework, he often practiced his violin, and for eight years he took lessons from Richard Arnold, first violinist of the Philharmonic Orchestra. Though never spanked or punished, Junior had to put up with unremitting religious indoctrination from Cettie.<sup>50</sup> By comparison, Father was almost playful. Eager to please his parents and other adult authority figures, Junior took things too seriously and was petrified of making a mistake.

It is a small miracle that, with so much duty so regularly dinned into their heads, the Rockefeller children didn't go batty. They did, however, erupt in a mass of psychosomatic symptoms. During his first year at Cutler, at age thirteen, Junior racked up a 98.1 grade average only to succumb to some sort of nervous collapse from overwork.<sup>51</sup> Too much expectation had been heaped on this frail vessel, and he buckled beneath the weight. His father ordered the staple Victorian cure of hard outdoors work. In late 1887, Junior and his mother wintered at Forest Hill, where he furiously chopped wood (fifteen cents a cord), broke stones, burned brush, and raked leaves, working the nervous tension from his system. Junior enjoyed this fleeting monopoly on his mother's affections and the respite from his regimented New York life. His letters to his father evoke the melancholy beauty of a snowbound winter, with moonlit sleigh rides and afternoons skating on the frozen lake as he pushed Cettie before him in a wooden chair.

Reinvigorated by his stay, Junior completed a second year at Cutler before being transferred to a school custom-made for him. John and William Rockefeller conferred with a talented instructor, John A. Browning, who created the tiny Browning School with just two classes: one built around Junior, the other around William's son Percy. A Rockefeller operation from the outset, it was set up in a family-owned brownstone on West Fifty-fifth Street, with John and William paying Browning's salary and reserving the right to screen applicants. From the beginning, the school emphasized manual crafts as well as classical studies and was animated by an egalitarian spirit. Nettie Fowler McCormick of the Chicago reaper clan sent her two sons, Harold and Stanley, and the student body of twenty-five also included two sons of William's estate superintendent in Greenwich, Connecticut. The Browning School was yet another attempt by John D. to prevent his children from putting on airs or slipping into idle dissipation.

The letters Junior sent his father from Forest Hill during the winter of 1887–1888 make clear that his mother was also recuperating from a bout of ill health. He told a friend, "Although it would be pleasant to be with the rest of the family, when we think how much good it is doing mother—and she really is getting much better, she sleeps so well and feels so much better—we are perfectly happy to be separated."<sup>52</sup> Always weak, Cettie was beginning to betray signs of the frailty that would convert her into an invalid. She enjoyed driving with her husband and shared his love of skating but took these activities only in small doses. "She was not strong . . . and could not endure much exercise," said her son.<sup>53</sup>

For the biographer of John D. Rockefeller, the most exasperating lacuna in his story is Cettie's transformation from a bright, witty girl into a rather humorless woman, prone to a nunlike religiosity. One wonders what happened to the high-spirited, vivacious young woman who was the high-school valedictorian and literary editor at Oread Collegiate Institute. By the 1880s, when she was in her forties, her letters were suffocated by a treacly piety and endless platitudes as she grew righteous and slightly unreal. As one magazine noted, "It would be hard to find anyone who has anything to say against Mrs. John D. Rockefeller, for the reason that Mrs. Rockefeller's life is almost wholly devoted to religious and benevolent work."<sup>54</sup> She uttered only noble and uplifting thoughts, constantly thanked the Lord, and never stooped to gossip or flip remarks.

Was this the case of another smart Victorian woman who felt trapped by the few options open to her and took to bed and religion from boredom or self-defense? The social conventions of her day clearly approved of her decision to confine herself to church and home. But one also wonders whether her cloistered religiosity wasn't a reaction to the mounting controversy surrounding Standard Oil. This gentle, brown-eyed woman adored her husband and believed implicitly in his goodness, but she was bothered by the charges hurled against him. We know from two of Rockefeller's colleagues that Cettie sometimes wanted him to respond to attacks that he preferred to slough off and ignore. In the 1860s and early 1870s, Rockefeller wrote her confidential, highly informative letters about his business dealings, including the SIC. Starting in the 1880s, however, his letters suddenly became bland and empty, full of banalities about the weather and barren of business news.

In general, Rockefeller kept his family apart from Standard Oil matters, with one curious exception. At the breakfast table, he sometimes read aloud samples from the reams of abusive crank mail that swamped his office. Perhaps he did this to make light of the threats or take the sting from controversy. Aside from this, he steered clear of anything even faintly controversial. Did Cettie's religion become her impenetrable shield against the venomous criticism of her husband? And did John become more self-righteous about temperance and other social issues to assert his own virtue and assuage his conscience? These are intriguing questions, but ones avoided so sedulously by Rockefeller and his family that they left no comments that might shed any light on them. Certain aspects of Rockefeller's married life—those critical things whispered about Standard Oil in the privacy of the bedroom at night—will likely remain a mystery forever.

Rockefeller always took umbrage at the accusation that he was a narrow workaholic, yet he didn't begin to travel abroad until after he had moved to New York and was well into his forties. A stubborn provincial, he didn't hanker after the exotic, and he shunned Asia, Africa, Latin America, and other distant outposts serviced by Standard Oil. For him, the aim of travel wasn't to submit to the charms of an alien place but to transport his culture there intact. He never traveled without a clergyman (typically Edward Judson or Augustus Strong) and a doctor (usually Hamilton Biggar) in tow to cater to his spiritual and physical needs. Although Rockefeller never owned a private railroad car, the railroads hooked one up for him, as needed, to a transcontinental train for domestic trips. These plush carriages were divided into six compartments, including a kitchen, pantry, observatory room, private room, and staterooms. Streaking across the Great Plains, the family exuberantly sang hymns, or the children practiced their musical instruments. For an hour each morning, the clergyman led a Bible session, expounding another beatitude. In mapping his itinerary, Rockefeller ensured access to a Baptist church each Sunday, and he especially liked to drop in on black churches, often leaving a substantial donation in his wake. Most of all, he rejoiced to find a good, rousing tent meeting on the road—that was a real vacation treat for a man who always found religion an uplifting experience.

In 1883, Rockefeller and Henry Flagler toured Jacksonville and Saint Augustine, Florida, and reviewed the state's economic prospects with Dr. Andrew Anderson and tobacco mogul George P. Lorillard. The next year, the Rockefellers headed down to Atlanta, swung west to New Orleans, and wound up in Los Angeles and San Francisco. Two years later, they made an extended trip to Yellowstone Park and returned by way of Chicago. By this point, even Rockefeller wondered whether he would ever escape the continental United States, telling Benjamin Brewster, "I may never get to Europe with my family although we have been expecting we might go in a year or two, but I am very desirous to know more of this dear land in which we

Deliverance came on June 1, 1887, when Rockefeller and his family set sail for a three-month European vacation, the Standard Oil executives trailing after them on a tugboat to wave good-bye. They must have been relieved because they feared that his indefatigable exertions at Standard Oil might injure his health. It took Rockefeller time to shed his obsessive concern for Standard Oil and allow himself to be lulled by the restful sea spirit. While still 460 miles from Southampton, unable to stop wondering about oil, he broke down and wired George Rogers, “I find I already thirst for knowledge about the business.”<sup>56</sup> A month later, he pleaded from Berlin, “Can’t you glean more of interest from Ex[ecutive] Com[mittee] for me about current business. Am anxious for every scrap of information.”<sup>57</sup>

After the Civil War, so many Americans flocked to Europe for vacations, presenting a cavalcade of innocents abroad, that their showy vulgarity and bumptious patriotism were frequently parodied by contemporary writers. The Rockefellers must have struck the Europeans as a dry, antiseptic family, somewhat awkward and ill at ease with foreign languages. Rockefeller made no concessions to the European milieu, which only accentuated his homespun style. In London, he booked a hotel room in Piccadilly that gave his family a front-row seat for Queen Victoria’s jubilee, and they stared agog as she whisked by in a magnificent golden carriage.

As the party crossed to France, John D. was alert for sharp characters out to swindle him and prey upon his American innocence. Because he didn’t speak French, he knew he looked like a vulnerable rube. At one point, he suspected, correctly, that their tour guide was fleecing them. Politely firing the man, he took charge of financial matters and pored over stacks of incomprehensible bills. Junior left a splendid vignette of his father trying to decipher a French check:

*I can see him now, going over the long French bills, studying each item, many of them being unintelligible to him. “Poulets!” he would exclaim. “What are poulets, John?” Or again, “Bougies, bougies—what in the world is a bougie?” And so on down the bill. Father was never willing to pay a bill which he did not know to be correct in all its items. Such care in small things might seem penurious to some people, yet to him it was the working out of a life principle.*<sup>58</sup>

Another traveling companion remembered the Rockefellers sitting at a private dining room in a Roman hotel as the paterfamilias dissected the weekly bill, trying to ascertain whether they had really consumed two whole chickens, as these slippery foreigners alleged:

*Mr. Rockefeller listened for a while to the discussion, and then said quietly: “I can settle that very easily. John, did you have a chicken leg?” “Yes.” “Alta, did you have a chicken leg?” “Yes.” “Well, Mother, I think I remember that you had one. Is that right?” “Yes,” said the mother. “I know that I had one, and no chicken has 3 legs. The bill is correct.” I can still see the faces of that family group and hear the tone of Mr. Rockefeller’s voice as he so quietly and so uniquely settled that dispute.*<sup>59</sup>

As he grew older, Junior was deputized to handle tips and bills, which he later cited as excellent business training.

Needless to say, Rockefeller spurned the European music halls and spent most of the trip making pilgrimages to churches or touring pretty scenery. At first, he declined an audience with the pope and yielded only when advised that it might please the Catholic workmen at Standard Oil. Still a man of exceptional fortitude, he and Junior went off for a vigorous mountain climb in Zermatt, Switzerland, and his stamina amazed his son. On this European trip, Rockefeller even found time to read and grew enraptured in Paris by Lew Wallace’s *Ben-Hur* and by Edward Bulwer-Lytton’s *Last Days of Pompeii* on a visit to Vesuvius. Yet he couldn’t disappear into a reverie for long. He was now so famous that as he went from city to city, his arrival was celebrated in the local papers and crank mail and begging letters began to follow him. So many letters piled up at hotels along the way that he finally had to purchase a big trunk just to carry them back. It was testimony to Rockefeller’s thoroughgoing sense of responsibility that he preserved each letter for review at home. For a man who had fled to Europe for a peaceful interlude, it must have been startling to realize that his fame and notoriety were now so widespread in a world dominated by Standard Oil that he could no longer find refuge anywhere from his own reputation.

Beleaguered by supplicants, Rockefeller tried to expand his disbursements to keep pace with his mounting income, and his donations nearly doubled from \$61,000 in 1881 to \$119,000 three years later. Notwithstanding his somewhat frigid image, he took a close interest in the recipients of his charity and directly monitored their progress. Even as he was being reviled as a corporate malefactor in the press, this contradictory man agonized over the judicious application of his money and found it harder to exercise scrutiny over charities than over business. In this seminal phase of Rockefeller philanthropy, the entire family judged the merits of applications, and the children sometimes audited important meetings. Once grace was said at breakfast, Rockefeller pulled out a folder stuffed with appeals from around the globe and assigned them to the children for further study. At this point, he drew no invidious distinctions among the children and involved all four equally in disposing of his fortune.

Rockefeller’s benevolent innovations have often been credited to his extraordinary philanthropic chief, Frederick T. Gates, who arrived on the scene in the 1890s. Yet by the 1880s, Rockefeller had already formulated certain core principles for his bequests, many of them stemming from beliefs he had long entertained as a businessman. For instance, like other industrialists, he worried that charity fostered dependence and pauperized recipients. After he had escorted his family to the notorious Five Points slum of lower Manhattan on their first Thanksgiving Day in New York, he lauded a shelter for homeless men but carped at the “policy of feeding all the tramps that came. My impression is they only do it once a year. I would give them work and make them earn their food.”<sup>60</sup>

Again, contrary to his stereotype, Rockefeller was acutely concerned about the poverty that accompanied industrialization, urbanization, and immigration in the late nineteenth century. Far from taking refuge in the world to come, he also stressed salvation in this world, prodding one clergyman to go into “the midst of the multitudes thronging up and down the Bowery or thereabouts, and settle and stay right there with them, establish a church.”<sup>61</sup> Starting in 1882, he underwrote the ministry of Edward Judson, who exemplified his belief that a shepherd should abide with his flock. He was the youngest son of Adoniram Judson, a saintly figure among nineteenth-century Baptists for converting the Burmese and translating the Bible into their tongue. Abandoning an affluent congregation in New Jersey, Edward Judson took over the Berea Baptist Church on Manhattan’s West Fifteenth Street to

evangelize among poor Italian immigrants. As an exponent of the social gospel, which blended social work with spiritual comfort, he convinced Rockefeller to contribute to a fresh-air and cool-water fund offering poor immigrants a refreshing two-week retreat in the country each summer.

As a regular dinner guest on Fifty-fourth Street, Judson won over Rockefeller to his vision of a comprehensive religious center that would unite elements of both an urban church and settlement house, ministering to both the worldly and spiritual needs of congregants, a vision spectacularly realized with construction of the Judson Memorial Church on Washington Square in 1892. For this imposing edifice, designed in Greco-Romanesque style by McKim, Mead and White with stained-glass windows by John La Farge, Rockefeller contributed \$40,000 of the original \$256,000. Both a community center and house of worship, it offered a broad spectrum of services from day nurseries to sewing classes for the poor. By this point, Rockefeller was indisputably the most powerful Baptist layman, and his largesse was already stirring fierce dissension in the ranks—not at all surprising in a denomination filled with working people. In the late 1880s, Judson told him about a convention of Baptist ministers in Philadelphia at which “some very shallow and ill-advised . . . vehement insinuations were made against the Standard Oil,” prompting another clergyman to deliver a “brave, ringing speech” in Rockefeller’s defense.<sup>62</sup> During the next two decades, this controversy grew more obstreperous as the Baptists tried to figure out whether the munificent oil mogul had been sent to them from heaven or hell.

The most important concept Rockefeller bequeathed to philanthropy was that of wholesale giving, as opposed to small, scattershot contributions. As Cleveland’s wealthiest philanthropist in the early 1880s, Rockefeller already felt oppressed by the appeals cascading in on him. In 1881, he apologized to Reverend George O. King of the Willson Avenue Baptist Church in Cleveland, saying, “I have been holding back [an] answer in part from the fact that I had so many obligations for benevolent objects that I was almost overwhelmed.”<sup>63</sup> Since for Rockefeller the imperative to make money and donate money emanated from a common religious impulse—“I am more and more satisfied no member of a church can afford not to contribute as the Lord prosper him,” he told a friend—he approached his donations with extreme gravity.<sup>64</sup>

In 1882, two of Rockefeller’s interests dovetailed memorably in a commitment to a black women’s school at a time when higher education for both blacks and women was held suspect. He had had a long-standing interest in education, having contributed for years to Denison University, a Baptist college in Ohio. In the 1880s and 1890s, he gave so openhandedly to A. C. Bacone’s Indian University (today Bacone College) in present-day Oklahoma that its first major building was named Rockefeller Hall. During the Civil War, Rockefeller gave to black ministers, churches, orphanages, and a deaf and mute society. He never relinquished a special solicitude for black welfare—quite atypical for a businessman at that time. Imbued with Baptist egalitarianism, he was ripe for conversion to a new cause when Sophia B. Packard and Harriet E. Giles reentered his life.

The Rockefellers had first met Packard and Giles on their honeymoon stopover at Oread Collegiate Institute, where the two women were newly recruited teachers. They were absorbed in the dismal plight of poor blacks, partly as an extension of their Baptist evangelism. After the Civil War, Baptists had been in the vanguard of forming churches for freed slaves and teaching them to read the Bible and had enjoyed the strongest growth in the black community of any denomination. So when Packard was named corresponding secretary of the new Woman’s American Baptist Home Mission Society in 1878, she had a serviceable vehicle for advancing black education. When she and Giles toured southern black schools two years later, they were appalled by the educational facilities for black women and found one especially glaring omission: Georgia, with the largest black population, lacked a single institution of higher learning for black women. To rectify this, in 1881 they opened a school for young black women—many of them born under slavery and still illiterate—in the dank, dilapidated basement of the Friendship Baptist Church in Atlanta, christening it the Atlanta Baptist Female Seminary. The first class had eleven students, mostly mothers. For two sedate, decorous New England ladies to venture into the troubled area of southern race relations represented a courageous act.

In June 1882, Packard and Giles visited Cleveland to make an appeal to potential donors at the Willson Avenue Baptist Church. For forty years, the Spelmans had passionately backed abolitionism and sundry black causes. The recently deceased Harvey B. Spelman had sat on the executive committee of the American Freedmen’s Union Commission. In consequence, Reverend King had a powerful hunch that the Rockefellers would respond enthusiastically to the pleas of Packard and Giles and promised the two women that if they came to his church, he would deliver John and Cettie Rockefeller in the audience.

Packard and Giles dressed with the same spinsterish simplicity, but the similarities ended there. Tall and blue-eyed, Packard was a brisk woman with a ready wit and great managerial gifts, while the younger Giles seemed timorous, gentle, and retiring in manner. That evening they made an affecting presentation, summoning up images of the 150 students, many unlettered but eager, who crowded the drab church basement to learn. As rain dripped down the walls and gathered in stagnant pools on the muddy floor, Packard and Giles sometimes stood in puddles as they taught eleven or twelve classes apiece each day; some classes were tightly wedged into a dusty area formerly used for coal storage. Breathing air thick with smoke and dust and ducking overhead heating pipes, the students had to kneel and write on wooden benches. To teach math, Packard and Giles laid sticks across the planks and had the students count them. At first, most of the women were provided with little more than a Bible, pad, and pencil, and the lighting was so poor that they couldn’t read on rainy days.

This poignant presentation would have wrung tears from a stone, and the Rockefellers were transfixed. As Harriet Giles recalled, “It was at that meeting that Mr. John D. Rockefeller first became interested in the school. After having emptied his pockets when the box was passed, he asked [us] the characteristic question, ‘Are you going to stick?’ and added, ‘If so, I will do more for you.’”<sup>65</sup> On the spot, he pledged \$250 more for their building fund. Much to the amazement of the teachers, he returned the next afternoon with three carriages and took them off to Forest Hill, where they drove about as honored guests.

Inspired by these women, Rockefeller, though socially conservative, became unalterably committed to black education. As one chronicler of Rockefeller philanthropy has noted, “The Rockefeller files are more extensive on this subject of the welfare of the Negro race than on almost any other.”<sup>66</sup> More than any benevolent project, the black women’s college in Atlanta became a Rockefeller family affair, as John was joined in his interest by his Spelman wife, sister-in-law, and mother-in-law. When it came to black education and welfare, Rockefeller displayed unwonted ardor. “Kindly assure the colored people of my sympathy for and interest in them and tell them, I hope they will in addition to securing knowledge from books, strive to learn to do all kinds of work, and better than any other class of men,” he wrote to one minister friend in the late 1880s.<sup>67</sup> Reciprocating the personal tone of his

correspondence, Sophia Packard always saluted him as “Dear Brother” or “Dear Friend.” Amid the hectic rounds of his life, Rockefeller always found time to send letters and small, thoughtful gifts to Packard and Giles to buck up their morale.

Rockefeller’s involvement in the Atlanta school was at first cautious but gradually acquired irresistible momentum. In late 1882, the Atlanta school bought nine acres and five buildings that had housed Union occupation troops. By late 1883, the fast-growing school had enrolled 450 students, the mortgage on the barracks property was coming due, and the school wavered on the edge of fiscal crisis. At this point, Packard and Giles entreated Rockefeller for a donation to secure the school on a permanent footing: “Give it a name; let it if you please be called Rockefeller College, or if you prefer let it take your good wife’s Maiden name or any other which suits you.”<sup>68</sup> Although Rockefeller retired the \$5,000 debt, he humbly declined to use his own name. Instead, in a fitting tribute to his in-laws, he opted for the Spelman name, thus giving birth to Spelman Seminary, renamed Spelman College in 1924. It developed into one of America’s most respected schools for black women, counting Martin Luther King, Jr.’s mother and grandmother among its many prominent alumnae.

On April 11, 1884, Rockefeller and his family went by train to Atlanta to celebrate the school’s third anniversary, and 450 students packed the chapel to glimpse their patrons. Rockefeller adored Negro hymns and spirituals and now heard them in abundance. After the opening hymn, Sophia Packard exclaimed, “I bless the Lord that I have lived to see this day.”<sup>69</sup> In a string of brief speeches, Cettie Rockefeller paid tribute to the liberating power of song, sister Lute memorialized their father’s abolitionist work, and their mother told how the Spelman home had been a stop on the Underground Railroad. Though Rockefeller virtually never spoke in public, he delivered a talk of unaffected eloquence: “It is in your hearts to make the school one that people will believe in. God will take these small beginnings to do a great work. I am thankful to be here.”<sup>70</sup> When Rockefeller sat down, it was announced, amid sustained cheers and hosannas, that the school had been renamed Spelman Seminary.

As a paradigm of future Rockefeller philanthropy, several things about Spelman should be flagged for attention. In a delicate balancing act, Rockefeller gave enough to get projects under way, yet not so much as to obviate future fund-raising. In 1886, Rockefeller Hall was dedicated, which included dormitory rooms and a beautiful chapel. During the coming years, he gave another eleven acres plus the money for additional dormitories, a laundry, a dining hall, and numerous other buildings, creating a lovely, elegant campus. Presented with architectural plans for one new building, he commented, “My suggestion is to err in getting what seems at present too much room rather than not enough. I judge the crop of colored folks will be large.”<sup>71</sup> In the 1890s, Rockefeller sent his own landscape architects to redesign the campus, and he himself selected the trees and shrubbery.

Yet for all this fervent support, Packard and Giles had to struggle for years to keep the school afloat. With one check, Rockefeller might have relieved their anxiety forever, but he wanted to avert excessive dependence and keep alive a creative ambiguity about his intentions. While briefly serving on the Spelman board of trustees, he preferred to remain slightly detached and subtly enigmatic, never telegraphing his plans too far in advance.

Another cardinal principle of Rockefeller philanthropy was to rely upon expert opinion. Many of his gifts to Spelman Seminary were channeled through Dr. Henry L. Morehouse, the field secretary of the American Baptist Home Mission Society, which increasingly functioned as a conduit for Rockefeller’s wholesale philanthropy in education. Taxed by too many pleas for money, Rockefeller wrote to Morehouse on December 24, 1883, and inquired whether “to avoid having all these people from every part of the country calling” on him it might not be “much better for the cause” for him “to give all through the Home Mission Society.”<sup>72</sup> Frederick T. Gates later took credit for this sane, efficient method of giving through umbrella groups that would then allocate money locally, but the idea had already taken root in Rockefeller’s mind. In these early years, one also sees Rockefeller using contributions to stimulate collaboration from others as he inched toward the concept of matching grants. For instance, in 1886, he pledged \$30,000 to Morehouse, hoping that it would prove the catalyst for a \$150,000 fund drive.

Since Rockefeller believed in meritocracy, not aristocracy, he favored educational opportunities for minorities. Spelman Seminary taught nursing, teaching, printing, and other useful trades, but the focal point was training young black women for a good Christian life. Some of the first graduates went to the Congo as missionaries. As Packard and Giles told Rockefeller several years later, “God is blessing the school spiritually as well as temporally; a number [of students] have entered upon the Christian life since the term commenced. We believe the salvation of the race and our country depends upon the Christian training of these girls who are to be future mothers and educators.”<sup>73</sup> In the early years, Spelman Seminary encouraged a Victorian gentility among the students, turning out well-bred young ladies in hats and gloves. At the same time, it evinced much of the practical, enterprising spirit espoused by Booker T. Washington, the principal of Tuskegee Institute in Alabama, who stressed vocational training for blacks. Before long, this approach to black education would be anathematized as futile and condescending by W.E.B. Du Bois and other critics who thought blacks capable of the same higher education as whites and felt they were doomed to mediocrity by vocational training. But whatever its early imperfections, Spelman College ultimately evolved into one of the most highly regarded institutions for black women in America.

*The Puppeteer*

Because Standard Oil had long exercised a global monopoly, Rockefeller's name was already known abroad. Foreign markets were larger and more lucrative than domestic markets—some 70 percent of American oil went abroad in the mid-1880s—while some feeble competition managed to sputter on at home in the face of daunting odds. In the early 1870s, kerosene penetrated China, Japan, and other far-off spots, and one American traveler in 1874 saw Standard kerosene flickering in the ancient quarters of Babylon and Nineveh. In the early 1880s, 85 percent of world crude-oil production was still extracted from Pennsylvania soil, making it America's fourth-largest export, and only Russian oil constituted a serious competitive threat. Since it made no sense to clamp down excess capacity at home only to see it expand abroad, Rockefeller could never tolerate foreign rivals, telling one colleague, "We have the capacity to do all the home trade as well as the export, and I hope we can devise ways and means to accomplish it later on; at all events we must continue to strive for it."<sup>1</sup>

Standard Oil studied foreign markets and posted a cultivated oil merchant, William Herbert Libby, to the Far East in 1882 to make a two-year survey. Observing that oil had "found its way into more nooks and corners of the civilized and uncivilized countries than any other product in business history emanating from a single source," Libby proselytized for kerosene in Japan, China, and India.<sup>2</sup> After translating into Chinese a pamphlet touting the safety of kerosene lamps, Libby had the satisfaction of seeing sampans laden with Standard Oil products floating up rivers deep in China's interior. To inflate demand, the combine sold hundreds of thousands of cheap lamps and wicks and sometimes distributed them gratis along with the first kerosene purchase. "In many countries," said Rockefeller, "we had to teach the people . . . to burn oil by making lamps for them; we packed the oil to be carried by camels or on the backs of runners in the most remote portions of the world; we adapted the trade to the needs of strange folk."<sup>3</sup>

For a time, Standard ruled foreign markets no less dictatorially than domestic ones, and with crude oil found in large quantities only in western Pennsylvania, it seemed this idyll might last forever. Then this fool's paradise was roughly shattered in the early 1870s by a giant scramble for oil at the Russian port of Baku on the Caspian Sea. For more than a century, the natives had scooped up crude oil from huge pits, selling it mostly to Persians to lubricate their cart wheels, grease leather harnesses, and alleviate rheumatic pains. In the early 1870s, this primitive industry was suddenly thrust into the modern world when drillers struck wells of unprecedented force. Amid deafening roars, black geysers shot into the air with such staggering power that some of them couldn't be capped for months; one raging gusher spouted 2,400 tons of oil within its first twenty-four hours.

In 1873, Robert Nobel, a member of the illustrious Swedish family, arrived in the Caucasus on a mission unrelated to oil. His brother had a contract to produce rifles for the Russian government, and Robert was scouting walnut trees for use as rifle stocks. Instead, he stumbled upon the bedlam of Baku, a frantic scene of such ghastly beauty that Maxim Gorky later limned it as "a dark hell painted by an artist of genius."<sup>4</sup> A crossroads as exotic as it was hellish, a Moslem enclave bristling with minarets, mosques, and palaces, Baku presented two faces to the traveler. In the bazaars, vendors hawked everything from Russian sugar to Persian silks, while outside of town a thick canopy of black smoke enveloped the refineries.

Robert Nobel took his 25,000 rubles of walnut money and plumped it down to buy a refinery. Where local kerosene had hitherto been mocked as Baku sludge, the Nobel refineries produced kerosene equal to that of Standard Oil, which monopolized the Russian marketplace in the early 1870s. Bringing sophisticated management and ample funds to the industry, Nobel and his brothers had created by decade's end an eight-mile pipeline to the Caspian Sea, where they floated the world's first oil tanker, the *Zoroaster*. They pioneered a continuous refining method that was superior to Standard's batch system for sorting out distillates. In 1879, the Nobels organized the Nobel Brothers Petroleum Producing Company and soon cobbled together an impressive distribution system, complete with flatcars, tank cars, and storage depots, ejecting Standard Oil from Russia. That year, a roving Standard operative, William Brough, sent Rockefeller samples of Russian crude and refined oil along with prophecies that in a few years the Nobels would build a pipeline or railroad from the Caspian to the Black Sea, setting the stage for Russian oil to challenge Standard Oil in European markets.

***Rockefeller's first influential critic, Henry Demarest Lloyd, in Boston in 1903. (Courtesy of the State Historical Society of Wisconsin)***

By the early 1880s, two hundred refineries cluttered Baku's oil-stained slopes, and in 1883—true to Brough's forecast—a railroad connected Baku

on the Caspian Sea to Batumi on the Black Sea. The potent Russian wells flowed with such fierce abundance that it was cheaper to produce oil in Russia than at Titusville, and cut-rate kerosene soon flooded European markets, undercutting Standard's prices. The American consul in Batumi, J. C. Chambers, who had been dispatched by Standard Oil to harvest intelligence, kept Rockefeller apprised of these developments and sounded an alarm about the Russians' "quixotic ambition to drive the American oil from the markets of the world."<sup>5</sup> Whatever the coolness between Rockefeller and American officialdom at home, they cooperated overseas to stop tariffs against American oil. Paying tribute to the State Department, Rockefeller later said, "Our ambassadors and ministers and consuls have aided to push our way into new markets to the utmost corners of the world."<sup>6</sup>

Rockefeller seems to have been caught napping by the Russian incursion just as he had snuffed out all his major domestic rivals. When his Hamburg agent, Charles F. L. Meissner, reported in 1885 on extensive Russian penetration of European markets, Rockefeller, taken aback, fired off an indignant blast at his executive committee: "I am at a loss to understand how the bulk transportation could have been carried on to the extent referred to in Switzerland and elsewhere, without our having received more information about it."<sup>7</sup> To retaliate, Rockefeller resorted to the usual high-powered weaponry, cutting prices across Europe and starting an insidious whispering campaign to question the safety of Russian kerosene. His files also reveal numberless secret contacts in Paris and London hotels with shadowy, self-appointed intermediaries inquiring whether Standard wished to buy a stake in Nobel Brothers or join with them in slicing up European markets. In 1885, Standard's peripatetic emissary, W. H. Libby, held talks with the Nobels in Saint Petersburg, but these overtures faltered. The Nobels' power in Russia hinged on their relationship with the despotic czarist government, and they didn't intend to admit Standard Oil into their preserve.

By the mid-1880s, another powerful force appeared on the world oil scene. The Paris Rothschilds, led by Baron Alphonse de Rothschild, had built refineries at Rijeka and Trieste on the Adriatic Sea. In organizing the Caspian and Black Sea Petroleum Company—better known by its Russian initials, Bnito—they stood to reap a fortune from inexpensive Russian oil. No sooner had the Rothschilds entered the business than reports filtered back to Rockefeller that the Nobels, who were heavily in debt to the Rothschilds, could not meet their payments and might be forced to make common cause with the French bankers. For many years, the Rothschilds, the Nobels, and Standard Oil circled around each other, each trying to forge links with a second party to isolate the third.

This vigorous competition abroad aroused Rockefeller's fighting spirit, and he even took to lecturing his colleagues in verse: "We are neither old nor sleepy and must 'Be up and doing, with a heart for any fate; Still achieving, still pursuing, learn to labor and to wait.'"<sup>8</sup> Both Rockefeller and Archbold favored scrapping their former system of operating through European brokers and instead launching their own marketing subsidiaries. For a time, they were held back by Benjamin Brewster, and Rockefeller, unwilling to move without a consensus, yielded against his better judgment. When the Rothschilds set up a British oil-marketing firm in 1888, Brewster's logic suddenly crumbled, and twenty-four days later Standard Oil set up its first overseas affiliate, the Anglo-American Oil Company, which soon monopolized the British oil trade. Two years later, Standard started the Deutsche-Amerikanische Petroleum Gesellschaft in Bremen to handle the north German market. Neither old nor sleepy, Rockefeller set up an oil terminal at Rotterdam, struck a deal to supply all of France's crude oil, took stakes in oil firms in Holland, Italy, and Scandinavia, and orchestrated heated price wars in India. Taking a cue from the Nobels, Standard launched its first oil-tank steamer to Europe, a mammoth vessel that transported a million gallons of oil, the first of what would shortly be an entire ocean fleet piloted from 26 Broadway.

Despite the low price of Russian oil, Standard barred it from America and retained nearly 80 percent of world markets in the late 1880s. For all the complaints about adulterated kerosene that Rockefeller heard on his European travels, the Nobels and Rothschilds never matched the quality of Standard's products or surpassed its integrated operation. For Archbold, it was the Russians' failure to consolidate their domestic industry—that is, to suppress competition and establish a trust—that consigned them to secondary status. "If there had been as prompt and energetic action on the part of the Russian oil industry as was taken by the Standard Oil Company, the Russians would have dominated many of the world's markets which have been made to inure so largely to the benefit of the American oil industry."<sup>9</sup>

If the Nobels and the Rothschilds weren't mortal threats, neither did they capitulate tamely to Standard Oil, as so many American rivals had. These contending forces clashed repeatedly in the oil wars of the 1890s, a protracted battle that saw periods of blistering competition followed by cozy deals to divvy up markets. When competition forced price-cutting in the early 1890s, Rockefeller advocated a tactical rapprochement with his erstwhile foes and induced Baron Alphonse de Rothschild to visit 26 Broadway in secret. Archbold's report to Rockefeller about the July 1892 meeting revealed that, beneath the competitive veneer, the Rothschilds were eager to come to terms with Standard Oil:

*We reached a tentative agreement with them. . . . I need hardly report again that it seems desirable on all sides that this matter be kept exceedingly confidential. It was thought best that we should not see the Nobel people, but that the approach be made to them on the subject by the Rothschilds. We were treated with great courtesy by Baron Rothschild, and we [were] much delighted that he spoke English fluently, which greatly facilitated our intercourse.*<sup>10</sup>

In the end, Count Sergei Witte, the Russian finance minister, spiked the scheme for a grand alliance of Standard Oil with the Nobels and Rothschilds—to the dismay of countless European newspaper cartoonists who had made sport evoking the clumsy embrace of the octopus and the bear. All the while, Russia kept pumping crude oil and by the late 1890s briefly overtook the United States in oil production, even though Standard Oil handily eclipsed it in refining.

By 1890, it was self-evident that oil existed throughout the earth's crust and that only a freak accident (plus some timely Yankee ingenuity) had led to the business being founded in Titusville. In 1884, Dutch drillers began prospecting for oil in Sumatra and six years later received a royal charter to exploit Dutch East Indian reserves, christening their company Royal Dutch. Meanwhile, another aggressive contender waited in the wings. In 1891, the enterprising London merchant Marcus Samuel signed a contract with the Rothschilds to market their kerosene in the Far East. Samuel used the Suez Canal to speed the export of Russian kerosene to Asian markets. Oil had taken four months to travel from New York to the Far East but now reached it from Batumi in a month. Even though Samuel designed a custom-made bulk tanker, the *Murex*, to conform to the canal's strict requirements, Standard Oil hired London solicitors to sow doubts about the project, spreading nasty rumors about a "powerful group of financiers and merchants" under "Hebrew influence" who planned to take tankers through the canal.<sup>11</sup> Rockefeller later ranted against "our Asiatic competitors controlled by Jewish men who cry

‘Wolf ! Wolf! Standard Oil Company!’ and keep moving in and getting control of markets.”<sup>12</sup> (He once compared Standard Oil’s supposedly “fair-minded” methods with “the old, old Jew method of treating one customer one way and another in another [way].”) <sup>13</sup> Warding off this verbal sabotage, Samuel managed to defeat Standard Oil decisively, and his trademark red oilcans—in contrast to Standard’s blue cans—soon became known throughout Asia.

By 1892, with oil production booming in Burma and Java, Standard Oil belatedly recognized the need for concerted action in Asian markets. It tried in vain to buy the business of both Royal Dutch and Marcus Samuel, who renamed his company Shell Transport and Trading Company in 1897 to honor his family’s old seashell-box business. Standard even stooped to trading for Russian kerosene in order to serve better its Asian customers. It finally set up a series of Asian stations and assigned a small army of agents to Shanghai, Calcutta, Bombay, Yokohama, Kobe, Nagasaki, and Singapore. These operatives sold Standard kerosene in tin cans with wooden frames because Asian customers recycled the tin as roofing and turned the wooden cases into household objects. For all these smart marketing ploys, Standard Oil was forced to coexist with Royal Dutch and Shell, which merged to create a rival empire in the early 1900s. Henceforth, competition was enshrined as a permanent fact of the international oil business—despite a multitude of secret, market-sharing deals—and it was only a matter of time before the deadly contagion of competition infected North America.

Even as it was menaced by new competitors abroad, Standard Oil seemed omnipotent in American oil. Everything about its operation was colossal: Twenty thousand wells poured their output into 4,000 miles of Standard Oil pipelines, carrying the crude to seaboard or to 5,000 Standard Oil tank cars. The combine now employed 100,000 people and superintended the export of 50,000 barrels of oil to Europe daily. Rockefeller’s creation could be discussed only in superlatives: It was the biggest and richest, the most feared and admired business organization in the world. Earning steady, reliable profits, year in and year out, Rockefeller could be forgiven for believing he had outwitted the business cycle. For a man who craved order, he had reached his apogee. No longer at the mercy of unpredictable economic forces, he thrived even in recessions.

Rockefeller was exceedingly pleased by the harmonious workings of his fantastic machinery and the neat, orderly unfolding of his days. When he arrived at work each morning, he sat at his rolltop desk and examined two stacks of paper, one representing decisions made, the other matters to be thought over, and he slowly burrowed his way through both piles. Starting in the 1880s, he adopted a policy of never doing business with strangers or even meeting them, avoiding unwanted solicitations and controversy. If this simplified his life, it also strengthened the unsettling image of an untouchable tycoon, hidden behind the scenes.

Many of Rockefeller’s critics alleged that he divided his life into compartments and kept two separate sets of moral ledger books: one governing his exemplary private life, another sanctioning his reprehensible business behavior. But he saw his entire life guided by the same lofty ideals. In retirement, he wrote to Harvard president Charles Eliot, apropos of Standard Oil, “I can say without hesitation that no business organization with which I have ever been connected has been controlled by higher ideals.” <sup>14</sup> One way that he upheld this belief was to become self-righteous about his opponents, whom he reviled as undisguised rascals. “The other people were up to all sorts of tricks, mixing benzine with the oil, and so forth,” he said of rival refiners. <sup>15</sup> Nobody was more vigilant about being cheated than Rockefeller nor quicker to seize the moral high ground. To convince himself that he was a highly ethical businessman, he redefined exactly what that meant. For instance, he always made much of the fact that he honored contracts, paid bills and debt promptly, treated small shareholders fairly, and never watered stock. To confirm his clean, sanctimonious image of himself, he reiterated these ideals with a kind of incantatory relish, and the more naysayers dwelled on his railroad dealings or secret subsidiaries, the more he affirmed his own compensating code of business honor. This was as much to preserve his own self-image as to persuade a skeptical public that he was honorable, for Rockefeller desperately needed to have a good opinion of himself.

What further blinded Rockefeller to his misdeeds was that by the 1880s he always stood at several removes from any mayhem. He was now a master puppeteer, adroitly manipulating his marionettes, with the strings artfully concealed. As Standard Oil’s leading figure, he was the only person who didn’t have any direct operational responsibility. Instead, statesmanlike, he applied himself to general policy and monitored the performance of lieutenants, who sent him copious reports about their activities and often boasted shamelessly of their unsavory deeds. In contrast, Rockefeller replied in brief, opaque letters. He never assumed total confidentiality, even in internal memorandums, and cultivated a spare, elliptical style, devoid of names or specifics, that would have baffled any prosecuting attorney. In creating this self-protective structure, Rockefeller could run Standard Oil while simultaneously sidestepping responsibility, erasing incriminating evidence, and avoiding contact with his victims. It enabled him to distance himself from the dirty work down below and feign ignorance of what was happening. When confronted with well-documented cases of terror tactics used by subordinates, he blandly conceded some few indiscretions by overly zealous employees and cast himself as a helpless spectator. But if one examines the reams of letters sent to him by his associates, his pose of innocence crumbles. He knew everything that was going on and now, for the first time, we can document it. For that reason, we will digress occasionally in this chapter from the linear narrative of Rockefeller’s life to examine reports he received from the field. They leave no doubt that he was the brains of the operation, directing activities he professed to deplore and setting the tone for his subordinates. This, of course, only complicates the mystery of how he integrated the various facets of his life—of how the enlightened patron of Spelman Seminary could also be the brutal overlord of Standard Oil. In the end, we can only explain how he rationalized his behavior to himself and others; given the absence of revelatory letters or diaries, we can say little about the unconscious drives that led him to do this or the mental strains it might have caused.

In his memoirs, Rockefeller implied that Standard took no rebates after 1880, whereas his files disclose that collusion with the railroads became even more brazen after that date. By the early 1880s, the railroads had ceded supremacy in oil transport to the Standard-dominated pipelines, which now carried more than three-fourths of the crude oil from the Pennsylvania wells to coastal cities, charging Standard Oil’s own refineries half the posted price. Not surprisingly, as the railroads weakened, Standard Oil only browbeat them more. The combine owned a subsidiary, the Galena-Signal Oil Company, which monopolized the manufacture of high-grade railroad lubricants. Simply by stalling on shipments of this indispensable grease, it could bring any railroad to a halt. If Standard wished to extract a railroad rebate, it merely tacked on a surcharge to the price of Galena cylinder or engine oils. And Rockefeller continued to play his favorite trump card: the tank-car fleet. By the late 1880s, Standard Oil was leasing its tank cars to 196 railroads, forcing most of them to pay a double-mileage tribute to 26 Broadway—that is, a mileage royalty on outward-bound trips, when the cars were topful of oil, and also on inward-bound trips, when they returned empty.

One reason for Rockefeller's continuing solicitude toward the roads after the pipeline revolution was that he himself had a significant investment in them. He conceded as much when he stated that Standard Oil stockholders "as the years had gone by were becoming more and more a factor in railway problems and other enterprises."<sup>16</sup> At the time, railroad shares were among the few blue-chip securities available to rich investors, which meant that Rockefeller invested heavily in the Erie, the New York Central, and other oil-carrying roads. In March 1881, Rockefeller wrote A. J. Cassatt of the Pennsylvania Railroad about rumors that his railroad would soon issue \$400,000 worth of stock. He suggested they set up a joint private account of Pennsylvania stock—with Rockefeller making the payment.<sup>17</sup> Whether this deal was executed is unclear, but it was a blatant bid to connive with a major railroad executive.

In later years, when Ida Tarbell made railroad manipulation the focal point of her Standard Oil indictment, Rockefeller pleaded ignorance of such dealings, claiming they were handled by his colleagues while he magisterially confined himself to broader matters. In fact, his papers document that he either met directly with railroad presidents or else was given graphic, blow-by-blow accounts of negotiations by Flagler, Archbold, O'Day, Payne, Warden, and a formerly little-noticed figure, Colonel W. P. Thompson, who had headed a Virginia cavalry unit for the Confederacy. The secretary of Standard Oil of Ohio and a brother-in-law of Standard power broker Johnson N. Camden, Colonel Thompson shared a Cleveland office with Rockefeller and Payne, and his letters furnish explosive proof of extensive railroad collusion in the 1880s. While Rockefeller made it seem as if such shenanigans occurred far from his sphere, he was fully briefed by Thompson, who liked to boast of his maneuvers.

Rockefeller's files are chock-full of examples of rebates well into the 1880s. In March 1886, William G. Warden reported from Philadelphia that the Pennsylvania Railroad had agreed to the following discounts: Fifty-two cents per barrel to ship oil from Oil Creek to New York (versus a listed rate of 78 cents) and 39 cents to Philadelphia (versus 65 cents for other refiners). Rockefeller was always insistent that Standard's competitive advantage had nothing to do with preferential transport rates, but his correspondence reveals that rebates could single-handedly transform an unprofitable plant into a profitable one. In 1886, Colonel Thompson told him that it made sense to proceed with a new naphtha plant at Oil City (naphtha was a crude-oil fraction used to make gas or solvents) only if the Lake Shore hauled the finished product to Cleveland for ten cents instead of seventeen.<sup>18</sup> During these negotiations, Colonel Thompson also reported that low freight rates would enable them to rehabilitate an otherwise insolvent Oil City refinery. Wherever possible, Thompson preferred oral agreements, once telling Rockefeller of his talks with two railroads, "I think they will concede the undesirability of a regular written contract."<sup>19</sup>

The backdoor deals with the railroads necessarily generated more speculation than proof at the time. But it was the trust's marketing operation that ultimately proved its undoing, for it directly touched consumers and tens of thousands of small businessmen located in every congressional district. In the 1870s, Rockefeller began to assemble a marketing organization to eliminate the middlemen, independent agents who had earned three to five cents per gallon of kerosene. Since they handled Standard kerosene *and* competing products—an intolerable situation for Rockefeller—and often cared more about gouging consumers than expanding markets, he decided to get rid of them.

Furthermore, Standard's refinery flow was now too huge to depend upon this fragmented, obsolete distribution system. Kerosene demand was booming as it illuminated mills, factories, hotels, and office buildings in the growing cities. To exploit economies of scale, Rockefeller noted, "we had to create selling methods far in advance of what then existed; we had to dispose of two, or three, or four gallons of oil where one had been sold before, and we could not rely upon the usual trade channels then existing to accomplish this."<sup>20</sup> To have high-volume, low-cost production, the Standard needed huge guaranteed sales. This forced Rockefeller to integrate vertically the entire industry, controlling everything from the wellhead to the consumer.

Around 1882, in a revolutionary development, the trust began to sweep away the old distribution system, with its horse-drawn carts full of swaying barrels, and disburse millions of dollars to build thousands of tank wagons to service every American town. Rockefeller hailed the efficient new system: "I believe it one of our best means for getting and holding the trade."<sup>21</sup> It worked thus: Standard's tank cars or pipelines delivered refined oil to storage tanks, where the tank wagons were filled up. From here, the wagons set out for local groceries and hardware stores—the principal retail outlets—where they replenished special canisters that the trust provided. Sometimes, over the furious opposition of storekeepers, tank wagons even went door-to-door, selling directly to households and putting Standard smack in the retail trade. (In some places, the trust manipulated local retailers by saying that they would refrain from this practice *if* storekeepers dealt exclusively in Standard kerosene.) The combine also sold, almost at cost, heaters, stoves, lamps, and lanterns to widen the market; in the manner of a modern corporation, Standard Oil created demand as well as satisfied it, and its obliging agents helped consumers clean lamps and burners to enhance their use.

Grocers and hardware merchants resented the demand to stock only Standard Oil kerosene or be starved out of the business. Along with wholesalers rendered obsolete by the Standard marketing effort, they emerged as Rockefeller's most potent enemies. Conveniently, Rockefeller never set eyes on these men, had no sympathy for them, and chided them for standing in the way of progress. "Of course it is natural that the man who drove the stage coach should be antagonistic to the railroad and that the man who used to keep the small inn should look with disfavor upon the big, magnificent hotels."<sup>22</sup>

Since jobbers often adulterated Standard Oil kerosene with poor-quality product from independent refiners, Rockefeller hoped that his marketing operation would ensure a uniform quality of Standard Oil products. The 1870s witnessed five thousand to six thousand deaths annually from accidents caused by faulty kerosene.<sup>23</sup> Far from being immune to complaints, however, Standard Oil was bedeviled by reports that its kerosene emitted an offensive odor, crusted wicks, and smoked lamps. One day in Cleveland, an angry woman pushed her way into Rockefeller's office and demanded to know what he planned to do about his poor kerosene. Indignantly, he marched off to the lab and had the woman's sample analyzed, the results unknown. At 26 Broadway, he tracked the activities of the manufacturing committee, which burned kerosene lamps for six hours at a time to test oil quality. Always touchy about complaints, Rockefeller often blamed poor wicks and developed the Acme wick to eliminate those complaints. To his consternation, customers still grumbled even after they switched to this allegedly foolproof article.

Standard's marketing subsidiaries were conducted with such controlled ferocity that they became the most hated part of the entire organization. One must recall that Standard Oil was a federation of companies, not a single firm, and held only a partial interest in many affiliated companies. This invited trouble, for Standard often retained the original managers and allowed them a fair degree of autonomy. When the combine absorbed established

marketing concerns, it brought into the organization several rogue proprietors who tarnished the Standard Oil name. Later on, Rockefeller feigned ignorance of their actions and disclaimed responsibility when, as we shall see, he received elaborate warnings about their methods.

In 1873, Standard secretly bought half of Chess, Carley and Company, which had a Louisville refinery and a lucrative marketing operation in the Southeast. The owner, F. D. Carley, was a lapsed Methodist minister who set a new standard for pitiless methods in oil marketing. Confidential reports informed Rockefeller that Carley was a charming scoundrel, an inveterate gambler who went straight from board meetings to his bookie's office; even the circumspect Rockefeller referred euphemistically to Carley's "want of balance."<sup>24</sup> Although Rockefeller planned to pack Chess, Carley's board with a majority of Standard directors, Carley blocked outright control from 26 Broadway until 1881, and another five years elapsed before Standard swallowed the firm whole and renamed it Standard Oil of Kentucky.

By then, Chess, Carley had become a byword for vicious tactics. When F. D. Carley learned that Standard Oil's nemesis George Rice had shipped a scant seventy barrels of kerosene to a Louisville merchant, he reacted furiously. As a director of the Louisville, Nashville and Great Southern Railroad, which had granted Rice low freight rates, Carley had an underling dash off a peremptory letter to the railroad's freight agent, telling him exactly how to treat Rice: "Please turn the screw."<sup>25</sup> When this quotation was revealed by investigators years later, it was emblazoned in newspaper headlines across America.

Carley went to extravagant lengths to stop competitors. When he learned that Rice planned to sell kerosene in Columbus, Mississippi, he sent local grocers an unambiguous letter: "If you do not buy our oil we will start a grocery store and sell goods at cost and put you all out of business. " <sup>26</sup> No bluffer, Carley set up a store that sold Standard Oil kerosene at cut-rate prices, as well as oats, meat, sugar, coffee, and other household items at or below cost. In many localities, grocers gladly took a 5 percent discount offered on foodstuffs by Carley in exchange for an agreement to carry only Standard kerosene, one of many anticompetitive practices perfected by Standard Oil that shaped future antitrust legislation. Notwithstanding the public uproar, Rockefeller claimed to be unaware of Carley's practices. Yet at one point, Colonel Thompson confidentially told Rockefeller that Carley was a "secret, surreptitious" man with "mysterious, dishonest secrets" who even cheated on his agreements with Standard Oil.<sup>27</sup>

In 1878, Standard Oil boldly expanded its marketing territory by acquiring a 40 percent stake in the Waters-Pierce Company, which was based in Saint Louis and dominated a wide swatch of territory from Arkansas to Texas. It was decided that Chess, Carley would monopolize the oil trade east of the Mississippi, while Waters-Pierce would control the area southwest of the river. The Waters-Pierce deal brought another patent scoundrel into the trust, Henry Clay Pierce, who made F. D. Carley look like a cherub in comparison. By age nineteen, this country doctor's son monopolized the kerosene trade in Saint Louis, and then he mounted a pony and branched out into Arkansas and Texas. Even Standard Oil people never defended Henry Clay Pierce. One executive recalled him as a gifted businessman but added, "He couldn't do a thing straight if it could be done crooked. He was cordial and polite enough, and it was only when he got into a jam with people that he became nasty. Then they knew they were fighting someone. He was the greatest fighter you ever saw."<sup>28</sup>

Once again, Rockefeller self-servingly disclaimed knowledge of the rough-house tactics used by the Waters-Pierce salesmen and portrayed Pierce as a loose cannon who operated on his own initiative. He said that he never gave "a minute in a month to this local trade" and that any marketing excesses, when exposed, were condemned by the executive committee, but his files show that he received a full accounting of Pierce's high crimes and misdemeanors.<sup>29</sup> When Pierce made a highly profitable foray into the Mexican market in 1880, Colonel Thompson reported to Rockefeller that this had been accomplished "largely by evasion of the enormous duty placed upon Refined oil by Mexico."<sup>30</sup> Enriched by this operation, Pierce declared a 100 percent dividend on capital the next year. Thompson repeatedly warned Rockefeller about Pierce, branding him "a man not without designs" and relaying a letter "showing great duplicity on the part of Mr. Pierce."<sup>31</sup> Far from rebuking Pierce, in 1892 Rockefeller extended him a personal loan for \$200,000—a king's ransom—and patiently carried him for eight years. Clearly, he had no qualms about the buccaneering spirit of the Waters-Pierce business.

The Standard Oil marketing subsidiaries fanned out across the remaining sections of the continent. In 1878, the Consolidated Tank Line Company took over the territory north of the Missouri River, spread across Michigan and Minnesota, then expanded westward into the Dakotas. Formed in 1884, the Continental Oil Company covered the Rocky Mountain states. In the mid-1870s, the trust sent a young executive to California, Wesley H. Tilford, who foresaw the state's potential as both an oil producer and consumer; a decade later, Standard Oil of Iowa developed this West Coast trade. Many frustrated customers of Waters-Pierce turned, in revenge, to Republic Oil, a New York-based company that specialized in cultivating retailers who loathed the trust. Of course, Republic was secretly owned by Standard Oil.

Around 1886, 26 Broadway divided the continent into eleven marketing districts, with boundary disputes to be resolved by a domestic-trade committee. As subsidiaries raided each other's territories, their clashes were arbitrated by headquarters. Nothing so clearly reveals the trust's imperial character than its deliberations about marketing territories, where exclusive rights to entire states and countries were dispensed like so many royal charters. At one point, when Chess, Carley; Waters-Pierce; and Consolidated Tank Line tangled over the virgin southwestern territory, Colonel Thompson explained to Rockefeller, "I have, for a long time, waited for the opportunity of defining the western limits of all these connections and take the liberty of saying on behalf of Standard Oil Co. that we had never conceded to any one the right to go and occupy Colorado, New Mexico, Arizona or Mexico."<sup>32</sup> In the end, Standard Oil ceded Mexico to Henry Pierce in a swap for the state of New Mexico.

Once Rockefeller controlled a marketing territory, he protected it fiercely and quickly dispatched troops to fend off the smallest incursion. If Standard Oil spotted even one carload of outside oil entering its territory, it traced its source through railroad agents and moved swiftly to halt it. Standard Oil marketing men were known to trail competitors' wagons and undersell them if necessary. This unceasing drive, this implacable need to win, emanated from Rockefeller himself. When told that competitors had appeared in Saint Louis, he exhorted Oliver Payne, "Regret to hear that those parties have established an agency in St. Louis. We must not let them get the business. Why not make a good, hard, vigorous fight with the view of taking it all back again and not let them retain a foothold there, and the same in St. Paul."<sup>33</sup>

As the capstone of this system, Rockefeller fostered an extensive intelligence network, assembling thick card catalogs with monthly reports from field agents, showing every barrel of oil sold by independent marketers in their territory. From 26 Broadway, the titan could peer into the most distant corners of his realm. Standard Oil spies collected much of this information from grocers and railway-freight agents. One Cleveland refiner discovered that Standard paid his bookkeeper twenty-five dollars a month to provide information on his shipments, mailing these trade secrets to Box 164 at the Cleveland post office. Standard's reputation as a pervasive, all-seeing presence was richly deserved.

The manic vigor of Standard's salesmen becomes understandable in light of a secret policy that Archbold enunciated to Rockefeller in an 1891 letter. Station managers were expected to command at least 85 percent—and, if possible, much more—of the oil trade in their district, a punishing standard that goaded them into aggressive tactics.<sup>34</sup> Because they had carte blanche to reduce prices and use any other means necessary to hold the trade, they created pitched battles in many cities. One repentant Standard Oil marketer named Charles Woodbury recalled a favorite scare tactic. "Substantial rumors that the few independents surviving might not much longer be able to supply oil at all continually alarmed their customers."<sup>35</sup>

Rockefeller found nothing reprehensible about this intelligence network and could never understand the eternal fuss. "The practice of the Standard Oil Company in this regard brings no credit or discredit to the Standard Oil Company," he later told William O. Inglis. "It was following out a method in universal use by the largest and most intelligent distributors of goods the country over."<sup>36</sup> Some Standard Oil people, however, refused to stoop to these methods. When Charles Woodbury protested eavesdropping on competitors, his superior gruffly insisted, "We do not intend merely to grasp the situation—we must control it." Woodbury replied, "But this is espionage. I cannot stand over these men and make them go after these details."<sup>37</sup> After being censured for such squeamishness, he quit in protest. Recounting this in 1911, Woodbury left some tart comments about Rockefeller's assumed innocence. "Results were what the master asked for," he explained. "Details [Rockefeller] need not know. He could be left to his own self-effacement. He had selected his staff."<sup>38</sup> In short, Rockefeller posted the sales targets, whipped up the fervor, then foreswore any knowledge of the inevitable consequences.

To square his actions with his conscience—always a necessity for Rockefeller—he needed to invoke an overarching theme: vouchsafing cheap light to humanity. Touring a well drilled on Oil Creek in the early days, he stared at it silently and then intoned, "This is the poor man's light."<sup>39</sup> Such remarks weren't just for public consumption but were commonplaces in his correspondence. In 1885, he instructed a young colleague, Henry C. Folger, "Let the good work go on. We must ever remember we are refining oil for the poor man and he must have it cheap and good."<sup>40</sup> Having grown up in secluded farmhouses, reading by candlelight, he understood the revolutionary impact of cheap kerosene.

Rockefeller never had a single motive for any action and was surely motivated by more than altruism in championing cheap kerosene. He was obsessed with high-volume, low-cost production to maintain market share, even if he temporarily sacrificed profit margins. As he noted, "This fact the Standard Oil Company always kept in mind: that they must render the best service and be content with a largely increasing volume of business, rather than increase the profit so as to tempt others to compete with them."<sup>41</sup> When discussing prices with subordinates, he frequently reminded them, "We want to continue, in reason, that policy which will give us the largest percentage of the business."<sup>42</sup>

The public tolerated the trust's brawny tactics for a long time because it believed that it had, over the long run, cheapened kerosene and exercised a relatively benevolent dictatorship. As journalist Henry Demarest Lloyd wrote scornfully to George Rice in 1891, "Thus the public—dear fools—believe, and it entirely reconciles them—knaveish fools—to the piracies, treasons and murders by which the fabled cheapness has been brought to them."<sup>43</sup> Befuddled reformers assailed the trust for selling both too high and too low, for fleecing consumers and underselling rivals. As John Archbold summed up the paradox, "It is usually alleged that whenever the Standard, for whatever reason, advances its prices, it is oppressing the consumer, and when if, on the other hand, it lowers its prices, it is then oppressing its competitors."<sup>44</sup> Of course, both things were often true, since Standard Oil kept prices high where it faced no competition and low where it had to keep rivals at bay. On balance, the trust wielded its monopolistic power to keep prices artificially low to forestall competition.

In general, Standard Oil did an excellent job at providing kerosene at affordable prices. It boasted far lower unit costs than competitors and relentlessly drove down costs over the years. Between 1880 and 1885, its average cost of processing a gallon of crude oil went from 2.5 to 1.5 cents. In a rare 1890 newspaper interview, a supremely confident Rockefeller said that since Standard's birth twenty years before, the retail price of kerosene had plunged from 23.5 to 7.5 cents per gallon. Only half that drop, he contended, had resulted from the steep fall in crude-oil prices, and he credited the tank-wagon system for much of the savings. In the early 1900s, the Bureau of Corporations attributed most of the drop in kerosene prices to a sharp dip in crude-oil prices, not to Standard's superefficient management. Whatever the truth, the resulting low prices inoculated the public for a long time against the anti-Standard venom.

Many of Rockefeller's foes contended that routine underselling was his most lethal weapon, even more destructive than railroad rebates. As the industry's low-cost producer, Standard merely had to dump oil at cost to stamp out competitors. The practice of selling at or below cost, which started in the 1870s, intensified with the tank-wagon system, which permitted the trust to set retail prices. Hesitant to initiate price wars, which smacked of the old, Darwinian competition, Rockefeller said that he cut prices only defensively—that is, when forced to retaliate against price-cutting independents. When he did so, he showed no mercy against these reprobates and said with righteous indignation, "These people did not want cooperation. They wanted competition. And when they got it they didn't like it."<sup>45</sup>

Allan Nevins cited a federal study of predatory pricing that found that Standard Oil practiced it in only 37 of 37,000 towns serviced by its tank wagons and then only in response to cuts by competitors. Yet Rockefeller's files are so rife with references to this practice as to refute Nevins's verdict. In an 1886 letter, Colonel Thompson told Rockefeller that Standard sold at cost wherever competition appeared and compensated for the lost profits by raising prices in less competitive locales: "We find the outsiders mainly from Pittsburgh and the Oil Region had 2,000 barrels of oil in Cincinnati. . . . We have lowered the Cincinnati market an additional half cent temporarily to meet that competition and forced them to sell their oil without a profit." In contrast, he noted that with independents now banished from Chicago, "we jacked that price up a quarter or so, without multiplying instances, we are doing all around. The system is working well, better than any other we can devise and our feeling is to hold along on this basis—I beg you and the other gentlemen will keep in mind the fact that we are selling ¼ of all the oil we handle without a farthing of profit to this department."<sup>46</sup>

If Standard Oil sold one-quarter of all its oil at cost, as Thompson alleged, that would have meant anticompetitive price cuts in more than 9,000 towns — quite different from the 37 cited by Nevins. The trust used such infinite sleight of hand in setting prices, obscuring the real price through secret discounts, that a definitive accounting is impossible. Though many states had already outlawed predatory pricing, they found such a ban difficult to enforce. On this issue, Rockefeller remained an unreconstructed monopolist, defending Standard Oil’s price-cutting years later by commenting, “If in doing so they were losing money, which they made up on some of the specialties—they made up the difference—would it be a crime?”<sup>47</sup> Eventually, a national ban on such predatory pricing formed an integral component of antitrust legislation.

Standard’s policy of differential pricing also proved expedient in the global marketplace. During the 1880s and 1890s, trying to stem the tide of Russian and East Indian oil, the organization charged lower prices in Europe and compensated with higher American prices. Its tight control of the home market enabled it to prosecute savage price wars against the Nobels, Rothschilds, Royal Dutch, and Shell. For this reason, Standard Oil always considered its domestic monopoly a necessary precondition for its overseas conquests.

But Standard Oil never sought a perfect monopoly because Rockefeller realized that it was politically prudent to allow some feeble competition. As he admitted, “We realized that public sentiment would be against us if we actually refined all the oil.”<sup>48</sup> The combine ceded about 10 percent of the refining and marketing business to a tiny group of fringe rivals. Even in the mid-1880s, ninety-three mostly marginal refineries were allowed to operate. A very smart monopolist, Rockefeller kept prices low enough to retain control of the market but not so low as to wipe out all lingering competitors.

We must retire one common canard about Rockefeller: He didn’t set crude-oil prices through blanket edicts. In his correspondence, one sees the oil king trying to guess the trend of crude prices and bemoaning speculation. As he told one of his personal financial advisers in 1882, crude oil “is about the worst commodity in the world to speculate in. . . . It is about as uncertain as railroad stocks.”<sup>49</sup> Perhaps the chief way that Standard Oil influenced crude prices was by elevating or dropping storage charges at its pipelines, which the firm sometimes used to break speculative raids. By issuing certificates against oil stored by its pipelines, it stimulated a free market in crude oil, and hundreds of thousands of people speculated in or borrowed against these certificates, creating the first oil-futures market and setting the trend for spot prices. After the National Petroleum Exchange opened in Manhattan in late 1882, the speculators far outweighed the trust in importance in pegging prices.

As Rockefeller boasted, Standard Oil was an infallible moneymaker. In the late 1880s, Henry M. Flagler testified it had average earnings of 13 percent a year on net assets, which considerably understated its performance. When Teddy Roosevelt’s Bureau of Corporations later examined the matter, it computed a more handsome 19 percent return from 1882 to 1896. Rockefeller defended these high returns as justified by the fear that the oil might run dry and render the trust’s vast investment worthless. He knew public opinion was inflamed by the exorbitant dividends declared on Standard Oil shares, which sometimes ran as high as 200 percent. These figures were misleading, Rockefeller argued, since Standard Oil’s actual capital was typically ten times its official capitalization. In terms of real capital, the 200 percent dividend declared in January 1885 was more like 20 percent—extremely high but not astronomical. Such a rich but not altogether outrageous return was just what the politic Rockefeller wanted.

Rockefeller knew that if he got greedy, other products could be substituted for kerosene, and this, too, curbed his appetite for excess profits. Oil was just one of many fossil fuels and kerosene one of many potential illuminants. In the fall of 1878, America’s wunderkind, Thomas Alva Edison, boasted to reporters at Menlo Park, New Jersey, that he had dreamed up a practical electric lightbulb; within a year, he had created a miraculous bulb that glowed brightly for one hundred straight hours and directly threatened Rockefeller’s kerosene business. The new Edison Electric Light Company enlisted affluent bankers, including the august Drexel, Morgan and Company. On September 4, 1882, Edison stood in J. P. Morgan’s offices at 23 Wall Street and threw a switch that brightened Morgan’s office with electric lighting, inaugurating a generating plant in lower Manhattan. Luckily for Rockefeller, the lightbulb didn’t instantly drive out kerosene: It took time for Edison to cover the country with power stations, and by 1885 only 250,000 lightbulbs shone across America.

Instead of electric light, the soft, shimmering glow of gaslight began illuminating many American cities in the 1880s. For a long time, natural gas had been discarded by oilmen as a waste product until a business group led by J. N. Pew piped natural gas to Pittsburgh in 1883. Quick to perceive that natural gas complemented the oil business, Rockefeller advised Daniel O’Day that Standard Oil should develop its own strength in this area rather than turning to outsiders. O’Day and his ebullient team assured Rockefeller that they could pipe explosive gas long distances without mishaps. Within two years, they were piping gas from western Pennsylvania to cities in Ohio and New York, and by the late 1890s Rockefeller secretly oversaw natural-gas companies in Titusville, Oil City, Buffalo, and thirteen other localities. As one newspaper said, “Consumers in some of these places would be surprised to learn that they are burning Standard Oil gas.”<sup>50</sup>

To counter competition from gaslight, Edison based his promotional scheme upon a moral and aesthetic contrast between good electric light and evil gaslight. Of the flickering gaslight that later generations found so enchantingly poetic, he sneered, “It is a nasty, yellow light, too, and far removed from the color of the lovely natural light,” while he touted the “soft radiance” of electric lights as “singularly powerful and even . . . perfectly steady.”<sup>51</sup> With a persistence worthy of Standard Oil’s crusaders, Edison sales agents approached customers using “outmoded” gas jets and urged them to switch to advanced electric lamps.

The promotion of natural gas involved Rockefeller in sanguinary battles, for the major customers were municipalities, and the decisions were always highly political. The natural-gas business fed rampant corruption, a veritable cornucopia of graft, as companies manipulated urban officials to get these franchises. Though Rockefeller regularly denied knowledge of such machinations, his papers tell a different story: He exercised a supervisory role and knew all about the money funneled to politicians. In securing the Detroit franchise, Standard Oil furnished an emissary, G. A. Shelby, with \$15,000 in cash and \$10,000 in gas stock to sway politicians. When payment came tardily, Shelby groused to Rockefeller: “Will you guarantee the amount stated if Ordinance passes and is approved by the Mayor. . . . I have been to considerable expense and want to be sure of prompt settlement when work is completed.”<sup>52</sup>

In the natural-gas battles, the porous boundaries between politics and business began to crumble and disappear. In 1886, Daniel O’Day met behind closed doors in Philadelphia with the rival Columbia Natural Gas Company and fairly gasped at the political luminaries who were represented. As he

told Rockefeller, “I was astonished to learn the people who are in it. All of the Republican local politicians of Philadelphia are stockholders. They are very much afraid of their investment, and feel now that unless they make some alliance with us that they will in all probability lose all their money, or a great share of it.” From pure expediency, O’Day favored a deal with their rivals, telling Rockefeller, “The feeling generally was to push the co. to the wall, a feeling in which I would fully share, were it not for the fact that the stockholders of the company might be very bad enemies to have in the Penna. legislature next winter.”<sup>53</sup> Unconvinced by such pragmatic reasoning, the executive committee overruled Day.

The most bitter natural-gas fracas erupted in Toledo, Ohio, where the former governor, Charles Foster, was an old boyhood friend of Flagler and a recipient of Standard Oil campaign largesse. In July 1886, O’Day reported to Flagler that the ex-governor had agreed to merge his Fostoria Illuminating Gas Company with the Standard’s Toledo gas start-up to form the Northwestern Ohio Natural Gas Company. O’Day relayed the secret terms of this arrangement: “That Gov. Foster be President of the Co. But that we would have full control of management.”<sup>54</sup> Toledo citizens were delighted when the Eastern Ohio Natural Gas Company decided to vie with Northwestern for a gas franchise; in a compromise settlement, both companies received franchises. Then it surfaced that *both* rival companies were controlled by Standard Oil, and in the ensuing brouhaha city officials decided, in retaliation, to erect their own municipal gasworks. Politicians in the Gilded Age tended to dispense with euphemisms, preferring cash on the barrelhead. Having done Standard Oil’s bidding in the gas business, Foster demanded his payoff from Rockefeller in January 1888, saying his campaign committee had a debt of almost \$1,200. “My suggestion to you,” he told Rockefeller bluntly, “is that you send me a cheque for this amount. . . . I have refused to ask you or your people for contributions for several years past. In this case I did it because I know that you feel an interest with us, and for the further reason that I thought it would be helpful in warding off the blows made at you, and at our Gas Co.”<sup>55</sup> In reply, Rockefeller sent Foster a thousand dollars, though he couldn’t resist appending some barbed comments on his past performance. “Our friends do feel that we have not received fair treatment from the Republican Party, but we expect better things in the future.”<sup>56</sup>

In 1886, Standard Oil set up the Natural Gas Trust, with Rockefeller as its largest shareholder. As such, he presided over these sordid municipal skirmishes, albeit keeping a sanitary distance. He followed matters closely but never soiled his hands, so that he could profess ignorance of the whole matter.

If Rockefeller tried to deny responsibility for his more deplorable actions, he had legions of critics who loudly proclaimed that he had maliciously ruined them. As Ida Tarbell noted, his foes endowed him with superhuman powers. “Strange as the statement may appear, there is no disputing that by 1884 the Oil Regions as a whole looked on Mr. Rockefeller with superstitious awe.”<sup>57</sup> Each day’s mailbag brought more invective from total strangers who cursed him and pleaded for relief. The most bile flowed from western Pennsylvania oilmen who believed that he capriciously decreed crude-oil prices each morning. As one Bradford producer told him, “The situation here is truly alarming and hundreds of families are in actual distress that need not be if the price of oil was what thousands believe you could make it.”<sup>58</sup> Another correspondent warned him, “There are thousands here on the verge of financial ruin on account of the low price obtained for their product, and *if it is within your power* to give them a better price you would bestow a boon inestimable in its value to this entire country.”<sup>59</sup> Sometimes these malcontents seemed torn over whether Rockefeller was Satan or Santa Claus, as shown by this muddled query from P. O. Laughner:

*I am a poor devil of a pyker on the oil market and have been in the business for eight years. During all this time I have been cursing the Standard Oil Company with the rest of the boys—curses loud and deep. But with all the anathemas hurled at it the S.O.C. is still in existence and continues to pile up enormous wealth. Now as the market is completely dead and my occupation gone, I have come to the conclusion that it would be wisdom to stop cursing the Standard and strike it for a good fat position.*<sup>60</sup>

After his scandal-ridden childhood with Big Bill, Rockefeller had a fine instinct for enemies and was sensitive to this crescendo of criticism. When out for a walk, he was vigilant and preternaturally aware of anyone following him; it was impossible to sneak up behind him. Yet he lent no credence to his critics and regarded their putative idealism as a flimsy cover for selfish motives. Rockefeller saw himself stoically suffering the fate of all revolutionary figures. “The ideas on which we worked were new . . .,” he explained. “But knowing that we were right, we went steadily about our business, founded on ideas that were an irresistible force.”<sup>61</sup> He identified many critics as competing refiners who had foolishly taken cash instead of Standard Oil stock for their plants. His melodramatic rendition of it was this: “We think about Hades. What more can punish a man than to sit and groan as he contemplates what might have been!”<sup>62</sup>

Despite being the target of so much public obloquy, Rockefeller seemed fearless. “The word ‘fear’ is not found in my father’s vocabulary,” his son once said, “nor does he know what the sensation is.”<sup>63</sup> Junior recalled being driven to a train station in Manhattan by his father at a time when he was swamped by anarchist threats. Though Junior begged him to hire bodyguards, his father scoffed:

*“Why John,” he said, “I can protect myself. If any man should be foolish enough to attack me—well.” . . . He did not boast. I have never heard him boast. But he stood up full height with his fists clenched. What he said was to the effect that if anyone should attack him he was feeling sturdy—and he hoped he wouldn’t hurt the poor fellow too much.*<sup>64</sup>

Junior remembered the evening in Cleveland years earlier when a maid shrieked that a burglar was upstairs. Rockefeller unhesitatingly seized a pistol and strode to the back door, hoping to nab the burglar, who had already slipped down a post and escaped.

Rockefeller professed that he bore no malice toward critics and approached them in a spirit of Christian tolerance—so long as they conceded their error. To those “who repented their attacks and abuse we freely extended forgiveness, as we ourselves might hope for mercy and forgiveness from a higher source,” he said.<sup>65</sup> As his private life and philanthropy attest, he was not a cruel man and did not have sadistic impulses. Yet he countered critics with ad hominem attacks and frequently referred to their actions as schemes, implying something devious and illegitimate. Whenever he was about to commit some particularly heinous act, he first found a character flaw in the victim then proceeded with a serene conscience.

Proof against criticism, Rockefeller nonetheless provoked a small army of gadflies. Perhaps the most picturesque was Lewis Emery, Jr., the rich

Bradford producer and pipeline owner and a Pennsylvania legislator, who served as a major source for Ida Tarbell. If only Rockefeller had played fair, Emery insisted, *he* would have ended up the more powerful oilman. “I had and have as much brains as John D. Rockefeller, but I have never had his cunning nor his ability to use unscrupulous means or unscrupulous men to carry out a programme,” he maintained.<sup>66</sup> Though he spent much of his life stalking the titan, he never actually met Rockefeller, who was, he explained, “too much in the background, too cunning.”<sup>67</sup>

Standard Oil applied merciless measures to stop Emery’s pipelines from linking up with railroads, as shown with his Equitable pipeline to Buffalo. In 1892, Emery was about to complete a major pipeline to Hancock, New York, where he expected the Ontario and Western Railroad to pick up his oil and transport it to New York City. When Archbold got wind of this, he demanded a showdown with the railroad. His report to Rockefeller shows the lengths that Standard Oil would go to cripple a competitor:

*We have had further interviews with the Ontario & Western people, and feel that we have made some progress toward a possible understanding with them. It is now entirely sure that there has been no definite engagement entered into by them with the Emery party, and we think they are now convinced that the rates they had been talking about with the Emery party are absurdly low, and that business on any such basis would be undesirable and unprofitable. We have made them a proposition of business covering a period of five years, and expect an answer from them this week. Our proposition is that we put over their lines 400,000 barrels of oil yearly, or, in default of any part of the amount, pay a penalty of 10 per cent of the existing rates. We think it a very liberal proposition to them.*<sup>68</sup>

Standard Oil was not content to advance its own interest; it worked actively to damage the business interests of its adversaries. Rockefeller’s papers also reveal that Emery was prepared, at one point, to sell his oil properties to Standard Oil, asking for \$750,000 in shares of the trust—hypocrisy that only validated Rockefeller’s dim opinion of his critics.

Another embittered foe was George Rice, a Vermont native and independent refiner from Marietta, Ohio. A vigorous man with a bulldog face, Rice thrived on crossing swords with the oil trust. More than anyone else, Rice was driven mad by Standard Oil’s unjust methods and became a professional Rockefeller hater. He instigated many legislative probes of Standard Oil and in 1881 published a pamphlet entitled *Black Death*, an anthology of scathing newspaper exposés. For Rockefeller, Rice was nothing but a blackmailer. “He liked to harass, embarrass, annoy the Standard Oil interests with a view of enabling him to sell his quite unimportant refinery interest. . . . This is the whole story of George Rice.”<sup>69</sup> In fairness to Rockefeller, Rice tried repeatedly to extort money from him, asking an outrageous \$250,000 for a refinery Rockefeller valued at only \$25,000. To banish this pest, Rockefeller and his colleagues alternated between trying to buy him out and trying to bludgeon him to death. As Colonel Thompson reported to Rockefeller, “[Rice] admitted that it could be better to occupy friendly relations with us and assumed to be willing to make some arrangement, but extortion was written in every lineament of his countenance and burdened every syllable that fell from his lips.”<sup>70</sup> At the time, Rice was lobbying for a federal investigation of Standard Oil’s railroad rebates.

Though Rice insisted that Standard Oil laid deep plots against him, Rockefeller mocked his criticism as the ravings of an overactive mind. “We might as well assume that the Standard Oil Company would get a 21-inch cannon to shoot mosquitoes.”<sup>71</sup> Yet his files show that such a cannonade was fired at Rice. In 1885, Daniel O’Day struck a deal with the Cleveland and Marietta Railroad, which was the lifeline of Rice’s refinery. The railroad agreed to charge Standard Oil 10 cents a barrel versus 35 cents for Rice and his fellow independents. Resurrecting the infamous drawback, Standard would also be paid 25 cents for every barrel that Rice shipped. In dictating this deal, O’Day bluntly warned the railroad that if it didn’t comply, he would build a competing pipeline and drive them out of business. In a rare successful suit against the trust, Rice forced Standard Oil to repudiate the nefarious contract and refund him \$250.

With his own brand of courage, Rice tried to market oil against the two roughest Standard Oil subsidiaries, Chess, Carley and Waters-Pierce. As soon as Rockefeller got reports of even minuscule shipments made by Rice, Standard Oil agents in the affected states were told to thwart him by any means necessary. In 1885, W. H. Tilford told Rockefeller, “As far as Chess, Carley Co.’s territory is concerned, every effort is being made to dislodge Rice. Travelling men are being put upon the road, who go from station to station selling oil in competition with any oil which Rice may have in the various towns.”<sup>72</sup> Every time Rice was ejected from another hamlet, Rockefeller was informed. “We have recently driven Rice entirely out of Anniston, Alabama, and feel that we shall soon have him also out of Birmingham,” the Chess, Carley treasurer reported to Tilford. “Wherever this result is accomplished, however, it has only been by our making very low prices, frequently at a loss to this company, and such loss continued through a long period.”<sup>73</sup> No threat to his empire was too small for Rockefeller to overlook.

If Emery, Rice, and other anti-Rockefeller mavericks made little headway in the oil industry itself, they were destined to have a powerful impact in the court of public opinion as they coalesced into an influential lobbying group. They formed a ready source of information for journalists, of whom their first polemical champion was a rich, elegant newspaperman named Henry Demarest Lloyd. The son of a Dutch Reformed minister, Lloyd attended Columbia College, passed the New York bar, then married into the wealthy Bross family, co-owners of the *Chicago Tribune*. Starting in 1878, Lloyd wrote withering editorials about Standard Oil in a florid style that captured the public’s imagination. He profited from the flood of revelations produced by the Hepburn hearings in New York and the Pennsylvania lawsuits against Rockefeller. In the March 1881 issue of the *Atlantic Monthly*, editor William Dean Howells published Lloyd’s mordant account of Standard Oil entitled “Story of a Great Monopoly.” The first serious exposé of the trust in a prestigious, mass-circulation magazine, Lloyd’s seminal article was a sensation, and the issue went through six printings.

For Lloyd, the essence of Standard Oil power resided in its secret alliances with the railroads, which had fostered the growth of many trusts. While conceding the “legitimate greatness” of Standard Oil, he said that it only made its ethical shortcuts the more reprehensible. “Their great business capacity would have insured the managers of the Standard success, but the means by which they achieved monopoly were by conspiracy with the railroads.”<sup>74</sup> A vociferous critic of William H. Vanderbilt, Jay Gould, Tom Scott, and Collis Huntington, Lloyd incorporated his critique of Standard Oil into a comprehensive crusade for railroad reform. He also fastened public attention on John D. Rockefeller as the trust’s embodiment, speculating that only William H. Vanderbilt had earned more money the previous year.

Lloyd was a slipshod reporter, and his account is marred by many inaccuracies. At one point, he says that Rockefeller had owned a Cleveland flour

store. Yet he wrote lapidary prose and showed a keen political and cultural understanding. In a cunning stroke, he converted the piece into a consumer story, stating at the outset, “Very few of the forty millions of people who burn kerosene know that its production, manufacture, and export, its price at home and abroad, have been controlled for years by a single corporation—the Standard Oil Company.”<sup>75</sup> For Lloyd, the octopus—he helped to popularize the nickname—did more than threaten free competition and fair play; it jeopardized American democracy itself. He charged that Standard Oil controlled two U.S. senators and had engaged in so much corruption in Harrisburg that it had “done everything with the Pennsylvania legislature except to refine it.”<sup>76</sup> A superb phrasemaker, Lloyd declared in a rousing finale that “America has the proud satisfaction of having furnished the world with the greatest, wisest, and meanest monopoly known to history.”<sup>77</sup>

The article introduced Rockefeller to a national audience and fixed antitrust legislation high on the reform agenda. In proposing a federal agency to ensure uniform railroad rates, Lloyd anticipated the Interstate Commerce Act by six years. If his attack was a harbinger of things to come, so was Rockefeller’s total silence. Confident that posterity would vindicate him, the latter would later explain, “I was concentrated upon extending and developing and perfecting our business, rather than on stopping by the wayside to squabble with slanderers.”<sup>78</sup>

In common with many contemporary moguls—including J. P. Morgan, Andrew Mellon, James Stillman, Henry Clay Frick, and George F. Baker—Rockefeller resented the press, and his ferocious allegiance to his concern transcended other claims on his conscience. One of his favorite refrains was “The Standard Oil Company’s business was that of saying nothing and sawing wood.”<sup>79</sup> During the antitrust furor of 1888, he told one minister, “We have gone upon the principle it were better to attend to our business and pay no attention to the newspapers, with the idea that if we were right they could not permanently injure us, and if we were wrong all their comments, though favorable, would not make it right.”<sup>80</sup> Rockefeller asserted that he was less afraid of exposing misbehavior by talking to the press than of inadvertently spilling trade secrets. “What could we say,” he asked rhetorically, “without telling the world just how we were making our success?”<sup>81</sup>

Those few intrepid reporters who tried to penetrate Standard Oil often gave up in despair. When the *New York Sun* dispatched a reporter to Cleveland in 1882 to investigate Rockefeller, he could not get near the mogul and was stunned by the layers of secrecy that surrounded him. He was further impressed by the silence of hundreds of Standard Oil employees he buttonholed, all schooled in Rockefeller’s philosophy. Even with friendly journalists, Rockefeller would not supply a photo of himself in an oil field or refinery and banned photographers from his home for even the most innocuous magazine spreads. Of course, this invisibility only piqued the public’s interest. That silence came so easily to Rockefeller should not surprise us. As an inner-directed man, he required no approbation from others and was much too circumspect to toss out opinions in a newspaper interview.

By the mid-1880s, facing severe political assaults, Standard Oil could no longer decline all press contact. In 1885, the *Oil City Derrick*—long a heated critic of the trust—was bought by an intimate of Captain Vandergrift, who installed Patrick Boyle, a Standard Oil adherent, as its editor. Around 1887, Standard Oil hired a press bureau called the Jennings Publishing Company to place favorable ads, disguised as independent articles, in Ohio newspapers. Soon the Standard cooperated selectively with other periodicals. When *Harper’s Weekly* profiled Rockefeller in 1889, the article was first thoroughly vetted by Archbold. On those odd occasions where Rockefeller sat for interviews, he came across as unfailingly dignified and courteous. In 1890, a reporter for the *World* described him as a man “with an intelligent and pleasant countenance, fair complexion, sandy hair and mustache intermixed with gray, a somewhat prominent nose, mild gray eyes, and an agreeably expressive mouth.”<sup>82</sup> The next year, another reporter, braced for a bloody ogre, said of Rockefeller, “He is modest, retiring, gentle-mannered, and without the human vanities which we associate with great millionaires.”<sup>83</sup> This favorable coverage should have alerted Rockefeller to two critical facts: that even hostile reporters could be swayed and that he had a flair for public relations no less pronounced than his gift for making money.

Some of the most pungent criticism came from within Standard Oil’s own ranks, from isolated subordinates who thought that the trust’s muscular tactics offended Christian principle. In the 1870s, Rockefeller recruited a stout, bewhiskered young man, William Jay Cooke, a grandnephew of Jay Cooke, whom he had befriended at the Cleveland YMCA. A former wholesale milliner, Cooke prospered at Standard and was soon elevated to a manager’s post in Toledo. After three years, he suddenly quit, unable to reconcile the trust’s sales tactics with his Christian faith. As a history of Standard of Ohio notes tactfully, “He didn’t see eye to eye with Mr. Rockefeller in the manner of eliminating competitors.”<sup>84</sup> Unfortunately, we don’t know how Rockefeller reacted to this defection by a devout protégé.

Perhaps the most extraordinary act of contrition in Standard history came in an eloquent appeal to Rockefeller written by William G. Warden on May 24, 1887. One of the trust’s most senior figures, Warden sent Rockefeller a haunting letter regretting the revulsion that the firm inspired in the popular imagination:

*We have met with a success unparalleled in commercial history, our name is known all over the world, and our public character is not one to be envied. We are quoted as the representative of all that is evil, hard hearted, oppressive, cruel (we think unjustly), but men look askance at us, we are pointed at with contempt, and while some good men flatter us, it’s only for our money and we scorn them for it and it leads to a further hardness of heart. This is not pleasant to write, for I had longed for an honored position in commercial life. None of us would choose such a reputation; we all desire a place in the good will, honor & affection of honorable men.*<sup>85</sup>

After advancing a profit-sharing plan that might assuage the hostility of the oil producers, Warden urged Rockefeller to ponder his letter:

*Don’t put this down or throw it to one side, think over it, talk with Mrs. Rockefeller about it—She is the salt of the earth. How happy she would be to see a change in public opinion & see her husband honored & blessed. May he who’s [sic] wisdom alone can put it in our hearts to love our fellow men, guide and direct you at this time. . . . The whole world will rejoice to see such an effort made for the people, the working people.*<sup>86</sup>

The Warden letter is an exceptional statement, as dramatic in its way as a deathbed confession. It also confirms that Cettie Rockefeller was extremely upset by the opprobrium heaped upon her husband. And how did Rockefeller respond to this brave, thoughtful letter? About to sail to Europe with his family, he employed his departure as an excuse to send a short, platitudinous reply: “I have not been able to write you sooner,” he wrote the following

week, “nor to give a careful consideration but be assured its content will not escape me.”<sup>87</sup> To cool off a tense situation with a bland note was vintage Rockefeller, and there is no evidence that he ever again communicated with Warden on the subject.

## Widow's Funeral

As John D. Rockefeller was busy consolidating America's largest industrial empire, his father, William Avery Rockefeller—a.k.a Dr. William Levingston—was showing his old wanderlust, peddling panaceas under his assumed name. A frontiersman in a nation where the frontier was vanishing, he gravitated to wilderness areas that provided asylum from the modern, industrial world epitomized by his son.

Huge patches of Bill's life remained a mystery to earlier Rockefeller biographers, but a rough portrait of his later years can now be sketched from Rockefeller's papers and some previously overlooked newspaper and magazine accounts. Bill had relatively little contact with his rich sons, John and William, but was extremely close to the envious Frank, who shared his love of fishing and hunting. (Perhaps associating these sports with his prodigal father, John never hunted or fished in later years.) After Frank bought an immense ranch in Kansas in the 1880s, his father was a frequent guest, and they hunted quail and prairie chickens together.

Much of what we know about Bill's later years derives from his remarkable friendship with a surrogate son, Dr. Charles H. Johnston. When Charles was a baby in 1853, Dr. Levingston visited his Ontario home and cured his mother of an illness. In 1874, Charles, now a young man, encountered Bill in Wisconsin, where Bill cured him of a fever and promised to tutor him in the "art of healing." In Freeport, Illinois, Johnston met Mrs. Margaret Allen Levingston and later called her "one of the sweetest women I ever knew."<sup>1</sup>

It might have been Charles Johnston's appearance that suggested to Bill a scam tailor-made for the Indian reservations. Before meeting Johnston, Bill had fallen back on his old deaf-and-dumb peddler routine. Native Americans believed that when the gods deprived people of one sense, they granted them supernatural healing powers in return, and this made them easy targets for Bill's act. Now he spotted a new opportunity. Charles Johnston had high cheekbones, nut-brown skin, and flowing black hair and could easily be mistaken for a Native American. Bill hired him as his assistant, decked him out in splendid feathers and war paint, and featured him as his adopted Indian son. From the back of his wagon, Bill told his spellbound audience that Johnston, an Indian prince, had learned secret medicinal formulas from his father, a great chieftain. It was testimony to Bill's gall that Johnston had to pay him for this apprenticeship in fraud. "In spite of his friendship and liking for me," Johnston said, "he made me pay him \$1,000 for my tuition, which illustrates his shrewdness as a bargain driver and his love of money."<sup>2</sup> As he had once done with John, Big Bill toughened Johnston by goading and cheating him at every turn. One is left to wonder whether Bill saw in Johnston a substitute son who might fill the large emotional void left by his formerly adoring eldest son.

As he traveled with Johnston across Illinois, Minnesota, Iowa, and the Dakotas, Bill's business methods deviated little from the methods he had honed in upstate New York. As Johnston recounted after Bill's death: "He would drive into a town, scatter handbills in which the great Dr. Levingston asserted that he could cure all diseases and we would have a suite of rooms at the best hotel and to the doctor there would come the sick and the halt and the lame. In all cases of common ailments he could detect the cause almost at a glance."<sup>3</sup> To impress yokels, Bill wore a glittering diamond in his shirtfront, although when negotiating hotel rates he covered it up to get the cheapest deal. According to Johnston, he pulled in hefty profits, sometimes \$200 a day, and gave the false impression that he was worth several hundred thousand dollars. As in earlier years, Bill dabbled in commodity speculations. At one point, he bought fifty thousand bushels of corn and stored them in bins, selling the lot for a steep markup when grasshoppers devoured crops the following summer. Johnston always admired this colorful, rough-hewn character with his bottomless bag of tricks. "He was all business and his mind was centered on the almighty dollar."<sup>4</sup>

At first, Johnston did not know that Dr. Levingston was related to the Rockefellers, though he noticed a recurring obsession with John D. Rockefeller, whom Levingston claimed to visit in Cleveland once or twice a year. "He told me he went there to look after his money invested with John D. Rockefeller, and he would tell me wonderful stories of John, his shrewdness and great wealth." One time, a skeptical Johnston asked Bill how he knew this famous personage. "I started John D. Rockefeller in the oil business," Bill said flatly. "I loaned him the first money he invested in it and I helped him all along." Bill boasted that his Standard Oil investment was now worth \$375,000. "He used to say that he made John D. rich and he told me if I would stay with him and do as he said he would make me rich, too."<sup>5</sup> At first, it never dawned on Johnston that Bill was Rockefeller's father, for the braggadocio seemed part of his carnival-barker blarney, but when Bill began to chatter about old man Davison, Johnston recognized the name of Rockefeller's maternal grandfather and began to wonder. He remained suspicious for several years, while Bill resolutely denied the truth, scattering hints all the while.

In 1881, John D. agreed to buy his father a 160-acre ranch in Park River, North Dakota, on a simple condition: that he never take Margaret Allen there. (Bill spent winters with her in Freeport.) Never resigned to his father's desertion and always fearing press exposure of his bigamy, John was still trying to lure his seventy-one-year-old father back to Eliza and away from the sinful second marriage. Johnston later explained how Dr. Levingston had told him "that John D. Rockefeller early had learned that his father was a bigamist, and that the ranch in North Dakota had been taken by [him] upon the advice of John D., who, in the later years of his father's life, wished to wean him away from his second wife and have him live alone in a secluded place. Thus, if the old man should be discovered on his ranch, there would be no second wife with him."<sup>6</sup>

When Bill bought his first parcel of land in Park River, John allowed him to hold it under the name of Levingston. But when he purchased additional acreage in 1884, the deed was conveyed to Pierson Briggs, John's brother-in-law and a Standard Oil purchasing agent. In all likelihood, John paid for the property, using Briggs as a blind. When the land was conveyed back to Bill in 1886, he had to sign the transfer document "William Avery Rockefeller," though he was known locally as Levingston, and one suspects that John insisted upon this step to strip Margaret Allen of any legal claim to the property. It was this legal maneuver that later established incontrovertibly that William Levingston and William Rockefeller were the same person.

For a long time, Bill and Charles Johnston occupied adjoining properties in Park River and spent lazy summers hunting and fishing. Their secluded town, thirty miles from the nearest railroad, gave Bill exactly the protective distance from sheriffs and medical societies that he required. During the

sixteen summers he spent there, Bill shunned the main roads of town and carved out paths through the wheat fields. The townsfolk found him a queer, solitary old buzzard. Now and then, unaccountably, he cashed a Standard Oil check at the local bank. If the check was for \$3,000, he might throw up his hands in mock surprise and pretend he had thought it was for only \$300, as if someone of his wealth could afford to be negligent with money.

Later on, when he became a physician of distinction and president of the College of Medicine and Surgery in Chicago, Charles Johnston feared legal repercussions for his earlier gypsy wanderings with Bill and sought to portray him as a genuine folk healer instead of as a bald-faced quack. But neighbors had little doubt that Doc Levingston and Johnston were first-class bunco artists. “They had a big jug full of medicine and they treated all diseases from the same jug,” one acquaintance recalled. “I have often heard them joking together about the cure-all properties of the mixture in that jug. Dr. Levingston would say, ‘Yes, sir, that medicine will cure anything, providing the patient has got \$5 to pay for a bottle of it.’”<sup>7</sup> In this distant hamlet, Bill functioned as a medical factotum, rigging up a funny gadget that pulled an aching tooth for a buck, and he even did some horse doctoring.

Johnston might never have unearthed the startling truth about Doc Levingston had it not been for a freak accident soon after they moved to Park River. They were constructing a cattle shed together when Bill injured himself lifting a heavy bar. Gasping in agony, he feared that he had a ruptured intestine and that death might be imminent. When Johnston asked if he should notify Margaret, Bill snapped, “I don’t want the Allens to get any more of my money than I can help.”<sup>8</sup> (Relations with the Allens were apparently no more cordial than with John Davison.) Instead, Bill blurted out a shocking confession: He was the father of John D. Rockefeller, who should be informed in case he died. “No, you notify John D. Rockefeller, but be very careful and let no one else know it.”<sup>9</sup>

When the injury wasn’t fatal and Bill recovered, he tried to resume the tired old charade that he was unrelated to Rockefeller, but Johnston’s hunch had now ripened into certainty, and Bill eventually gave up the game. Bill began to speak freely and often quite emotionally about his estranged son. When Johnston asked why he had concealed this relationship for so long, “he told me that the reason he kept it secret was that he found it necessary in his younger days to assume a name because he was practicing medicine without a license, he might be arrested any time, and he did not wish to disgrace the name of Rockefeller because of his children. He stuck to the name later, he said, because it was then too late to honorably take the right name.”<sup>10</sup> This overlooks the awkward truth that he also assumed a new name to enter into a bigamous marriage with Margaret Allen and conceal the truth from Eliza.

The stories about John D. suddenly came tumbling forth. Bill bragged about his career, always reserving a good deal of credit for himself. “He never tired of boasting to me of John D.’s cleverness and how he was too smart for any of his competitors in the business. . . . He seemed to just dote on John D. Rockefeller. He told me hundreds of anecdotes of John D.’s boyhood, of fishing and hunting with him and of his cleverness and shrewdness as a boy.”<sup>11</sup> For all of Bill’s glaring faults, there is something touching about a father admiring his extraordinary son from afar and taking vicarious pleasure in his achievements while being pointedly excluded from his affections. John’s success provided its own tacit commentary on Bill’s employment. Where Bill had squandered his considerable talents, John had succeeded on a scale that made Bill look cheap and tawdry. Like many pathological liars, Bill’s achievements were too meager to satisfy his exaggerated need to feel important. He had never arrived at a larger vision of his own potentiality, remaining mired in the petty arts of a small-time con man.

Charles Johnston finally wearied of his escapades with Bill and opted for a legitimate career. Like any Pied Piper, Bill was upset when one of his followers no longer hearkened to his beguiling tune. As Johnston remembered: “We parted when I decided to go to college and get a medical education and a diploma. He was very indignant at that. He declared that a college education would spoil me and that his was the only method of curing diseases.”<sup>12</sup> Bill later recanted and helped to put his young protégé through medical school. When Johnston began practicing medicine in Chicago, Bill visited and showered him with gifts, including his gold-headed cane and his violin. In the interest of protecting his newfound respectability, Johnston kept his frontier liaison with Bill a deeply buried secret until the press forced him to come clean in 1908. By this point, the search for Doc Rockefeller had developed into a national obsession.

In March 1889, the ailing Eliza was at William’s mansion at 689 Fifth Avenue when she suffered a stroke that paralyzed her right side. As she hung on for another ten days, both John and William skipped work to maintain a bedside vigil. “She knew us all,” John D. wrote of the deathbed scene to a cousin, “and did all her strength would permit to show her affection, appreciation, and Christian resignation.”<sup>13</sup> She died quietly on March 28, age seventy-six, never having known that her husband had taken a second wife, twenty years his junior, and adopted a brand-new identity. John, William, and Frank buried their differences long enough to accompany the casket by train to Cleveland.

Whatever solace John derived from Eliza’s peaceful death was soon shattered by the events surrounding her funeral. Never accepting Bill’s double life, John had sold his father’s lot in Woodland Cemetery in 1882 so that he could be buried in “the portion for him and Mother” in the Rockefeller family plot at Lake View Cemetery. This transaction required Bill’s signature, but John’s relations with his father were so uneasy that he had to ask brother Frank and Pierson Briggs to act as intermediaries. When Doc Rockefeller predictably bridled at this slap at his second marriage, John threw up his hands in frustration. “Guess you will have to manage this matter with him,” he told Frank.<sup>14</sup> John succeeded in making the transfer, for, as Eliza’s condition deteriorated in February 1889, he wrote to Frank and referred to “the arrangement for father and mother to be buried in that portion which we have designated as theirs.”<sup>15</sup> Perhaps Bill pretended to submit to this arrangement only to placate John, for he had no real intention of being buried beside Eliza or abandoning Margaret.

When Eliza’s death seemed imminent, Frank alerted John that their father was suffering from asthma and would not attend the funeral service, to be held at John’s old Euclid Avenue house. Something snapped in John when his father thus offended his mother’s memory, and he decided to kill him off, at least symbolically. The day before the funeral, he paid a visit to the Reverend George T. Dowling of the Euclid Avenue Baptist Church, who would officiate at Eliza’s burial and deliver the oration. As someone who later discussed this meeting with Dowling recalled, “The most interesting fact I got from him was the pains John D. Rockefeller took to have it announced that his mother died a widow. Among other things he told of the years of widowhood and her faithfulness to the memory of her departed husband.”<sup>16</sup> That this story was gathered by Rockefeller’s official biographer, William O. Inglis, only adds to its credibility.

Eliza's sons and grandsons served as pallbearers at the funeral, and John read the final chapter of Proverbs, while Bill was conspicuously absent among the mourners. Eliza's death certificate kept up the fiction that she was a widow. After the funeral, John was still fuming over his father's absence and for weeks insisted that Bill should come to Cleveland to pay his last respects at the gravesite. On April 18, 1889, he told Bill's brother Egbert, in an unaccustomed show of open wrath, that "if he does not soon come, we shall go for him."<sup>17</sup> Eliza's death, far from putting the whole situation to rest, only inflamed John's feelings anew, complicating his stormy relationship with his father.

That October, in apparent reprisal for his father's failure to attend, John made him sell his Park River ranch, which had now outlived its usefulness as a possible path to rehabilitation. On these transfer documents, John again forced his father to write his real name, "William Avery Rockefeller, widower of Cleveland," so as to keep the money from Margaret.<sup>18</sup> Determined to mete out further punishment, John pushed his father to sell all his western property, move back east, and abandon Margaret Allen altogether, but Bill would not leave Park River. He bought new property nearby and until 1897 continued to spend summers there and winters with Margaret in Freeport.

Six months after Eliza's funeral, Bill had the cheek to arrive in Cleveland, unannounced, his health suddenly and miraculously restored. It was probably this visit that sealed John's decision to sell the ranch in North Dakota. Apparently bent upon patching up relations with John and William, Bill prevailed upon Egbert, an upstate New York farmer, to accompany him on a trip to Manhattan in October 1890. The image of these two hillbillies in the big city measures the extraordinary distance that John and William had traveled from their small-town origins. Maintaining his civility, John gave them a tour of 26 Broadway and took them to Saint Patrick's Cathedral. The sixteen-year-old Junior whimsically narrated these events to a girlfriend in a letter; emerging from the cavernous church, Egbert turned to his hosts and said, "Well, that do beat all I ever see."<sup>19</sup> Even though Egbert was extremely close to Bill, John's children had never met this folksy old character before and were entranced by him. As Junior wrote,

*Uncle is a farmer from Oswego, New York, and has only been to the city once, and then on business, so that he knew nothing about the life that is led here and he has been most interested to ride in the park and see all the fine carriages and horses besides the many other sights of interest to one only accustomed to country life. He is such a dear, simple minded old man and is so appreciative of anything done for him that it is a great pleasure to make his visit as enjoyable as possible. Grandfather said to me the other day when we were driving together, "Uncle Bert is so happily disappointed in your family and Uncle Will's." I said why how do you mean. "Well," said he, "he told me that he supposed you would be stiff and high minded and hardly pay any attention to an old country man like him, and he is so delighted to find you all so social and entertaining." And, he said, "he does enjoy everything he sees here so much, why he talks to me until nearly eleven o'clock every night, telling me all about it."*<sup>20</sup>

John suspected that this would be his aging father's last East Coast visit, though Bill continued to show up in Cleveland, often escorted by Uncle Egbert. In the acrimonious style that marked all their business dealings, John continued to wrangle with his father about money matters. In 1881, he had advanced him money to enlarge Eliza's Cheshire Street house, the one John had built as an adolescent under Bill's intermittent supervision. Even though Bill had decamped, John had allowed him to retain a share in the house, leaving open the possibility of the penitent's eventual return. For this loan, John had charged—but never collected—6 percent interest. Around 1900, John told his ninety-year-old father that he would cancel his claim to the accumulated interest if Bill signed over his interest in the property to his granddaughters. It was yet another round in his never-ending quest to prevent Margaret Allen from inheriting a penny of Rockefeller money.

Communications between John and his father were routinely routed through Frank or William. As John wrote to Frank in a typical letter in 1898, "I enclose a letter to Father, as I have not his address."<sup>21</sup> Despite the chronic friction between them, Big Bill continued to borrow money from his son and by the end of the century still had a \$64,000 loan outstanding—more than \$1 million in today's money. This dependency grated on Bill, as was evident in September 1902, when John and Frank hosted a daylong party for their father at Forest Hill, gathering up his cronies from Strongsville days. Though he put on his finest duds—a broadcloth coat with silk lapels, a silk hat tilted at a jaunty angle, and a blazing diamond in his shirtfront—Bill was now a bloated 250 pounds. At ninety-two, he was gouty, rheumatic, asthmatic, hard of hearing, nearly blind, cantankerous, and unsteady on his feet. For all that, when they held a turkey shoot in his honor, Bill won hands down. The guests spent much time reminiscing and were doubled over with laughter as Bill told his salty tales. Later, when asked where he lived, he grew extremely coy; pressed, he raised his hand, saying, "No, no, boys; that's one thing I shall not tell."<sup>22</sup> He did drop two hints, however: that he lived somewhere out west and that he shot "shirt-tail swans" on a nearby lake—trivial details that sparked one of the great wild-goose chases in journalism history.

What makes the Forest Hill reunion so fascinating is that outsiders had an unusual chance to observe relations between John and his father. From his constant trips to Kansas, it was clear that Bill felt warmly toward Frank, but the tension between Bill and John was palpable. The old man seemed to delight in embarrassing his son before their guests. At one point, Bill was sitting on the lawn, holding court, when John approached quietly. "Here comes Johnnie," Bill taunted him. "I suppose he is a good Baptist, but look out how you trade with him."<sup>23</sup> Later, he told John that if he didn't pay him fifty cents for every squirrel on the place, he would "shoot every damn one of them."<sup>24</sup> Everybody but John seemed to enjoy the humor. To John's extreme discomfort, Bill launched into a long string of bawdy stories, narrated with all the brio he could muster. In a revealing moment, John tried to slip away so that he would not have to hear his father's remarks, but Bill grabbed his son and made him stand and listen to these ribald jokes. At the end of the day, while John tried to recover from this public humiliation, Frank and Bill took a long, sentimental drive through the Cleveland streets.

The tense relations between John and his father were paralleled by increasing rancor between John and his malcontent brother Frank, who was always maddened by his success. As a vast discrepancy in wealth arose between him and his two brothers, Frank tried to redress the imbalance by gambling, only to stumble into fresh fiascos and exacerbate his reliance on them. Whenever he attempted to emulate John's business flair, he acted in a dangerously capricious fashion, and his subsequent failures further infuriated him against his brother. As he waded into commercial blunders and rash speculations, his dark side acquired a pathological intensity, with one observer depicting Frank as "hot-tempered and vindictive. . . . Sometimes I have thought that he was insane. He was a very violent man. Perhaps brooding over some wrong, real or imaginary, had upset his mind."<sup>25</sup>

Aware of the problems his legendary stature caused Frank, John felt acutely the difference in their fortunes and wanted to find a place in business for Frank, but he couldn't countenance his methods and was offended by his public tirades against him. In the late 1870s, Frank was a partner in the rival

Cleveland refinery Pioneer Oil Works, and John classified his brother among the blackmailers who tried to unload their antiquated refineries on him at extortionate prices. “He and others were up to such schemes all the time till they got their property sold out at the price they wanted—schemes of blackmail!”<sup>26</sup> John labored tirelessly to win control of Pioneer Oil Works and, instead of snuffing it out, favored its discreet absorption by Standard Oil. Using William as an intermediary—there were times when John and Frank did not speak—he offered Frank lucrative deals in which the trust would refine Pioneer’s oil. While Frank thought he was negotiating only with William, John secretly monitored their exchanges and dictated letters sent under William’s signature. The genial William was also the front man for large loans that Frank might have spurned if offered directly by John. In the end, Frank negotiated an advantageous deal in which Standard Oil would market Pioneer’s surplus oil whenever Pioneer lacked enough customers—a one-sided deal John would have approved only out of fraternal sentiment. Instead of showing gratitude, Frank rewarded John by trying to steal away Standard Oil customers and raiding territories it controlled.

An incorrigible ingrate, Frank wanted to have it both ways: to be heavily indebted to his brothers yet operate free of their control. He asked John to become his banker then expected leniency from him. He took several gigantic loans from John and William—some as large as \$80,000—with all too predictable results. When Frank piled up staggering losses in private oil speculations, Colonel Payne reported to John in 1882: “*Confidentially*— it is reported that Frank has lost very largely in his operations at Chicago—it is put as high as \$100,000.”<sup>27</sup> When Frank’s health broke under the strain, John tried, to no avail, to wean him away from gambling.

Trying to equalize his status with his brothers, Frank lived on a lavish scale that far outstripped his income. He later bought a beautiful country home in Wickliffe, Ohio, seven miles from Forest Hill, complete with 160 acres of barns, paddocks, and a racetrack. He trained fine racehorses, raised Shetland ponies and prize cattle, and stocked a hunting preserve with deer, bear, foxes, and squirrels. Nothing pleased Frank more than to dust off his Civil War uniform on patriotic holidays and strut around his property with fellow veterans, perhaps to remind John and William that they hadn’t flocked to the Union banner.

On his travels, Big Bill had spotted a large tract of cheap land in Belvidere, Kansas, west of Wichita, which Frank turned into an 8,000-acre ranch. When he first bought the property, it was remote from railroads, and he could graze his buffalo herd, pedigreed horses, and shorthorn cattle on vast, unfenced plains. Not surprisingly, John and William carried the ranch mortgage and financed additional land purchases. Then the Atchison, Topeka and Santa Fe Railroad inaugurated service to the area, fresh settlers swarmed in, and the free range shrank for cattlemen. Where Frank’s livestock had been able to forage for ten miles to the east and twenty-eight miles to the north, now they could go just two miles to the east and four miles to the north. This ruined the ranch for breeding beef, and Frank tried futilely to sell the depreciated property.

Striking a familiar whining note, Frank told John, “I can’t understand why this vein of ill luck & misfortune holds to me in every piece of property I have.”<sup>28</sup> At such moments, he dropped the bravado and showed almost abject gratitude to his brothers, now signing a written agreement to end his speculations. As he reassured John, “I take this opportunity of thanking you & Will for your great kindness to me, & agree not to enter any new business of *any kind*, without first conferring with you.”<sup>29</sup> Instead of chiding him, John steadily advanced more money in 1884, retired his debts, provided income for his family, and rallied his bruised spirits, saying, “Keep a stiff upper lip, clean up as you go, and the skies will brighten by and bye.”<sup>30</sup>

That year, Frank rewarded John’s generosity by again testifying against Standard Oil in congressional testimony, charging it with accepting huge railroad rebates. With Frank, John tried to show a preacher’s patience, yet he was caught on the horns of a dilemma: If he showed generosity toward Frank, it deepened his brother’s dependence and bred anger; if he didn’t give him money, Frank threw a tantrum. His brother’s two-faced behavior rankled, causing John to exclaim in later life: “My poor brother! He has had his day. I pulled him up four times out of bankruptcy.”<sup>31</sup>

Oppressed by debts from oil speculation and ranching, Frank could no longer contribute capital to Pioneer Oil Works, and the firm shut down. His partner, J. W. Fawcett, pleaded with John D. to buy the firm, but Standard already had excess Cleveland refining capacity. After a brief fling as a stockbroker, in 1886 Frank was appointed a second vice president of Standard Oil of Ohio, a post created for him by his brother. For all his sermonizing about John, Frank gladly took advantage of nepotism and, once on the trust’s payroll, had no scruples about enforcing policies he had recently excoriated. When competition loomed up in Michigan, he reveled in stamping it out and proudly wired John that “our idea . . . to wipe out all M[ichigan] companies completed—doing the business in the name of the Standard Oil Company of Ohio.”<sup>32</sup> He bullied Cleveland refiners who requested higher refining allotments from Standard Oil—much as he had tried to do for Pioneer Oil Works. And he wasn’t above milking his position for personal gain. After visiting the new oil boomtown of Lima in 1886, he wrote to John, “Lima, Ohio, is a very pretty town of 12,000 inhabitants and it seems very natural that the oil interest there and the building of a refinery would create quite a boom in real-estate.”<sup>33</sup> He had the effrontery to ask John for money for his real-estate speculation in the city—which would only drive up the price of land Standard Oil was trying to buy.

Frank Rockefeller never fared well in the business world and spread dissension in the Standard ranks. He was jealous of the power wielded by the office head, Colonel Thompson, the former Confederate colonel. (That Frank had been wounded on the Union side couldn’t have helped.) For one tumultuous year, Frank and Thompson waged their own civil war, Frank steaming at duties Thompson assigned to him. In confidential letters to John D., Frank tried to smear Thompson as a power-mad executive, feathering his nest at the company’s expense. As Standard Oil angled for a natural-gas charter in Cleveland, Frank wrote privately that Thompson “is intending to so pull wires and spend money . . . in such a way as if possible, to wield such an influence as would result in his own personal aggrandizement politically.”<sup>34</sup> Thompson, a tough, wily customer, could have outmaneuvered Frank, but he wisely sensed the perils of beating the president’s brother and withdrew from the field of battle. Instead, he moved to New York and chaired the domestic-trade committee at 26 Broadway, leaving Frank outwardly in charge in Cleveland.

In February 1887, the trust further downgraded Cleveland in the Standard Oil hierarchy, reducing it to a shipping and manufacturing center, with actual business decisions taken in New York. In other words, high-level orders would now emanate from Thompson’s committee. As Frank wrote John from Cleveland, “When I returned to the city Monday morning I found the people throughout the entire building in a fearfully demoralized state of mind, and was besieged more or less for several days by different ones—all anxious to know what their fate was to be—the general impression prevailing that a majority of them would lose their situations, business going to New York.”<sup>35</sup>

Irritated by Frank’s griping, John was soon coldly writing “Dear Sir” letters to him and signing them, “John D. Rockefeller, President.” Gradually, Frank was shunted aside by Feargus Squire, nominally secretary of Standard of Ohio and lower than Frank on the organization chart, but the real boss of the office. It seems that Frank alienated virtually everyone in the building and was increasingly ostracized. An official history of Standard of Ohio describes the denouement: “The vice-president’s interest in what was going on, seldom noticeable, diminished as time went by, and there were those who came to regard him as a millstone around the neck of a more talented man. Many thought he was being retained because his name was Rockefeller—an opinion which a hundred contrary pronouncements from 26 Broadway would not have altered.”<sup>36</sup>

## A Matter of Trust

For twenty-five years after Drake's discovery, no major oil field was discovered in America beyond the Pennsylvania borders, so that it was never clear whether Rockefeller's empire rested on terra firma or quicksand. When somebody told John D. Archbold in 1885 that traces of oil had been found in what later became Oklahoma, he reacted with incredulity. "Are you crazy, man?" he scoffed. "Why, I'll *drink* every gallon of oil produced west of the Mississippi!"<sup>1</sup> Though small amounts of crude were being pumped in California and Kentucky, one expert solemnly assured Archbold that the chances of finding another bonanza on the scale of the Bradford field were one in a hundred; in alarm, Archbold liquidated some of his Standard Oil shares. Writing to Rockefeller that September, he mused gloomily that "we have opened nothing of importance in the way of production this summer, and next winter must see a great reduction in the old Bradford and Allegheny fields, from which the bulk of the production is yet obtained."<sup>2</sup> The American oil business seemed headed toward premature extinction.

Rockefeller and his associates had long been haunted by two antithetical nightmares: Either the oil would dry up, starving their network of pipelines and refineries, or they would drown in a sea of cheap oil that would drag prices below their overhead costs. At one panicky executive-committee meeting in the early 1880s, it was even suggested that Standard Oil should exit the business and enter something more stable. After listening quietly to such defeatist talk, Rockefeller stood up, pointed skyward, and intoned, "The Lord will provide."<sup>3</sup> Rockefeller tended to see a heavenly design in all things and was convinced that the Almighty had buried the oil in the earth for a purpose.

In retrospect, it seems peculiar that Standard Oil—omnipotent in refining, transportation, and distribution—owned just four producing properties in the early 1880s. Thousands of Standard Oil employees had never seen a well. Why had Rockefeller not taken over the oil fields and completed his mastery of the industry? One must recall that in its formative years, the business suffered more gluts than shortages, giving Rockefeller the option of sitting back and watching producers slash prices in chaotic competition. He had long profited from the juxtaposition of cooperation in refining and competition in production. Political tact also dictated that he tread warily. As late as 1884, Archbold vigorously opposed any move into production as overly provocative: "I think if the name of the Standard Oil Co. were to go forth coupled with the movement, it would make new food for demagogues, politicians, papers, and howlers of all descriptions."<sup>4</sup>

Why, then, did a radical policy shift occur within a year or two? Partly, this derived from the trust's entry into natural gas, which put it, willy-nilly, in the drilling business, but the more compelling reason was that Standard Oil had built up a huge global machinery with a ravenous thirst for crude oil. As the Pennsylvania fields were depleted, Rockefeller feared that he might have to turn to Russian crude, and it seemed certain that the Russians would exploit their control of the oil fields to weaken or even eradicate Standard Oil. Already by 1884, an anxious Rockefeller was badgering associates to create a crude-oil reserve beyond their immediate needs, and he invested in some West Virginia producing properties. As he warned a skeptical colleague, "We must keep in sight always a large volume of the raw material, and better that this stock be somewhat excessive than run the risk of Russian competition shutting us out."<sup>5</sup>

Then came a turning point almost as momentous as Drake's discovery. In May 1885, a group of small operators, searching for natural gas in northwest Ohio, tapped a pocket of oil instead. This threw the industry into a wild uproar, providing incontestable proof that substantial deposits existed in the United States outside of Pennsylvania. By year's end, more than 250 derricks had sprouted around the town of Lima, spilling across the border into Indiana. Yet the cheering was restrained, for the chemical content of Lima crude had intractable quality problems that threatened to destroy its value. For one thing, it contained less kerosene than Pennsylvania petroleum and that kerosene spread a film over lamps. Even more troublesome, its high sulfur content corroded machinery and gave off a deadly smell. (Pennsylvania crude had a paraffin base.) As one newspaper put it, "The chief fault found with Ohio stuff is the fact that it smells like a stack of polecats and is only worth forty cents a barrel."<sup>6</sup> For a household item, this stench was a fatal drawback, and the standard practice of cleansing crude with sulfuric acid was not enough to disinfect it.

It was, arguably, Rockefeller's supreme inspiration that he believed in the Ohio-Indiana fields—one of those flashes of vatic power that made him a business legend. As he said, "It seemed to us impossible that this great product had come to the surface to be wasted and thrown away; so we went on experimenting with every process to utilize it."<sup>7</sup> To solve the problem, in July 1886 Rockefeller imported a distinguished, German-born chemist named Herman Frasch and gave him simple marching orders: Banish the odor from Lima crude and turn it into a marketable commodity. While Frasch burrowed away at this problem, the Standard Oil board faced an excruciating dilemma: Should they assume Frasch would succeed and buy up huge leases along the Ohio-Indiana border; or should they wait until Frasch had finished and risk losing the choicest properties?

Despite his prudent style, Rockefeller could exhibit visionary daring and undertake colossal gambles. He was now prepared to wager an enormous amount on Lima oil, a decision that tested his belief in management by consensus, for a conservative board clique headed by Charles Pratt obstinately resisted him. Rockefeller had always derided Pratt as weak-kneed and fainthearted, a "small man" who contributed little beyond the marketing area.<sup>8</sup> Yet far from imposing his will, Rockefeller tolerated prolonged debate about Lima crude, producing "a continual wrangle in the Board of the Standard Oil Company, day by day, month by month, year after year."<sup>9</sup>

A thin man with a Vandyke, active in his Baptist church, Pratt shared Rockefeller's puritanical style. "Waste neither time nor money" was his favorite motto.<sup>10</sup> A donor to many causes, Pratt was the first president and principal donor of the Adelpia Academy in Brooklyn and later bequeathed several million dollars to found the Pratt Institute, which offered classes in manual trades, the arts, and domestic economy. Despite their similarities, Pratt was a timid executive who lacked Rockefeller's audacity and often felt slighted by him. He now turned the Lima debate into a referendum on his own business acumen. At every meeting, when Rockefeller proposed purchasing Ohio leases, Pratt and his faction objected. As Rockefeller said in mockery, they "held up their hands in holy horror."<sup>11</sup> Finally, to break the deadlock, Rockefeller took an incalculable gamble. At one board meeting, after Rockefeller made his standard pitch for a Lima investment, Pratt lost his temper, threw back his head in agitation, and shouted "No!" Whereupon Rockefeller replied

coolly, “I will build this improvement out of my own funds and underwrite it for two years.” He astonished his colleagues by pledging \$3 million—about \$47 million in 1996 dollars. “At the end of that time if it is a success the company can reimburse me. If it is a failure, I will take the loss.”<sup>12</sup> Whether impressed by Rockefeller’s unflinching resolve or realizing that he had lost, Pratt capitulated. “If that’s the way you feel about it, we’ll go it together,” he replied. “I guess I can take the risk if you can.”<sup>13</sup>

Standard Oil spent millions of dollars to buy oil properties, build tank cars, and construct pipelines in Lima. Daniel O’Day had never seen an oil field that he didn’t want to crosshatch with pipes, and when the trust started the Buckeye Pipe Lines Company to gather Lima crude in March 1886, he informed producers with more force than subtlety that they had to give Buckeye all their crude. Any driller who struck oil was accosted on the spot by one of O’Day’s determined agents. As he told Rockefeller, “I believe it is for the best interest of our company that as soon as we learn of any new development either oil or gas that we have a man there at once and have him stay there ready to take hold of anything that may turn up.”<sup>14</sup> An irresistible force, O’Day soon cornered 85 percent of the Lima oil. Even though no market yet existed for the “skunk oil,” the trust bought every single barrel offered by producers and by 1888 had over forty million barrels in storage tanks. By that point, the foul-smelling fluid sold for fifteen cents per barrel.

In taking his gamble, Rockefeller hadn’t *entirely* trusted to the Lord and the Standard Oil chemists and was casting about for a new application for the malodorous oil. He found the answer in fuel oil. The trust sent out teams of salesmen and technicians to persuade railroads to burn oil instead of coal in their locomotives and to suggest to hotels, factories, and warehouses that they switch from coal furnaces to oil burners. Although this effort flourished, the resulting business still didn’t equal the scale of the kerosene industry and only marginally diminished the fierce pressure weighing on Herman Frasch in his laboratory.

Nicknamed the Wild Dutchman, the vainglorious Frasch conformed to the stereotype of the eccentric scientist. A short man of explosive temper, he had immigrated to the United States after the Civil War. In the mid-1870s, Rockefeller brought him to Cleveland, where he did splendid work with paraffin, producing a new wax for British candle makers and a new ingredient for Cleveland’s chewing-gum magnate, William J. White. Afterward, Frasch set up shop in Canada and patented a process for eliminating sulfur from sour Ontario oils. Since the Ontario fields lay across Lake Erie from northwest Ohio, Rockefeller must have assumed a high likelihood of success when he hired Frasch to work on a kindred problem. By February 1887, Frasch had achieved partial success with Lima crude, introducing copper oxides to remove the sulfur. Then came the big breakthrough of October 13, 1888, when Feargus Squire wired Rockefeller with the historic news he had eagerly awaited for two years: “We are pleased to advise you that by experimenting with the Frasch process we have succeeded in producing a merchantable oil.”<sup>15</sup>

Frasch’s feat did more than vindicate Rockefeller’s reputation as an uncanny prophet of industry trends. Had Frasch not figured out how to use Lima crude, a critical shortage of American oil would have arisen between the depletion of western Pennsylvania crude and the Texas and Kansas booms of the early 1900s. For fifteen years, Frasch’s patents furnished dazzling profits for Rockefeller and Standard Oil and boosted the status of research scientists throughout the industry. The original oilmen were self-made roughnecks, biased against science and prone to operate by intuition, whereas Rockefeller brought a rational spirit to the business, and this counted among his greatest contributions. As the philosopher Alfred North Whitehead said, “The greatest invention of the nineteenth century was the invention of the method of invention.”<sup>16</sup> When Frasch cracked the riddle of Lima crude, he was probably the only trained petroleum chemist in the United States. By the time Rockefeller retired, he had a test laboratory in every refinery and even one on the top floor of 26 Broadway. This was yet another way in which he converted Standard Oil into a prototype of the modern industrial organization, its progress assured by the steady application of science.

Once Rockefeller had an insight, it often gripped him with the irresistible force of an epiphany, and he now decided that Standard Oil must guarantee its crude-oil supply. After Frasch certified the worth of Lima crude, the trust moved into oil production with all the formidable resources within its reach. In 1889, a production committee was formed under the aegis of John D. Archbold, and it spent money at such a torrid pace that within two years it had disbursed \$22 million—a figure that strained even Standard Oil’s budget, prompting more anguished howls from Charles Pratt. Rockefeller’s faith was vindicated, however, as the Ohio-Indiana field overtook the waning Pennsylvania industry and became the country’s crude-oil leader in the 1890s.

Rejuvenated by Lima, Rockefeller embarked on a buying binge such as the industry had never seen. Swallowing up Union Oil and three other big producing firms in 1890, he took over three hundred thousand acres of Pennsylvania and West Virginia—huge chunks of acreage that encompassed whole counties. The most feared man in the Oil Regions now became their dominant landlord and producer. “Hitherto the attention of the big Octopus has been largely directed toward crushing out all opposition in the refining of oil,” noted one agitated newspaper. “This latest deal shows that it has started to crush out the producers of the crude oil and obtain control of their property.”<sup>17</sup> By 1891, Rockefeller had gained control of a majority of the Lima fields and a quarter of American oil production. (The trust’s share of American crude production peaked at 33 percent in 1898.) By narrowing the range of competition in oil production, the move hastened the day of political reckoning for Standard Oil.

In future years, the discovery of new fields both at home and abroad provided openings for upstart competitors, but the trust’s swift, complete control of the Lima field gave it unchallenged control of American oil in the 1890s. The only major competitor spawned by the new territory was the Sun Oil Company, started by J. N. Pew in 1886. In spring 1891, Archbold visited Lima, cast a proprietary eye over oil fields stretching more than one hundred miles, and gloated in a letter to Rockefeller, “We undoubtedly have, as the case stands, well in reserve the greater part of the defined territory, and we will certainly be able to produce oil in the Ohio field more cheaply than anybody else, owning, as we do, great bodies of territories which we can drill judiciously.”<sup>18</sup> Now that Rockefeller had scored such a gratifying triumph in production, he instructed Archbold to grab anything that could still turn a profit with crude at fifty cents a barrel. “If so would buy all we can get,” he wired.<sup>19</sup> In this rush into exploration and production, Rockefeller created the model for the vertically integrated oil giants that would straddle the globe in the twentieth century.

The discovery of oil in Ohio radically redrew the map of the Standard universe, for it was senseless to ship crude oil to eastern refineries only to ship kerosene back to markets in the Midwest and Far West. In 1886, even before Frasch had completed his work, O’Day scouted northwest Ohio for an appropriate refinery site and chose the charming town of Lima itself, which was served by four railroads. The emergence of the giant Lima refinery accelerated the demise of Cleveland and Pittsburgh as refining centers, and by 1896 Standard Oil phased out its largest Cleveland refinery.

The Lima refinery was a mere preamble to the main event in the Midwest. In June 1889, the trust organized Standard Oil of Indiana, which would build America's premier oil refinery at Whiting, Indiana, seventeen miles from downtown Chicago. During his 1891 tour, Archbold, trembling at the magnitude of this undertaking, told Rockefeller that the plant's ability to process 36,000 barrels of crude oil daily struck him as "almost impossible to comprehend."<sup>20</sup> The refinery remained a wonder of world oil for many years. At Whiting, Dr. William M. Burton produced his revolutionary discovery of how to "crack" petroleum, vastly increasing its yield of gasoline—an essential precondition of the auto age.

It took time for Standard Oil to wipe away the stigma of Lima crude, for just enough sulfur remained in the kerosene to clog chimneys and lamps in damp weather. In a confidential letter to Rockefeller, Archbold confessed that for the first time their competitors could justly claim a superior product. The trust was now a victim of its own dirty tricks. After the Ohio oil was discovered but before Rockefeller had won over Pratt, Standard had engineered a propaganda campaign to convince consumers that Lima oil was inferior to Pennsylvania oil. This strategy had now boomeranged on them, Archbold told Rockefeller, "so that it is necessary, until this prejudice is gotten out of the way, that the greatest possible care must be taken to have every shipment from both Lima and Whiting absolutely beyond the possibility of legitimate complaint."<sup>21</sup> The original slander was refuted with difficulty.

As Standard Oil secured complete control of the oil industry, many ordinary citizens were frightened by its gargantuan size, rapacious methods, and inexorable growth, and it came to symbolize all the disquieting forces reshaping America. It was the "parent of the great monopolies which at present masquerade under the new-found name of 'Trusts,'" said one newspaper, and it served as shorthand for the new agglomerations of economic power. A business system based on individual enterprise was creating combinations of monstrous size that seemed to threaten that individualism. And modern industry not only menaced small-scale commerce but appeared to constitute a sinister despotism that endangered democracy itself as giant corporations overshadowed government as the most dynamic force in American society.

As the leading figure in this consolidation, Rockefeller was the emblematic figure of the Gilded Age and hence a lightning rod for criticism. He closely followed political developments and was keenly alert to any potential threats to his business interests. In his personal campaign contributions, though, he won a well-earned reputation as a stingy giver, and some politicians even felt miffed at his paltry gifts. The clandestine payoffs made by Standard Oil were a different matter, and Rockefeller never stinted in making payments to get the job done.

At the turn of the century, reporters spilled a great deal of ink over charges that Standard Oil had bought Henry B. Payne's election to the U.S. Senate in 1884. This putative case of political corruption received more attention from critics than any other, although little evidence was ever adduced to substantiate it. With his white hair and wire-rimmed glasses, Henry B. Payne—father of Standard Oil's treasurer, Oliver Payne—was an affable man with a distinguished air. A Cleveland lawyer and perpetual candidate for public office, he lobbied for mandatory education in Cleveland, worked ardently for the Union cause, and helped to found the Case School of Applied Sciences, while also serving as part owner of two railroads. Unlike his wealthy Euclid Avenue neighbors, Payne was a Democrat who had campaigned for Stephen Douglas in his 1860 presidential bid against Abraham Lincoln. Ironically, in light of later allegations, when he first ran for Congress, Standard Oil supported his opponent and helped to defeat him. Ambitious for his father, the cold, haughty Oliver Payne acted as his perennial campaign manager, starting with his congressional victory in 1874. Two years later, Oliver tried unsuccessfully to capture the Democratic presidential nomination for his father—a presumptuous bid for an elderly freshman congressman. This lost cause earned Oliver a somewhat Machiavellian reputation, and one newspaper observed acidly: "He's got a purse that is inexhaustible, a silent tongue, and a capacity for the organization and manipulation of men."<sup>22</sup>

In the late 1870s, Henry Payne lost his congressional seat. Approaching seventy, he might have retired gracefully from politics, but he could not seem to shed his daydreams of higher office. When he sought the Democratic presidential nomination in 1880, his opponents cruelly baited him about his age, and one stooped to calling him "an attenuated, dried-up old fossil."<sup>23</sup> To retire these charges, Payne gave a nimble spring to his step, a youthful vigor to his gestures. Possibly more harmful was Payne's association with Standard Oil, which blemished his reputation among many Democrats. Payne received only eighty-one votes on the first ballot as General Winfield Hancock walked off with the nomination.

At the time, U.S. senators were elected by state legislatures, creating an open season for graft and influence peddling by business interests. When the Ohio legislature elected Henry B. Payne to the Senate in 1884—the legislature would go down in history as the infamous "Coal-oil Legislature" for its obeisance to Standard Oil—it was widely rumored that Oliver had sat behind a desk in a Columbus hotel room and doled out bills to legislators, the final tab reaching \$100,000. These bribery allegations, though never proved, shadowed Senator Payne and provoked a firestorm of abuse against Standard Oil. Whether Oliver Payne bought the election is uncertain, but it seems far-fetched that Rockefeller or Standard Oil conspired with him. Henry Payne was a staunch Democrat, and Standard Oil was a Republican stronghold. Rockefeller likely spoke the literal truth when he said, "I was opposed to the election of Senator Payne, as a Republican and never anything else but a Republican. And not one farthing of the money of the Standard Oil Company went to his election; nor were the Standard Oil Company favorable to his election, as a company."<sup>24</sup>

Aside from his father, Oliver Payne gave Standard Oil a second important link to the Democratic Party through his brother-in-law, William C. Whitney. Even though Oliver had been two years older and infinitely richer than Whitney at the time, the two were fast friends at Yale. To an extent that some observers found unhealthy, Oliver doted on his lovely, gregarious sister Flora; when he arranged for her to meet Whitney in 1868, he already "knew that if they met, they would fall in love with each other," he later admitted.<sup>25</sup> When they married a year later, he became their self-appointed benefactor, buying them a five-story Park Avenue brownstone. This was a mere curtain-raiser to his next gift, a showy \$700,000 mansion, glistening with gorgeous paintings and Gobelin tapestries, at the corner of Fifth Avenue and Fifty-seventh Street, across from Cornelius Vanderbilt's residence. One historian said that Oliver insouciantly "presented it to the Whitneys as one might present a poodle," and with his sublime self-assurance, this lifelong bachelor moved into one of its sumptuous second-floor apartments.<sup>26</sup>

William C. Whitney was a dashing man with a matchless talent for attracting monied patrons. Though he stayed only one year at Harvard Law School, he became a rich Wall Street lawyer, representing Commodore Vanderbilt and other railroad clients. Active in the Democratic Party, he won the patronage of Samuel J. Tilden, who, as governor, had him named New York City's corporation counsel. In 1884, Whitney shrewdly supported Grover Cleveland, the mayor of Buffalo, for president and brokered a truce between the reform-minded Cleveland and Tammany Hall. When Whitney emerged

as an influential insider in Cleveland’s presidential campaign, some critics thought him a Standard Oil tool. In reality, Rockefeller voted for James G. Blaine, a paladin of business interests, and predicted the election would be “a great calamity” if Cleveland won.<sup>27</sup> In an unprecedented step, Rockefeller allowed his name to be listed as vice president for a Republican fund-raising effort in the city of Cleveland.

To further Grover Cleveland’s candidacy, Whitney persuaded Henry B. Payne that the growing furor over Standard Oil made it an inauspicious time for him to vie for the Democratic nomination. Instead, Henry and Oliver Payne poured \$170,000 into Cleveland’s war chest. After Cleveland’s victory, it looked as if Whitney would be named interior secretary. Then the press tagged him with the sobriquet of “Coal Oil Billy” and raised the specter that Standard Oil would loot public lands. As a consolation prize, Whitney settled for an appointment as secretary of the navy. For all the baseless speculation about his links to Standard Oil, Whitney was seldom asked to perform favors for the trust and spent most of his time constructing a new steel navy. Around the time that William and Flora Whitney moved to Washington, Oliver Payne, citing the “need for a rest,” resigned from Standard Oil.<sup>28</sup>

Despite its many shareholders, the Standard Oil trust was always controlled by a small clique of powerful families. “I think it is true that the Pratt family, the Payne-Whitney family (which were one, as all the stock came from Colonel Payne), the Harkness-Flagler family (which came into the Company together) and the Rockefeller family controlled a majority of the stock during all the history of the Company up to the present time,” Rockefeller commented in 1910.<sup>29</sup> Because the Harkness and Payne families were sociable and intermarried with the Vanderbilts and Whitneys, they spread a great deal of Standard Oil bounty through America’s social aristocracy.

While Standard Oil gadflies pounced on the political bonds between the Paynes and William Whitney, they missed a more flagrant case of political corruption: that of Johnson Newlon Camden, who served as a West Virginia senator from 1881 to 1887 but never severed his ties to Standard Oil. Approaching his 1881 election to the U.S. Senate as a straight business proposition, he favored a liberal distribution of cash to the West Virginia legislature to secure results. As he plaintively told Flagler that year, “Politics is dearer than it used to be—and my understood connection with the Standard Oil Co. don’t *tend to cheapen it*—as we are all supposed to have bushels.” This was prelude to an urgent request for “\$10,000 in some turn—stocks or oil—Please keep an eye out and let me know.”<sup>30</sup> Apparently, Standard Oil obliged, for in the next letter, Camden reported victory to Flagler. “I also appreciate sincerely the substantial kindness of the Ex[ecutive] Com[mittee]—and used it without hesitation as I needed it temporarily.”<sup>31</sup>

Even after entering the Senate, Camden continued to correspond with Rockefeller and Flagler as if he was still an active Standard Oil executive, and he discussed the trust’s negotiations with the B&O Railroad on U.S. Senate stationery. He organized a railroad with Oliver Payne and urged Rockefeller, Flagler, and Harkness to join them. Throughout his term, Camden stood sentinel over Standard Oil interests, and when two pipeline bills inimical to the trust appeared in the Maryland legislature in 1882, he acted promptly, informing Flagler with satisfaction, “My dear Mr. Flagler, I have arranged to kill the two bills in Md. legislature at comparatively small expense.”<sup>32</sup>

With Grover Cleveland’s election in 1884, many businessmen braced for reform in Washington, but he turned out to be quite moderate. Nonetheless, the public revulsion against monopolies steadily gathered force, producing an Anti-Monopoly Party that condemned railroad pools and rate discrimination. Although grain elevators, meatpackers, and harvesting-machine companies were all feeding off railroad rebates, Standard Oil was thrust into the foreground of antimonopoly indictments. As the *World* wrote in a scorching attack against the trust in 1887, “When the 19th century shall have passed into history, the impartial eyes of the reviewers will be amazed to find that the U.S., supposed to be conservative of human liberty and human right, tolerated the presence of the most gigantic, the most cruel, impudent, pitiless and grasping monopoly that ever fastened itself upon a country.”<sup>33</sup>

Nonetheless, it took time to establish the legal rationale for government regulation of private business. In 1876, in *Munn v. Illinois*, the Supreme Court had famously declared, “Property does become clothed with a public interest when used in a manner to make it of public consequence, and affect the community at large.”<sup>34</sup> By this point, Standard Oil wasn’t overly worried about an interstate-commerce bill against railroad discrimination. The trust ran its own pipeline system to the seaboard and was confident that if railroad regulation came it could still be bypassed. When Congress finally passed the Interstate Commerce Act in 1887, outlawing railroad pools and rebates and setting up the first regulatory commission, Senators Payne and Camden dutifully voted against the bill, but its defeat had not been assigned a high priority by the trust.

In public, Standard Oil pretended to welcome the equal treatment mandated by the new act and vowed to accept no more rebates. As Rockefeller and Archbold later claimed in 1907 when their subsequent behavior was questioned, “Since the enactment of the interstate commerce law in 1887, the Standard Oil Co. has most carefully observed its provisions and in no case has wilfully violated the law.”<sup>35</sup> Rockefeller tended to portray himself as a hard-driving executive who went as far as the law allowed but not an inch further. Allan Nevins concurred in this view, noting that “following the Interstate Commerce Act of 1887, the Standard, as careful observers generally agree, came close to a general obedience of the new law, and asked no outright rebates.”<sup>36</sup>

But there is reason to question this assertion. Right before the act’s passage, Standard had to grapple with state challenges to railroad rebates, and the ubiquitous Colonel Thompson, closeted with railway officials, found ways to skirt the new regulations. In the spring of 1886, Thompson conferred with officials of the Lake Shore Railroad after the Ohio Supreme Court had outlawed freight discriminations. They came up with a way to create the illusion that all shippers paid the identical posted rates while Standard Oil was compensated secretly through an accounting gimmick. As Thompson explained this subterfuge to Rockefeller:

*Our arrangement is a very simple one: We are paying the open tariff rates to Michigan and all other points and this same is required of all other shippers. I have a distinct understanding with the proper persons that we are not required or expected to pay more than formerly and in order that we may not be out any money . . . we deduct from Chicago payments an equivalent amounting to what would have been a proper payment on all the other points, each month. You will readily see the object of this and you will observe in the situation we are in that no better or fairer arrangement could possibly have been made or one more satisfactory to us.*<sup>37</sup>

When the Missouri railroad commissioner ordered uniform freight rates in 1888, Thompson advised Rockefeller, “We have reason to think that this

order will be withdrawn. At any rate, the roads will pay no attention to it.”<sup>38</sup>

Such oral arrangements may have helped to pacify Standard Oil in the wake of the Interstate Commerce Act. Also, no governmental body could strip it of its giant tank-car fleet and the lucrative royalties they brought in; Standard Oil wasn’t compelled to supply tank cars to competitors. There were even unexpected dividends from the equality prescribed by the act. The new Interstate Commerce Commission said the railroads had to charge the same rate for oil in barrels (used by independents) and in tank cars (used by Standard Oil); as a result, the roads, for the first time, could charge for the weight of the barrels, penalizing independent shippers. For a brief period, the Interstate Commerce Act might have chilled collaboration between trusts and railroads, but they gradually figured out ways to evade the law and slip back into well-worn arrangements. The fight against the railroad rebate remained a hardy perennial of reform politics for a generation. In 1907, Standard Oil was briefly slapped with the largest fine in corporate history for a practice it had supposedly given up long before.

By the 1888 election, protests against the trusts—oil, whiskey, sugar, and a score of others—had broken out in so many places that the national platforms of both parties harshly condemned economic concentration. Agrarian reformers in the South and West agitated against the railroads as the midwives of monopoly. Protestant evangelicals deplored the moral crisis that accompanied industrialization and the lopsided distribution of wealth. There was a great upsurge of activity among organized labor as membership in the Knights of Labor soared to 700,000 in 1886. That year, policemen fired on picketers at the McCormick reaper plant in Chicago, provoking the protest at the Haymarket in which a bomb exploded, killing seven people. In 1888, Edward Bellamy published his best-selling utopian novel, *Looking Backward*, with its socialist version of the technocratic society overtaking America. The general public was of two minds and viewed the new entrepreneurs as alternately sinister and heroic. By 1888, Rockefeller began to pop up in fawning magazine features about rich Americans, but he was also singled out as a notorious trust king in Joseph Pulitzer’s *World* and other papers. The press kept up an editorial drumbeat against Standard Oil, demanding vigorous state and federal antitrust action.

Amid this crescendo of criticism, Rockefeller again came under the scrutiny of government investigators. When a New York senate committee investigated Standard Oil in 1888, it learned just how elusive he could be. When a process server came to 26 Broadway, he was told that Mr. Rockefeller was out of town. When he went to 4 West Fifty-fourth Street, he was told that Mr. Rockefeller was at home but could not be seen. At this point, the process server spent the night dozing on Rockefeller’s stoop, lest the mogul attempt an early-morning departure. Ringing the doorbell shortly after daybreak, he was told Mr. Rockefeller had left. Blandly denying that he had fled the process server, Rockefeller later explained that he had been in Ohio and hastened back when notified of the investigation. In fact, Rockefeller had also kept his visit to Cleveland a secret because he feared being served there with a subpoena in a suit by local refiners.

To coach Rockefeller for the New York senate hearings, Standard Oil hired an eminent lawyer, Joseph H. Choate. Choate was slow to appreciate his unusual client, who greeted him cordially then stretched out on a couch with a languid air. When Choate tried to sound him out on several company matters, his tight-lipped client revealed nothing. Choate was frustrated by this seemingly indolent man who kept quizzing *him*. “I wonder how we shall make out with Mr. Rockefeller,” Choate asked Flagler in concern. “He seems so helpless. He is asking questions all the time.” Flagler was amused. “Oh, you will find that he can take care of himself,” he replied. “You needn’t worry about him.”<sup>39</sup>

Several years earlier, during testimony in Albany, Rockefeller had given identical replies to thirty consecutive questions, declining each time to answer on advice of counsel. This time, he knew he had to be, or at least seem, more forthcoming. On a frosty morning in February 1888, clad impeccably in frock coat and top hat, Rockefeller entered a packed hearing room of the superior court in New York City, flanked by Joseph Choate. Since he was fast becoming a mythical figure, his testimony drew extensive press coverage. Still handsome at forty-eight, with a full head of close-cropped hair and a neat reddish brown mustache, he strode in with a purposeful air. On closer inspection, however, one could detect lines around his eyes, and he seemed older and more tired than a few years earlier. He was now carrying a more onerous burden than he knew.

Choate soon discovered that he didn’t need to worry about his client. Like many businessmen of his era, Rockefeller prided himself on his obfuscatory powers and excelled at fuzzy answers. Under oath, he turned into a vague and forgetful fellow, pleasant but slightly muddled, who wandered lost in the stupendous maze of Standard Oil. He was also a terrific showman, a trait he inherited from his father. When sworn in on the stand, he “kissed the Bible vehemently,” according to one reporter, underscoring which party had God on its side.<sup>40</sup>

Rockefeller was interrogated by the committee counsel, Roger A. Pryor, a histrionic lawyer who paced back and forth, his lank black hair flying about his shoulders. He fixed Rockefeller with a penetrating eye and shook an accusatory finger at him. Rockefeller remained placid, accentuating the contrast between them in his favor. As one thunderstruck newspaper wrote of Rockefeller, “He seems the embodiment of sweetness and light. His serenity could not be disturbed. . . . In tones melodious, clear, and deliberate he gave his testimony. . . . At times his manner was mildly reproachful, at others tenderly persuasive, but never did he betray an ill temper or vexation.”<sup>41</sup> As Choate watched in amazement, Rockefeller maintained an unruffled exterior: His client was not exactly the absent-minded rube he had pictured.

Standard Oil’s strategy was to furnish as little information as possible. As Rockefeller’s associate Paul Babcock advised him in emphatic language, “I think this anti-Trust fever is a craze, which we should meet in a very dignified way and *parry every question* with answers which while perfectly truthful are evasive of bottom facts! I would avoid the preparation of any statistics.”<sup>42</sup> True to this advice, Rockefeller economized with the truth, yet so little was known about Standard Oil that the most meager information produced sensational headlines. In his testimony, Rockefeller supplied for the first time the Standard Oil trust agreement that had been drawn up in 1882; named the eight current trustees; revealed that the trust now had seven hundred shareholders; and, most startling of all, listed forty-one companies that belonged to the trust—many of which had never publicly disclosed this association before. To refute the notion that Standard Oil was a monopoly, Rockefeller submitted a list of 111 competing refineries and gave his own stirring account of spirited competition from Russian oil.

The most controversial exchange came when Pryor turned to the darkest episode of Rockefeller’s past: the South Improvement Company. Pryor misspoke and asked if he had ever belonged to the *Southern* Improvement Company; Rockefeller, quick to spot a slip, denied being a member of such a company. With his superb memory, he remembered that an unused charter had been granted for a Southern Improvement Company. Pryor reacted with

disbelief:

“There was such a company?”

“I have heard of such a company,” Rockefeller conceded.

“Were you not in it?”

“I was not.”<sup>43</sup>

Rockefeller’s later gloss on this testimony reveals his craftiness:

*I never undertake to instruct the man who asks me questions. I remember that incident as if it were this morning. . . . I did not stop to correct my questioner. There is the record to stand on. Of course, I knew what I was answering. . . . I did not testify like Mr. Brewster and Mr. Flagler, so hot-tempered that they would fly right into an argument with counsel. I was quiet and self-controlled. It was no part of my duty as a witness to volunteer testimony. While they thought they were leading me into a trap, I let them go into the trap themselves.*<sup>44</sup>

The bane of interrogators, Rockefeller had an eerie gift for catching the subtle drift of a prosecutor’s questions. A distinguished twentieth-century lawyer, Samuel Untermyer, called Rockefeller the ablest mind he had ever encountered on the witness stand, a man with a sixth sense for a legal trap. “He could always read my mind and guess what the next six or seven questions were going to be,” said Untermyer, who cross-examined Rockefeller during litigation in the early 1900s. “I would start with questions intended to lay the foundation for questions far in the future. But I would always see a peculiar light in his eyes which showed that he divined my intention. I have never known a witness who equalled him in this clairvoyant power.”<sup>45</sup> At the February 1888 hearing, Roger Pryor was so impressed by Rockefeller that at the close of questioning, he came to the railing, pumped his hand heartily, and asked if he could visit Standard Oil plants with Rockefeller. As for Joseph Choate, Rockefeller asked casually during the lunch break how he was doing. The chastened lawyer replied, “I could not ask for a better witness.”<sup>46</sup> Choate said later that Rockefeller’s partners “seldom knew what he was thinking but he always knew what we were thinking.”<sup>47</sup>

However well Rockefeller handled his testimony, the committee report threw a lurid light on the workings of Standard Oil, calling it “the most active and possibly the most formidable moneyed power on the continent.”<sup>48</sup> “This is the original trust,” the report stated. “Its success has been the incentive to the formation of all other trusts and combinations. It is the type of a system which has spread like a disease through the commercial system of this country.”<sup>49</sup> The trust floated free of legal restraints, the forty-one constituent companies having “turned their affairs over to an organization having no legal existence, independent of all authority, able to do anything it wanted anywhere, and to this point working in absolute darkness.”<sup>50</sup> While absolving the trust of charges of rapacity, it also dissented from Rockefeller’s portrait of lively competition, calling Standard Oil “almost the sole occupant of the field of oil operations, from which it had driven nearly every competitor.”<sup>51</sup> Standard Oil stood out as the great test case in the growing national debate on antitrust legislation. When the House Committee on Manufactures issued its report on trusts that spring, it dedicated 1,000 of 1,500 pages to the oil trust, five times the space given to the sugar trust and ten times that given to the whiskey trust.

In a sense, John D. Rockefeller simplified life for the authors of antitrust legislation. His career began in the infancy of the industrial boom, when the economy was still raw and unregulated. Since the rules of the game had not yet been encoded into law, Rockefeller and his fellow industrialists had forged them in the heat of combat. With his customary thoroughness, Rockefeller had devised an encyclopedic stock of anticompetitive weapons. Since he had figured out every conceivable way to restrain trade, rig markets, and suppress competition, all reform-minded legislators had to do was study his career to draw up a comprehensive antitrust agenda.

Standard Oil had taught the American public an important but paradoxical lesson: Free markets, if left completely to their own devices, can wind up terribly *unfree*. Competitive capitalism did not exist in a state of nature but had to be defined or restrained by law. Unfettered markets tended frequently toward monopoly or, at least, toward unhealthy levels of concentration, and government sometimes needed to intervene to ensure the full benefits of competition. This was particularly true in the early stages of industrial development. This notion is now so deeply embedded in our laws that it has become all but invisible to us, replaced by secondary debates over the precise nature or extent of antitrust enforcement.

During the antitrust agitation of the late 1880s, Standard Oil consistently underestimated the ability of critics to marshal public support. Small businessmen, alleging that the great corporations thwarted individual opportunity, formed a particularly potent lobby for reform. When both Grover Cleveland and Benjamin Harrison inveighed against the trusts in the 1888 presidential campaign, Archbold wrote dismissively to Rockefeller that these strident speeches were just for show. “We do not think that much will come of the talk at Washington regarding Trusts,” he reported that summer. “The demagogues are simply trying to outtalk each other for political effect.”<sup>52</sup>

Archbold proved a poor prognosticator. In a legislative flurry, many states enacted antitrust laws in the late 1880s, while fifteen or sixteen bills circulated in Congress. From Standard Oil’s viewpoint, the most threatening bill was introduced in December 1889 by Ohio senator John Sherman, brother of General William Tecumseh Sherman. A few years earlier, Rockefeller tried to buy his way into the senator’s good graces. In August 1885, soliciting a campaign contribution for Sherman, Mark Hanna had told Rockefeller that “John Sherman is today our main dependence in the Senate for the protection of our business interests.”<sup>53</sup> Dubious at first, Rockefeller finally sent a check for six hundred dollars. Before long, the protector of business interests proved a turn-coat, flailing Standard Oil as a corporation so rich that it bought entire railroads. In debates over the senator’s antitrust bill, Standard Oil was constantly held up as a prime example of the problem to be remedied. Flushed into the open, Rockefeller took the unusual step of publicly rebuking Sherman’s legislation. “Senator Sherman’s bill is of a very radical and destructive character, proposing to fine and imprison all who directly or indirectly participate in organizations over which it is even doubtful whether Congress holds any jurisdiction.”<sup>54</sup>

The opposition of the trusts only hastened passage of the law. On July 2, 1890, President Harrison signed the Sherman Antitrust Act, which outlawed

trusts and combinations in restraint of trade and subjected violators to fines of up to \$5,000 or a year's imprisonment or both. President William Howard Taft later identified Standard Oil as the chief reason for the law's passage. To its proponents, the law proved a severe disappointment, a stillborn piece of legislation. It was vague in meaning and poorly enforced and so riddled with loopholes that it was popularly derided as the Swiss Cheese Act. By outlawing cooperative efforts through trade associations, it forced many companies into mergers to curb excess capacity in their industries, spurring further concentration and subverting the act's intention. As for the main target of the law, the Standard Oil juggernaut was not deflected by this nuisance. For many years, the Sherman Act was a dead letter, and big business happily went on as usual.

Rockefeller was never tempted to reconsider the issues raised by the Sherman Act. As far as he was concerned, practical, hardheaded businessmen had long ago resolved these issues to their satisfaction, and only fanciful scribblers and tendentious rabble-rousers saw the need to tamper with current practice, which had served the country well. He remained an unreconstructed believer in trusts. Never one to hold grudges in business, unfazed by the new law, Rockefeller supported the reelection of Senator Sherman in 1891.

*Captains of Erudition*

By the late 1880s, it seemed as if half the country wanted to lynch John D. Rockefeller, while the other half only wanted to cadge a loan from him. He was assailed by journalists, reform politicians, and embittered rivals but also besieged by a growing legion of flatterers and schemers with designs on his fortune. This national ambivalence must have confirmed Rockefeller's view that his critics were just envious hypocrites. The press fed this fascination with him. One 1889 newspaper article showcased Rockefeller as America's richest man, with a net worth of \$150 million—an estimate he regarded as much too high, pegging forty to sixty million as the correct range. (That would translate into between \$635 and \$950 million in contemporary money.) Another article clocked his income pouring in at \$750 an hour. Whenever such articles appeared, hordes of supplicants emerged, making bad publicity in many ways less troublesome than favorable coverage. "I have been run down by adventurers during the last few days, owing to some foolish newspaper article," Rockefeller complained after one flattering piece.<sup>1</sup> He mused, "Great wealth is a great burden, a great responsibility. It invariably proves to be one of two things—either a great blessing or a great curse."<sup>2</sup>

Wherever he went, he was now trailed by a small army of petitioners. For someone of Rockefeller's private nature, it was disconcerting to be approached in the street by strangers seeking money. "Mr. Rockefeller was constantly hunted, stalked and hounded almost like a wild animal," said Frederick T. Gates, the Baptist minister who would soon help to alleviate the problem. "Neither in the privacy of his home nor at his table, nor in the aisles of his church, nor during his business hours, nor anywhere else, was Mr. Rockefeller secure from insistent appeal."<sup>3</sup> Supplicants breakfasted with him, rode to and from work with him, dined with him in the evening, then retired with him to the privacy of his study. "The good people who wanted me to help them with their good work seemed to come in crowds," Rockefeller moaned. "They brought their trunks and lived with me."<sup>4</sup>

Rockefeller had always required rest and solitude, but by the late 1880s these petitioners had stolen from his daily schedule those all-important intervals of relaxation:

*At dinner they talked to me and, after dinner, when a little nap and a comfortable lounge, or a restful chair and a quiet family chat seemed about the most desirable occupations until bedtime, these good people would pull up their chairs and begin, "Now, Mr. Rockefeller—" Then they would tell their story. . . . There was only one of me and they were a crowd—a crowd increasing in numbers every day. I wanted to retain personal supervision of what little I did in the way of giving, but I also wanted to avoid a breakdown.<sup>5</sup>*

Mountains of mail tumbled in from around the globe, and by 1887 Rockefeller was so oppressed by appeals that he grumbled to brother Frank, "I have been overwhelmed with this sort of thing of late and want to shut down brakes a little until I can catch breath."<sup>6</sup> The begging letters—many scarcely literate, often scrawled in pencil in foreign tongues—typically pleaded for money to relieve some personal misfortune. People wrote to Rockefeller the way small children pray to God for presents. In 1887, a distraught lady told him, "I wish I could see you and talk with you as I can with God but it seems harder," while another woman confessed, "Last night as I lay thinking (for I could not sleep for the anxiety) asking the Lord for deliverance you came to me in a way that I could not banish it."<sup>7</sup>

The volume of mail defied the imagination. One steamer alone brought five thousand begging letters from Europe. After the announcement of one large educational gift, Rockefeller received fifteen thousand letters during the first week and fifty thousand by the end of the month. He needed a staff just to sift through these appeals. His overtaxed subordinates opened each envelope and tried to identify genuine cases of need, but they could gratify only a tiny fraction of such hopefuls. Many requests were frankly selfish, as Rockefeller tartly noted. "Four-fifths of these letters are, however, requests of money for personal use, with no other title to consideration than that the writer would be gratified to have it."<sup>8</sup>

Although Rockefeller didn't recognize it at first, brewing here was a personal crisis more debilitating than anything he had encountered in business. As early as 1882, he lamented to the Reverend Edward Judson that he was swamped by charitable appeals, many from Baptist causes. "I am about leaving Cleveland and have a regular deluge of calls from every hand. . . . I was up until eleven o'clock last night and the night before on this general character of work trying to help to devise ways and means."<sup>9</sup> Personal charity had long been his pleasure, his pride, his recreation, not something delegated to underlings, and he found it hard to break these honorable habits, especially in the midst of so much controversy about his business methods. As Gates noted of his early years, "He used to meet people, read letters, weigh appeals, send checks and receive grateful replies, all in his own person."<sup>10</sup> For such a perfectionist, giving money away was fraught with far more nervous tension than making it. He valued money too highly to dispense it lightly and wanted to investigate all requests before acting upon them. As the Lord's fiduciary, he was responsible for seeing the money well invested. As he said in 1886, "I haven't a farthing to give to this or any other interest unless I am perfectly satisfied it is the very best I can do with the money."<sup>11</sup>

***John D. Rockefeller striding briskly across the University of Chicago campus with William Rainey Harper. (Courtesy of the University of Chicago Library)***

Now, as the sheer magnitude of his wealth rendered his accustomed approach obsolete, he was frustrated that he couldn't give money away quickly enough to keep pace with his mounting income. It took several years before he learned to donate money in the systematic, scientific fashion that befitted the scale of his fortune. He needed to forge a new set of working principles for his charity, and it was in his creation of the University of Chicago that he came to define his future style as a philanthropist.

Rockefeller's involvement in the university started in a roundabout fashion through his friendship with the Reverend Augustus H. Strong, an eminent Baptist theologian and exponent of the social gospel. For seven years after the Civil War, Dr. Strong had served as pastor of the First Baptist Church of Cleveland, where he officiated at the funeral of Rockefeller's second child, Alice, who died in infancy. In 1872, he headed east to assume the presidency of Rochester Theological Seminary, the citadel of Baptist orthodoxy. Awed by the erudite piety of this Yale graduate, Rockefeller supplemented his income, paid his vacation expenses, and, heeding his entreaties, gave \$500,000 to his seminary over the years. A fine-looking man with a bushy mustache, Strong was grave, witty, and charming but tightly buttoned up and incapable of levity. An autocrat by nature, he didn't become convinced by an idea so much as possessed by it to an extent that other people could find insufferable.

Starting in the early 1880s, Dr. Strong began to pitch to Rockefeller a grandiose scheme for an elite Baptist university in New York City over which he would himself preside. Convinced that the Baptists were lagging in the denominational race, he feared that many young Baptists were going by default to Harvard, Yale, or Princeton. His "university of the future," as he dubbed it, would sit on Morningside Heights and cost Rockefeller a breathtaking \$20 million. Since New York was becoming America's foremost metropolis, Dr. Strong thought it a fitting home for this institution. Modeled after Johns Hopkins, it would accept only graduate students and research fellows, attracting the cream of Baptist undergraduates from around the country. Above all, the university would defend the faith against the encroaching forces of modernism, banning "infidel" teachers from the campus. This educational vision was Dr. Strong's monomania throughout the 1880s—he contended that he had a "divine mission" to promote it—and he badgered Rockefeller about it at every turn.<sup>12</sup> Strong knew how to couch his appeals in religious terminology and dress up self-interest as heaven-sent duty.

Hypersensitive to pressure, Rockefeller tended to stiffen up whenever he felt pushed. He feared the elaborate nature of Strong's project and grew deaf to his entreaties. Several times, he asked Strong to table the subject and finally imposed a moratorium on all further discussion of it. Rockefeller was always quick to spy the worldly ambition when men of the cloth falsely claimed to pursue godly objectives. Ordinarily, he would have made quick work of such a pushy supplicant, but he tolerated Strong out of respect for his scholarship as well as because of growing ties between their two families.

Whenever Dr. Strong returned to Cleveland, his children were among the very few who frequented Forest Hill, and the Rockefeller children were especially fond of his brilliant eldest son, Charles. Tall and handsome, with curly black hair, Charles would sit in their favorite beech tree, reading ballads to them while perched on a bough. At first, Charles was attracted to Alta, then moved on to her older sister, Bessie. The striking compatibility of the Strong and Rockefeller children must have comforted John and Cettie, who worried that less-religious children might spoil their wholesome environment. For years, John Strong corresponded with Edith and might even have proposed to her, while Junior had a schoolboy crush on Mary Strong, ten years his senior. Later, he wrote affectionate, flirtatious letters to Kate Strong—addressing her as "My dear sister Kate"—even though she, too, was many years older.

Bessie and Charles became so wildly smitten with each other that friends said they were almost foolishly in love. They might have been secretly engaged as early as 1885, when Bessie was nineteen and Charles twenty-three. Charles was a prodigious young philosopher, a perfect reasoning machine, who inhabited a cold world of abstractions. He graduated summa cum laude from Harvard in 1885, where he was both a pupil and a friend of William James. As the two star philosophers among the Harvard undergraduates, Charles and George Santayana cofounded a philosophy club and were natural rivals for the Walker Travelling Fellowship, which paid for two years of study in Germany. Santayana was so daunted by Strong's intellect that before the winner was announced, he prevailed upon Strong to split the prize. It was awarded to these two remarkable students with the understanding that they would divide the money.

In 1886, John and Cettie were searching for a suitable college for Bessie after she graduated from the Rye Female Seminary, and Dr. Strong accompanied them on a tour of Vassar, Smith, and Wellesley. That the Rockefellers finally opted for Vassar owed much to the fact that the strong-willed

Dr. Strong chaired its board of trustees. Since Bessie had eye trouble and found it difficult to read, Dr. Strong made special arrangements that allowed her to skip the entrance exams and room with a friend who read aloud to her. When Kate Strong decided to share a suite of rooms with Bessie, it seemed to seal a sacred bond between the two families—surely what the Reverend Strong coveted. He accomplished another strategic objective when Rockefeller became a trustee of Vassar and erected buildings bearing the names Strong, Davison, and Rockefeller.

The only Rockefeller daughter to attend college, Bessie must have been smart and tenacious to overcome her eye troubles. Her few surviving letters evoke a lively, appealing young woman. She was perhaps the most eloquent Rockefeller child, very fond of music and charitable to the poor. As one friend said, “Bessie was a slender rosy-cheeked girl, vivacious, pretty and charming.”<sup>13</sup> George Santayana, who met Bessie fresh from Vassar, fondly recalled her as “the image of vigorous health and good sense, nice-looking, frank, and with manlike college airs.”<sup>14</sup> Santayana always suspected that Reverend Strong conspired to marry off his eldest son to Bessie to snare the Rockefeller millions for his beloved university project. He also believed that Rockefeller had welcomed this match of his favorite daughter to a “good-looking, high-principled young man” who would “never separate her from her father, either in place or residence or in sound Christian sentiments.”<sup>15</sup> If those were the hidden hopes superimposed upon this youthful romance, both fathers were cruelly disappointed.

During the interval between his graduation from Harvard and his two-year German sojourn with Santayana, Charles underwent a spiritual crisis that had profound repercussions for the Rockefeller family. For two months, he preached in Salem, Ohio, then entered the Rochester Theological Seminary, where he was to study for the Baptist ministry under his father’s vigilant supervision. For the first year, he faithfully attended prayer meetings and taught Sunday school, but his rational Harvard education now corroded the spiritual verities of his youth. Later on, Charles made the terrible confession that he had lost his faith while correcting proofs of one of his father’s theology books. A wholly cerebral man, fearless in exploring forbidden thoughts, Charles realized that he could no longer accept supernatural revelation. He went to his father and announced that he couldn’t stay at the seminary and would openly declare himself an agnostic.

For Reverend Strong, it was a shattering moment—one that he later characterized as his life’s most agonizing ordeal. As a distinguished Baptist theologian, he had groomed Charles as his successor and boasted of his intellectual prowess, confident it would be put to the service of the faith. “He depreciates insight,” he said of Charles, struggling to comprehend his apostasy. “He is critical rather than constructive.”<sup>16</sup> Once his son decided to leave the seminary, the unforgiving Dr. Strong even had him excommunicated, bidding the First Baptist Church of Rochester to withdraw the “hand of fellowship” from his son because he had “ceased to believe in the fundamentals of doctrine.”<sup>17</sup> Only later did Dr. Strong realize that his own rigidly doctrinaire attitudes about religion had helped to drive Charles from the church.

Charles’s confidential admission must have stunned his father on several levels. If this loss of faith upset his marriage to Bessie, it might also derail Dr. Strong’s scheme to have Rockefeller finance a Baptist superuniversity in New York; it might even jeopardize Rockefeller’s future gifts to the Rochester seminary. It is not clear when Charles confided his spiritual turmoil to Bessie, or when Rockefeller became aware that his daughter’s suitor was a radical freethinker. Santayana’s comment clearly suggests that during Bessie’s courtship with Charles, Rockefeller was ignorant of Charles’s heretical tendencies and derived comfort from his sound views. This leads one to wonder whether Augustus and Charles—the one for money and the other love—tacitly decided to draw a discreet veil across Charles’s loss of faith.

The family association emboldened Dr. Strong to renew his pleas for a university in New York. While Bessie was still a freshman at Vassar, Dr. Strong dared to reopen the taboo subject. In a January 1887 letter, he began by telling Rockefeller that he had abided by his promise not to broach the forbidden subject, but time constraints now forced him to break long silence. “It has haunted me day and night for years,” Strong said of his proposal, “but I have had to keep my mouth shut. Meantime, years are passing and we are hurrying on to meet God.”<sup>18</sup> Competing plans were now afoot for a Baptist university in Chicago, and Dr. Strong panicked at the thought of others gaining ground on him.

Rockefeller rebuffed this overture, then sweetened the pill by giving another \$50,000 to the seminary. Since he admired Dr. Strong and didn’t wish to alienate him, he proposed that they travel through Europe that summer with Charles and Bessie. For Strong, this presented a miraculous chance to push his scheme in an intimate setting. “He accepted an invitation to tour Europe with Mr. Rockefeller for the reason chiefly, as he once told me, of using the opportunities daily association at leisure would give him of expounding his great theme and winning Mr. Rockefeller’s adherence,” said one theologian friendly with Strong.<sup>19</sup> In their travels, Dr. Strong planned to acquaint Rockefeller with the great European universities to whet his interest in founding an American school.

On the other side of the Atlantic, George Santayana was sharing the Walker Travelling Fellowship with Charles Strong in Germany and noted his friend’s moody behavior. In January 1887, Santayana wrote to William James that Charles was “very reticent about all personal matters, so that I know less about what has been troubling him than you probably do.”<sup>20</sup> A month later, Santayana told James that he had “no idea what has been the matter with [Charles] this winter except that evidently he has not been at ease.”<sup>21</sup> Charles kept his engagement to Bessie so secret that when he went to Paris that spring he didn’t tell Santayana that he was meeting the Rockefellers. Santayana caught up with the party in London, where they were enjoying the festivities of Queen Victoria’s jubilee. Though Santayana met and liked Bessie, he was repelled by Rockefeller, who seemed devious and avaricious as he meditated ways to expand Standard Oil sales to Spain.

Encouraged by their travels together that summer, Dr. Strong increased the pressure on Rockefeller in the autumn. He completely misread Rockefeller’s psychology. Where Rockefeller preferred a modest approach, Dr. Strong was often overbearing, as if trying to bully him into endorsing the project. He committed an unforgivable sin by suggesting that Rockefeller could sanitize his reputation by funding the university. “You have the opportunity of turning the unfavorable judgments of the world at large into favorable judgments—and not only that—of going down to history as one of the world’s greatest benefactors.”<sup>22</sup> This argument miscarried on several counts: Rockefeller resented any references to his infamy, felt no need to cleanse his reputation, and rebelled against any insinuation that his charity was selfishly motivated. Four days later, he decided to postpone consideration of Dr. Strong’s project.

Meanwhile, Charles Strong's suit to win Bessie's hand prospered, and sixteen months later, on March 22, 1889, Bessie Rockefeller, twenty-three, adorned with \$8,000 in pearls, married Charles, twenty-seven, in the front drawing room of 4 West Fifty-fourth Street in a marriage performed by Reverend Augustus H. Strong. With 125 guests, it was as opulent an occasion as the Rockefellers had ever staged, and Bessie's favorite teachers and classmates were brought down from Vassar in a private railroad car. The morning after the wedding, Charles and Bessie sailed for Germany so he could resume his philosophical studies, which explains why Bessie didn't finish her final year at Vassar. She was also suffering from psychological problems, the first sign of nervous symptoms that made her adult life a huge mystery to posterity. In his letters, Rockefeller urged her to avoid all unnecessary excitement and strain, old-fashioned advice that would prove increasingly inadequate in coping with her deep-rooted troubles.

Having piqued Rockefeller's interest in endowing a major Baptist university, the Reverend Augustus H. Strong had to ward off competing plans backed by no less spirited advocates. The most promising alternative, for a university in Chicago, had the advantage of building on preexisting foundations. In 1856, Stephen A. Douglas had contributed ten acres of land to start a small University of Chicago under Baptist auspices. It expired exactly thirty years later, the victim of debt and mismanagement. Many of its alumni considered this a disgrace to the Baptists and tried, at the last minute, to salvage the institution. Quite naturally, they turned to Rockefeller, who had aided the Baptist Union Theological Seminary in suburban Morgan Park, a sister institution. The seminary's secretary, Thomas W. Goodspeed, unfortunately broached his rescue plan to Rockefeller at an inopportune moment, when the latter was being hounded mercilessly by Dr. Strong; the proposal was consequently rejected. In spring 1887, on the eve of Rockefeller's European trip, Goodspeed again sounded out Rockefeller, but the titan cordially sent back fruit and flowers, not cash. Nevertheless, Goodspeed had drawn Rockefeller's attention to Chicago's merits as a home to a great Baptist university.

Goodspeed was a much better lobbyist than Dr. Strong, with a finer instinct for Rockefeller's sensibility. With snow-white beard and blue eyes, he was a dignified man who knew how to lobby a rich donor with exquisite tact as opposed to Dr. Strong's blunderbuss approach. He saw that Rockefeller flinched at anything that smacked of coercion and that patience was better than highpressure salesmanship. From the outset, Goodspeed made practical arguments, pointing out that construction costs were cheap in Chicago and that the Baptists lacked a first-rate midwestern college, forcing their children to study at eastern schools. Goodspeed was heartened by Rockefeller's response when the most gifted member of the Morgan Park faculty, the thirty-year-old biblical scholar William Rainey Harper, was being wooed by Yale. Rockefeller knew Harper's reputation as one of the foremost Baptist scholars of the Old Testament and urged Goodspeed to retain him at all costs. Though Harper was eventually spirited off to Yale, he stayed in close touch with Goodspeed and consistently supported a Chicago university project, though without committing himself to any role beyond a consulting one. As early as January 1887, he wrote to Rockefeller, "There is no greater work to be done on this continent than the work of establishing a University in or near Chicago."<sup>23</sup>

Rockefeller felt comfortable with worldly theologians, people determined to find an honored place in both this life and the next, and he was absolutely enthralled by Harper, the student of sacred literature who yearned to build an academic kingdom. Born in New Concord, Ohio, in 1856, Harper gave new meaning to the term wunderkind. He had entered college at ten, took a B.A. at fourteen, and completed his Ph.D. at eighteen. When this prodigy joined the Morgan Park faculty at twenty-two, he was younger than many of his seminary students. Many Baptist leaders recognized him as a man with a special future in the denomination, a dynamo bursting with energy and ideas. While still in his thirties, he opened Bible schools in five cities, founded a correspondence school, and coaxed seventy professors to join an American Institute of Hebrew that was assisted financially by Rockefeller.

While teaching at Yale, Harper often traveled to Vassar on Sundays to teach a Bible class and stayed with the college president, Dr. James M. Taylor. Since Rockefeller often visited Bessie for the weekend, Taylor brought the two together for breakfast, and the mutual attraction was instantaneous. Rockefeller later paid tribute to Harper as "a man of exquisite personal charm" and admitted that he had "caught in some degree the contagion of his enthusiasm. . . . As a friend and companion, in daily intercourse, no one could be more delightful than he."<sup>24</sup> Rockefeller didn't issue such glowing testimonials lightly.

Harper was a pudgy man with a soft, jowly face behind round, thick spectacles. He exuded optimism and captivated people with his visionary ardor. As one newspaper noted, "Dr. Harper is a marvel of energy. His face shows as much eagerness and aggressiveness as that of Luther."<sup>25</sup> Yet he had enough tact to steer clear of the pitfalls that tripped up the more egotistical Dr. Strong. In October 1887, fresh from his transatlantic voyage with Strong, Rockefeller invited Harper to lunch at 26 Broadway. The meeting went swimmingly, and a week later the impossibly busy and resolutely private Rockefeller cleared his schedule and spent an entire day with Harper—lunching with him at noon, then driving for a few hours in Central Park, then chatting again in the evening. For Rockefeller, this was an eternity of conversation. Equally unprecedented, he gave Harper a standing invitation to speak with him at any time. As he plumbed the plans for Baptist universities in different cities, Rockefeller always regarded Harper as an emissary for the Chicago group. After his heady day in Manhattan, Harper wrote excitedly to Goodspeed, "Again and again [Rockefeller] referred to you and to his thorough appreciation of your excellence and worth."<sup>26</sup> On future visits to Vassar, Rockefeller and Harper were often seen cycling around the campus together.

With all the hostile publicity directed against Standard Oil during the debate over the Interstate Commerce Act of 1887, it was certainly an auspicious time for Rockefeller to consider a major philanthropic bequest. The newspapers were now puffing him as one of America's richest men, possibly *the* richest man, so he was under a certain pressure to show that he could discharge this large responsibility. Education was a safe, neutral area in which he had twenty years of experience, having contributed generously to Denison University in Granville, Ohio; Indian University in Muskogee, Oklahoma; Barnard College in New York, which appointed Cettie to its first board of trustees; and Cornell University, whose president, Andrew D. White, he had met on a European trip. Most notably, he was the godfather of Spelman Seminary in Atlanta. Yet Rockefeller was, in many ways, an improbable university founder, for he was not bookish, never attended college, and operated more in a world of facts than theories. Having skipped college, he never automatically recommended it to young people, telling one minister, "I should say in general the advantage of education is to better fit a man for life's work. I would advise young men to take a college course, as a rule, but think some are just as well off with a thorough business training."<sup>27</sup>

Yet precisely because Rockefeller had missed college, no school could stake a claim on him. While he had the option of distributing his educational largesse widely, such dispersed giving didn't jibe with his philosophy. In religion and education no less than in business, Rockefeller thought it a

mistake to prop up weak entities that might otherwise perish in the evolutionary race. “I think mistakes are made by organizing too many feeble institutions—rather consolidate and have good, strong working church organizations,” he wrote in 1886—a remark that could have applied to his educational views.<sup>28</sup> In the long run, Rockefeller transposed to philanthropy the same principle of consolidation that had worked so well for him in business. Worn down by masses of people clamoring for his money, Rockefeller knew that he now needed a larger and more efficient method for disposing of his fortune. Without it, he would lapse into the slipshod amateurism that he detested. Dr. Strong and Dr. Harper had planted a vision of a large project in his mind, but it would require the careful tending of a lapsed Baptist minister named Frederick T. Gates to bring this seed to glorious life.

While Rockefeller was casting about for some means to spend money more liberally without compromising his scrupulous standards, a group of Baptist leaders met in Washington in May 1888 to form the American Baptist Education Society (ABES). The driving force behind this new association was Dr. Henry Morehouse, the executive officer of the American Baptist Home Mission Society who had advised Rockefeller on Spelman Seminary. Morehouse thought Baptist education was in a woeful state and urgently in need of reform. For Rockefeller, the new group was providential, promising to serve as a handy conduit for channeling large amounts of money to worthy, well-researched Baptist schools.

To serve as executive secretary of the new group, Morehouse drafted a fiery, articulate young Baptist minister, the thirty-five-year-old Frederick T. Gates, who had recently resigned a pastorate in Minnesota and now gravitated toward more worldly affairs. Soon after he assumed the post, Gates championed a Baptist university in Chicago to fill a glaring void. The eastern churches held more money, but the fastest-growing part of the membership resided in the Mississippi Valley and Great Lakes region. Before writing his report, he conducted an intensive study of Baptist education with prosecutorial zeal and ministerial fervor and he confirmed many of the arguments that Thomas W. Goodspeed had adduced. Because many Baptists schools were located in rural backwaters, midwestern congregants often attended schools of other denominations. Having tripled in size in two decades and ranking as America’s second largest metropolis with 1.7 million residents, Chicago seemed the optimal site for a major college.

Gates presented his findings in a richly detailed report that exhibited the exhaustive research that would endear him to Rockefeller. At the beginning, Gates, still unfamiliar with his patron, believed that Rockefeller would respond better to a bold plan than something tentative or equivocal. Hence, he portrayed this new Baptist university as the nucleus of a national educational network, confiding to Morehouse, “A scheme so vast, so continental, so orderly, so comprehensive, so detailed, will in my view capture a mind so constituted as Mr. Rockefeller’s is.”<sup>29</sup> On October 15, 1888, he electrified a Baptist convention in Chicago with an impassioned paper entitled “The Need for a Baptist University in Chicago, as Illustrated by a Study of Baptist College Education in the West.”

The Gates report has often been credited with convincing Rockefeller to opt for Chicago, yet William Rainey Harper provided timely assistance. Two weeks after Gates made his sensational address, Dr. Harper spent ten hours at Vassar with Rockefeller and then joined him on the train to New York. During this momentous day, Rockefeller first declared his intention to found a Baptist university in Chicago. As Harper informed Goodspeed, “[Rockefeller] himself made out a list of reasons why it would be better to go to Chicago than to remain in New York.”<sup>30</sup> Rockefeller leaned toward the Midwest for several reasons. He feared the complications that might result from the bullheaded Dr. Strong’s leadership of any New York school. He also worried that an eastern school might be encrusted with tradition, whereas a Chicago school could “strike out upon lines in full sympathy with the spirit of the age.”<sup>31</sup> Then there was a political dimension that Rockefeller never dared to articulate openly. He had to convince the public that he would not meddle or convert the school into a mouthpiece for his corporate interests. As he put it three decades later, Chicago “was sufficiently removed from Wall Street to encourage the hope that it would escape suspicion of being dominated by the so-called interests.”<sup>32</sup>

Twice during the next month, Rockefeller spent a day with Harper, first in Poughkeepsie, then in New Haven, for nonstop talks about the proposed university. Harper was astonished by his patron’s unreserved passion. “I have never known him to be so interested in anything,” Harper told Goodspeed, “and this promises much.”<sup>33</sup> Growing more enthusiastic by the hour, Rockefeller advanced a three-pronged plan for a college and university in Chicago, a theological seminary in New York (doubtless to placate Dr. Strong), and an educational trust of western colleges. This last step, a brainchild of Harper, envisioned a string of colleges throughout the West sharing common management with the Chicago university. Warming to the project, Rockefeller planned to visit Cornell on an inspection tour and court three Baptist professors for Chicago. In eloquent testimony to his commitment, Rockefeller told Harper of his readiness to give three million of the first four million dollars needed by the Chicago school. On December 3, 1888, the ABES formally endorsed the plan to found a new school in Chicago; ABES would be the official channel for Rockefeller’s contributions.

Then suddenly, in early 1889, Rockefeller grew aloof toward William Rainey Harper, who had committed the classic error of promoting his cause too assertively. What especially distressed Rockefeller was that Harper wanted to start with a full-blown university, whereas he preferred to begin with a college and expand incrementally. To break this impasse, Harper tactfully bowed out and allowed Gates to take charge of the lobbying campaign. A master at reading the minds of potential donors, Gates intuited that Rockefeller felt put upon by Harper’s quixotic plans and, to lessen his anxieties, he sent Rockefeller a scaled-down plan for a plain Chicago college. Much relieved, Rockefeller invited Gates and Morehouse for lunch on January 21, 1889. When Gates first set eyes on the great sphinx, he found him polite and decorous, if cryptic. “In parting with me,” Gates reported to Harper, “he said that his mind worked slowly in these matters, but he was glad to have had this opportunity for extended conversation, and closed by saying, ‘I think we are in the way of progress.’”<sup>34</sup>

An important upshot of the lunch was that Rockefeller invited Gates to accompany him on a train trip to Cleveland. Gates saw that a low-key approach was the perfect antidote to Harper’s rousing oratory, and he decided to let Rockefeller initiate discussion about the Chicago school aboard the train. “I think this was soon perceived by Mr. Rockefeller,” Gates said in his memoirs, “that it surprised and pleased him, and that he amused himself by putting my sense of propriety to the test.” Though the train left New York at 6 P.M., the two men never referred to what was uppermost in their minds. When they were joined by a phalanx of Standard Oil men, Gates noted the magnetic power Rockefeller had over them. “I observed that he spoke very little indeed, and always in a low and quiet voice.”<sup>35</sup> At one point, when the porter making up Rockefeller’s berth accidentally smacked him over the head, Rockefeller “uttered no word, made no exclamation, gave not one word of reproof to the careless porter, and reassured him when he offered profuse apologies,” recalled Gates.<sup>36</sup>

Having failed to broach the Chicago question with Rockefeller, Gates crept into his sleeping berth that night “a miserable, disappointed man.”<sup>37</sup> As it turned out, Rockefeller was coyly enjoying a cat-and-mouse game, and as they neared Cleveland the next morning, he began to pummel Gates with questions about the ABES. Rockefeller wanted reassurance that the ABES board was truly disinterested and devoid of unstated agendas. He also wanted Gates to make on-site inspections of schools and not rely on secondhand reports. On the strength of these assurances, Rockefeller decided to make the Baptist society his preferred vehicle for denominational gifts, an important first step on the road to wholesale philanthropy. Clearly, Rockefeller was contemplating new ways of distributing money through central agencies that could offer expert advice and buffer him from applicants.

Gates often marveled at the inexplicable ways of his new patron, who enjoyed keeping everyone in suspense. As the ABES board meeting approached on February 20, 1889, Gates awaited word of a large contribution from Rockefeller. Only as the meeting was called to order did a messenger arrive with a \$100,000 pledge to the organization. Later on, when Rockefeller asked him what the society did with the money, Gates said it went into a bank account that paid no interest. This so mortified Rockefeller’s sense of thrift that he borrowed back the \$100,000 and paid the society 6 percent. “I can’t endure to see that money idle,” Rockefeller told Gates. “I feel about it as one does to come into a room, ill swept, with the corners full of cobwebs and dust. I want to clean up that room.”<sup>38</sup>

In the spring of 1889, Gates went through another baffling period of silence. He was hoping to announce Rockefeller’s decision to bankroll a Chicago university when the ABES held its general meeting in Boston on May 18. At the last minute, Rockefeller advised Gates to stop by his home en route to Boston and listened silently to the latter’s appeal for a large commitment to the Chicago project. Sticking with his habitual policy of creative procrastination, Rockefeller promised nothing and invited Gates for breakfast the next morning.

After all these excruciating dilatory tactics, the campaign for a Chicago college or university reached a surprisingly swift climax on a clear spring morning in May 1889. After breakfast, the two men strolled to and fro before the Rockefeller house on Fifty-fourth Street. After months of stalling, Rockefeller said he was ready to provide \$400,000—considerably short of the figure he had quoted to Harper six months before. When Gates rejected this as insufficient, Rockefeller raised the ante to \$500,000. Once again, Gates spurned the offer, citing the advantages of Rockefeller contributing the majority of the money. Gates held out for a stunning \$600,000 contribution—equal to \$9.5 million today—which was predicated upon another \$400,000 being raised from other sources. Eager to commit this historic pledge to paper, they went down to Rockefeller’s office where he put his promise in writing.

The next day, clutching this paper, Gates rose before the Baptists in the Tremont Temple in Boston. Rumors had circulated about the gift, creating a tingling mood of expectation. “I hold in my hand,” Gates thundered, “a letter from our great patron of education, Mr. John D. Rockefeller.” A groundswell of cheers surged from the floor. “A letter in which, on the basis of the resolutions adopted by our board, he promises that he will give six hundred thousand dollars—” At this point, pandemonium erupted, with clergymen waving their handkerchiefs, whistling, and applauding. Driven to ecstasy by this earthly bounty, one minister on the podium flung his hat heavenward, while another theologian sprang to his feet and praised “the coming to the front of such a princely giver. . . . It is the Lord’s day. . . . As an American, a Baptist, and a Christian I rejoice in this consummation. God has kept Chicago for us; I wonder at his patience.”<sup>39</sup> On this note, the ecstatic holy men rose up to offer a lusty rendition of “Praise God from Whom All Blessings Flow.”<sup>40</sup> Overnight, for all his infamy in business, Rockefeller wore a golden nimbus in the eyes of many Baptists.

This was a bruising repudiation of Dr. Augustus H. Strong, who had ridden his hobbyhorse too hard and given the victory to his enemies. At first, it was exceedingly difficult for him to renounce his dream and concede defeat. Falling into deep dejection, he went on plying Gates with letters for Rockefeller until Gates had to inform him point-blank, “There is no hope. Mr. Rockefeller returned your letter to me with the request that the subject be dropped, and that I so write you as would leave no hope of any interest on his part.”<sup>41</sup> After a time, when Strong’s name surfaced in conversation, Rockefeller would drawl sarcastically, “Well, I hope Dr. Strong finds his man!”<sup>42</sup> It took Strong years to recuperate.

In June 1889, a few weeks after Rockefeller’s gift, Andrew Carnegie began to publish in the *North American Review* an influential essay entitled “Wealth.” Carnegie saw capitalism as threatened by the widening gulf between the swelling fortunes of the great industrialists and the meager wages of downtrodden workers. To defuse tensions and spread economic benefits more widely, he argued that the rich should donate large sums to worthy causes during their lifetimes, lest their money be frittered away by idle heirs. “The man who dies thus rich dies disgraced,” Carnegie declared bluntly.<sup>43</sup> Rockefeller was greatly influenced by Carnegie and when the Carnegie Library opened in Pittsburgh in 1896 dashed off a congratulatory note. “I would that more men of wealth were doing as you are doing with your money; but, be assured, your example will bear fruits, and the time will come when men of wealth will more generally be willing to use it for the good of others.”<sup>44</sup> Rockefeller was especially struck by the broadly systematic nature of Carnegie’s library program, which would bring some twenty-eight hundred public libraries into existence worldwide. When Rockefeller later addressed Marshall Field, Philip D. Armour, and other Chicago moguls about philanthropy, he echoed Carnegie’s plea to make bequests before they died.

In private, Rockefeller and Gates sometimes faulted Carnegie for letting his vanity peep out behind his benevolence. As Gates griped to Rockefeller, “Mr. Carnegie’s intimate friends tell me that it is no secret between them and him that he does these things for the sake of having his name written in stone all over the country. Have you observed that he always gives buildings while somebody else furnishes the money to keep them in repair?”<sup>45</sup> Rockefeller’s philanthropy was relatively discreet. Another tycoon might have been tempted to plaster his name on the Chicago college, especially during a contentious period that saw the passage of both antitrust and railroad-reform legislation. Yet this only hardened Rockefeller’s resolve to prove that he was not currying public favor. With the University of Chicago, his sole concession to vanity was to allow the trustees to affix his name to the school seal, official documents, and letter-heads. A proposal to place a lamp on the university seal was rejected, lest anyone mistake it for a vulgar allusion to oil. Even though Rockefeller was the Prospero who single-handedly conjured the University of Chicago into being, he didn’t allow any campus building to bear his name, and the Rockefeller Memorial Chapel was christened only after his death.

It was an auspicious time for such a venture. While enjoying the wealth of a nascent world power, America was still saddled with cultural institutions that seemed provincial beside their European counterparts, and many businessmen were eager to endow schools and museums. Rockefeller was not the only magnate to create a major university in the late nineteenth century: The railroad fortunes of both Johns Hopkins and Leland Stanford were similarly

applied, while closer to home Rockefeller had the example of the Pratt Institute, set up by Charles Pratt in 1887. Instead of making isolated gifts, Rockefeller wanted to finance institutions whose research would have a pervasive influence. Of the University of Chicago, he later said, “Following the principle of trying to abolish evils by destroying them at the source, we felt that to aid colleges and universities, whose graduates would spread their culture far and wide, was the surest way to fight ignorance and promote the growth of useful knowledge.”<sup>46</sup> To Rockefeller, the least imaginative use of money was to give it to people outright instead of delving into the causes of human misery. “That has been our guiding principle, to benefit as many people as possible,” he affirmed. “Instead of giving alms to beggars, if anything can be done to remove the causes which lead to the existence of beggars, then something deeper and broader and more worthwhile will have been accomplished.”<sup>47</sup>

Businessmen such as Rockefeller and Carnegie saw themselves as applying their managerial wisdom to the charity world. As at Standard Oil, Rockefeller wanted to reduce waste and duplication in the charitable sphere and deplored the lack of study behind much giving. “Today the whole machinery of benevolence is conducted upon more or less haphazard principles,” he stated in his memoirs.<sup>48</sup> The University of Chicago was Rockefeller’s signature project in which he clarified his approach and schooled Frederick T. Gates, his son, and other advisers as his future surrogates.

From the outset, Rockefeller swore that he would avoid the rich man’s trap of endowing institutions that would become dependent wards. His ideal was to create organizations that would take on independent lives and outgrow him. Having pledged \$600,000 for the Chicago college, he gave the ABES one year from June 1, 1890, to drum up the other \$400,000 from outside sources. To accomplish this, Gates moved temporarily to Chicago and joined forces with Goodspeed in a grueling fund-raising drive that nearly drove them to distraction. They were stymied by restrictions written into the school’s articles of incorporation, which stipulated that two-thirds of the trustees and the president be members of Baptist churches. If the enterprise’s spirit was ecumenical (several prominent Jews contributed), the institution’s charter was explicitly denominational. This confusion emanated from Rockefeller, who insisted that the new institution remain under Baptist auspices yet be “conducted in a spirit of the widest liberality,” with students drawn from every class of society.<sup>49</sup> Unfortunately, Chicago numbered few Baptists among its high-spending citizens. Instead of being stimulated by Rockefeller’s involvement, many potential donors smugly assumed that the fledgling school would never want for money. Of their excruciating year of pleading, Gates later said it “cost more brain work, anxiety, anguish, tears, prayers and shoe leather than all the millions that have since gone into the university.”<sup>50</sup> A promising contribution came in January 1890 when Marshall Field donated a ten-acre parcel for the new school on the south side of Chicago, just north of the site of an upcoming fair that would attract worldwide attention: the World’s Columbian Exposition. Delighted by this act of faith, Rockefeller agreed that he and Field would jointly review the names of proposed trustees.

Having devoted his career to eliminating risk from the petroleum business, Rockefeller was unsettled by the uncertainties that dogged the Chicago project. For a long time, the question of who would lead the college was every bit as vexing as who—besides Rockefeller—would support it. William Rainey Harper seemed the natural candidate. As the star salesman who had converted Rockefeller to the cause, he enjoyed his special trust. Whatever his occasional qualms about Harper’s flamboyant rhetoric, Rockefeller was sure the young biblical scholar had unique credentials to run the school. Although Harper might not have known it, Rockefeller revealed his thoughts to him in an unprecedented fashion. Right after Christmas 1888, Harper had dropped by 26 Broadway. Since Rockefeller had been ailing, he asked after his health and Rockefeller replied:

*I have made little progress, Doctor Harper. My wife has been sick and I have been anxious about her. My time has been taken up with the consideration of petitions from many sources—I have never known them so numerous. Montreal has come down upon me. Richmond, with a great reinforcement, has come down upon me. From every quarter the demands are growing more numerous, and more insistent. . . . I did not ask you to come and see me Sunday because I spent the day in bed; Christmas, too, I spent in bed—I was so tired. I have had some unusually worrying business matters in the last three weeks; still, the thing [the University of Chicago] is on my mind and I want to hear more about it.*<sup>51</sup>

For a man who lived behind the heavy draperies of Victorian reticence, this was a remarkably candid response.

The intuitive Harper sensed that something else was preying on his mind, and Rockefeller confided that he had received a jarring letter from Dr. Strong. While masquerading as a family Christmas greeting—Charles’s marriage to Bessie lay just ahead—it was a transparent attempt to sabotage Harper and the Chicago project. A self-styled inquisitor, Dr. Strong had examined the class notes of his daughter Kate, who was taking a Bible course at Vassar with Harper, and written to Rockefeller that he had unearthed heretical tendencies in Harper’s teachings. Rockefeller was far more disturbed by Strong’s defamatory tactics than the specific charges leveled against Harper. When Harper was next in Poughkeepsie, he was greeted by a letter from Dr. Strong, who threatened, as a Vassar trustee, to lodge an official complaint if Harper continued to teach the Sunday Bible class there. When Goodspeed found out about this mean-spirited attack, he said to Harper, “The man seems mad, daft.”<sup>52</sup>

Harper was always Rockefeller’s choice for president, and at times the venture seemed to hinge upon his acceptance. In his grandiloquent visions of this new institution, Harper was not above gently flattering Rockefeller, making the new institution sound like the collegiate equivalent of Standard Oil. “And let it be a university made up of a score of colleges with a large degree of uniformity in their management; in other words, an educational trust,” Harper advised him.<sup>53</sup> These sublime words both inspired and petrified Rockefeller. Hounded by requests for money, he didn’t know if he had the income to juggle so many commitments. In January 1889, he told Harper that they should start modestly with a college and defer the university till a later day. “So many claims have pressed upon me,” he explained, “I have not really needed a University to absorb my surplus.”<sup>54</sup>

Harper agonized over whether to take the presidential post at Chicago or stick with the biblical scholarship he loved. The question was a proxy for the larger issue of whether he sought power and status in life or the quieter rewards of scholarship. Harper was an original theorist and a charismatic teacher who hated to lose contact with his students, but he was also intensely ambitious. To pin him down, Yale offered him a generous, six-year compensation package that would allow him to hold two prestigious chairs at once. Learning of this, Rockefeller wrote Harper, “It would break my heart if I did not believe you would stay in the fold all right. For all the reasons I believe you will. Be sure you do.”<sup>55</sup> When Harper conferred with him two weeks later, Rockefeller pleaded with him to avoid any permanent commitment to Yale.

When the University of Chicago charter was adopted in May 1890, the school still lacked a president. To force the issue, Rockefeller dispatched

Gates to New Haven that July to notify Harper that he was the board's unanimous choice to head the school. Far from settling things, this only sent Harper into fresh paroxysms of indecision. In spite of Rockefeller's reiterated preference for a small college, Harper wanted nothing less than a full-fledged university and believed the one million dollars raised so far a mere pittance that fell short of his visions. As Harper wrestled with the dilemma, Rockefeller wrote to him in August, promising to add a premium to his salary. "I do not forget that the effort to establish the University grew out of your suggestion to me at Vassar and I regard you as the father of the institution, starting out under God with such great promise of future usefulness." <sup>56</sup> Harper must have noted Rockefeller's use of the hitherto taboo word *university*.

This letter alerted Harper to the fact that he now enjoyed considerable bargaining power in shaping the new institution, and his rhetoric only grew more sonorous. "The denomination and indeed the whole country are expecting the University of Chicago to be from the very beginning an institution of the highest rank and character," he replied to Rockefeller. "Already it is talked of in connection with Yale, Harvard, Princeton, Johns Hopkins, the University of Michigan, and Cornell."<sup>57</sup> Harper characterized the money raised so far as insufficient to realize such lofty aims. Among other things, he envisaged a university where he could perpetuate his own scholarly interests and act as president and professor. When Rockefeller consented to his demand for an extra million dollars to transfer the Morgan Park Theological Seminary to the new Chicago campus, the thirty-four-year-old Harper capitulated and formally accepted the presidency in February 1891. It now seemed clear that his spacious dreams would carry him beyond the small, cloistered world of a biblical scholar.

Over time, the immoderate Harper gave liberal interpretations to Rockefeller's vague promises of money, but he never misrepresented the scope of his plans. Even before accepting the presidency, he boasted to Rockefeller, "I believe that ten years will show an institution at Chicago which will amaze the multitudes."<sup>58</sup> Working sixteen-hour days, Harper now negotiated more than 120 faculty appointments in little more than a year. Rockefeller might think the university a plant of slow growth, but Harper wanted it to bloom overnight. The new president raided so many Ivy League faculties—the ranks of Yale and Cornell were especially depleted—that his ransacked rivals complained of foul play. Harper dangled sizable sums before reluctant prospects, enlarging the school's future financial requirements. This nationwide talent search netted nine college presidents for the first faculty. Harper signed up John Dewey and George Herbert Mead for the philosophy department and enticed novelist Robert Herrick to join the English department, while Albion Small initiated America's first graduate department in sociology. Another eminent recruit, economist Thorstein Veblen, came to regard Harper as the educational counterpart of capitalists such as Rockefeller and satirized him as a captain of erudition, one of a new species of empire builders in higher education.

However inspired he was by Harper, Rockefeller felt sorely beset by his extravagant spending, and their relations began to fray. With outside fund-raising stalled, it seemed that Rockefeller's worst nightmare was coming true: He would end up sole benefactor of an institution that would bleed him dry for years. Whenever they met, they stayed away from money talk and spoke of educational policy. Financial matters were shunted off into increasingly testy private exchanges between Gates and Harper—exchanges that Rockefeller reviewed privately. By the spring of 1891, Rockefeller began to develop the queasy sense that Harper regarded his money as a blank check to cover annual deficits. To their surprise and disbelief, Rockefeller and Gates saw that the new president would not drop his busy lecture schedule (which netted him \$4,000 a year) and contemplated a \$3,000 offer to head the Chautauqua School of the English Bible, while also planning a fancy European trip—all the while banking a handsome \$10,000 salary at the University of Chicago. As Rockefeller fumed in the summer of 1891, Gates met with Harper and urged him to shed his outside activities. "Of course he rejected these proposals," Gates informed Rockefeller, "as well as the intimation contained in it that his motives are not without their mercenary side."<sup>59</sup> It was an odd situation: the world's richest man chastising a biblical scholar for unseemly materialism.

To some extent, Rockefeller sent out conflicting messages and was partly to blame for Harper's profligacy. It was Rockefeller, after all, who urged Harper to pay top dollar for America's best academic minds. As Gates told Harper after one meeting with Rockefeller, "We talked *at great length* about salaries of head professors pro and con and as a result *he wished me to say to you positively that* the best men must be had."<sup>60</sup> Such talk could easily inspire a cavalier attitude toward money. Gates also had an ulterior motive for wishing Harper away from the lecture circuit. Though he was not the freethinker darkly portrayed by Dr. Strong, Harper did have heterodox religious views and brooded morbidly on his own heresy. Practicing the higher criticism, he had moved away from a stress on biblical inerrancy to a scholarly search for the authorship of sacred texts. Though becoming a modernist in his own right, Gates wanted Harper to muzzle his unorthodox views in public. Potential donors were already worried about the new university's diluted Baptism and questioned Harper's doctrinal purity. To one such critic, Gates insisted, "Dr. Harper is a man of evangelistic spirit and *annually secures scores of conversions at Yale*," implying that he would continue this practice at Chicago. <sup>61</sup> When Gates expressed concern to Harper about his views, the latter made a clean breast of his liberal religious views to Rockefeller so that he would never be shocked by his unorthodoxy.

The newspapers were not privy to these internal tensions and lampooned the implausible pairing of the trust king and the biblical scholar. Harper was irritated by cartoons that showed him sprinting after Rockefeller and his money bags. In one cartoon strip, Harper desperately pursued Rockefeller across a frozen Hudson River, hopping from one ice floe to the next until a weary Rockefeller dropped a thick wad of bills behind him to sate the university president. When Rockefeller later gave one million dollars to Yale, another cartoonist drew Harper astride a college building marked "University of Chicago," glaring enviously at another college building marked "Yale." Harper was often portrayed as a sycophant of the rich. In one cartoon, he was seen greeting fashionable ladies at the train station and carrying their luggage, which was marked "Proper Function of College Presidents."

There must have been moments in 1891 when John D. Rockefeller wondered how he had gotten entangled in a project so vast and headed by such a brilliantly erratic man. Had he known what lay ahead, it seems doubtful that he would have persevered. But he had now publicly staked his reputation on this hugely expensive endeavor and, in the last analysis, wherever William Rainey Harper led, John D. Rockefeller would grudgingly follow. He was not a man to abandon a project that had received his blessing.

However mingled with joy, Rockefeller's anguish over the University of Chicago came at a moment of physical vulnerability and tipped him over the edge toward a breakdown. Gates's letters to Harper are laced with references to their patron's sharply deteriorating health. In April 1891, Gates said after a tête-à-tête with Rockefeller: "He was kindness itself, but appeared very sad and depressed. . . . He even told me that anxiety and worry about the

matter [i.e., university finances] had made him sick and it was this that took him from his business and drove him to Cleveland. We *must* not press him for money. Let us see to it and see if we can not cut down expenses and get through the first year with the smallest possible deficit.”<sup>62</sup>

This was more than mere bluff or tactical posturing on Gates’s part, though there was doubtless some of that. Starting in early 1889, Rockefeller had complained continually of fatigue and depression. For several decades, he had expended superhuman energy in the creation of Standard Oil, mastering myriad details; all the while, pressure had built steadily beneath the surface repose. One could now see in his face the subdued melancholy of a man who had sacrificed too much for work. In early 1890, Rockefeller stayed away from the office for several months due to an unspecified illness. Later in the year, he promised to stop working on Saturdays and take more vacations, but the symptoms harried him into the following spring.

By 1891, the top executive ranks were beginning to thin at Standard Oil. Charles Pratt died suddenly that year, and Henry Flagler was increasingly distracted by his Florida hotel and railway ventures. Having groomed John D. Archbold as his successor, Rockefeller began to shift day-to-day power to his feisty, bantam protégé. More reviled than honored for his triumphs, Rockefeller, fifty-two, felt embattled by endless subpoenas from court cases and congressional hearings. Though he brushed off his critics as minor irritants and professed faith in his own integrity, it could not have been easy to face such universal opprobrium. Keeping up the pose of indifference must have taken its own toll.

Nevertheless, Rockefeller had come through earlier assaults unscathed. What really disturbed him was not so much making money but spending it. One Cleveland society woman, a friend, told a story of sitting beside him on a streetcar when the conductor came to collect fares. When Rockefeller handed him a quarter, the conductor deducted two nickel fares, assuming he would pay for the lady, and gave him fifteen cents change. “My change is five cents short,” Rockefeller declared. “Why, no. I took out two fares and gave you back fifteen cents,” explained the conductor. “But I did not tell you to take out two fares,” Rockefeller retorted. “Let this be a lesson to you, and never assume that a passenger is paying for two people unless he says so.”<sup>63</sup> Rockefeller reviewed every bill that arrived at home and often patrolled the hallways, turning off gaslights. Such habits were not simply reflexive stinginess but were rooted in bedrock beliefs about the value of money. When he discovered that one railroad overcharged him \$117 for carrying his family and horses, he had the Standard Oil treasurer immediately retrieve the money. “I need the \$117 to build mission churches in the West,” he explained, showing the association in his own mind between savings and charity.<sup>64</sup>

With such uncommon respect for the dollar, he couldn’t cope with the psychological demands of the University of Chicago and other philanthropic commitments. As Rockefeller said, “I investigated and worked myself almost to a nervous breakdown in groping my way, without sufficient guide or chart, through the ever-widening field of philanthropic endeavor. It was forced upon me to organize and plan this department upon as distinct lines of progress as our other business affairs.”<sup>65</sup> The figures of Rockefeller’s contributions between 1889 and 1892 reflect the expanding nature of his giving. From \$124,000 in 1889 (right before his big pledge to Gates), his donations soared to \$304,000 in 1890, \$510,000 in 1891, and then a spectacular \$1.35 million in 1892 (\$22 million today) as he opened the spigot for the University of Chicago. Clearly, he needed someone to help with the avalanche of appeals overwhelming him, and by late 1889 he began to forward begging letters to Frederick T. Gates. “I am disposed more and more to give only through organized agencies,” he told Gates.<sup>66</sup> Finally, in March 1891, suffering from broken health and all too aware of his mortal limitations, Rockefeller summoned Gates for a confidential parley:

*“I am in trouble, Mr. Gates. The pressure of these appeals for gifts has become too great for endurance. I haven’t the time or strength, with all my heavy business responsibilities, to deal with these demands properly. I am so constituted as to be unable to give away money with any satisfaction until I have made the most careful inquiry as to the worthiness of the cause. These investigations are now taking more of my time and energy than the Standard Oil itself. Either I must shift part of the burden, or stop giving entirely. And I cannot do the latter.”*

*“Indeed you cannot, Mr. Rockefeller,” Gates replied.*

*“Well, I must have a helper. I have been watching you. I think you are the man. I want you to come to New York and open an office here. You can aid me in my benefactions by taking interviews and inquiries, and reporting the results for action. What do you say?”*<sup>67</sup>

Gates accepted and in March 1891 transplanted his family to Montclair, New Jersey, and took up offices in the Temple Court, near 26 Broadway. This action, which ended his ministerial career, made him an earthly potentate instead. At first, Gates retained his position as secretary of the ABES and funneled Rockefeller money around the country. By 1892, Gates joyously proclaimed to Rockefeller, “Our denomination has a larger, better distributed, better organized, and more efficient educational property than any other denomination in America.”<sup>68</sup> Only after 1900 did the two men begin to branch out into the revolutionary schemes that transformed old-fashioned denominational charity into modern philanthropy. By that point, Gates had assembled a team of advisers tutored in Rockefeller’s principles, trained in his methods, and fired with his evangelical zeal.

For the remainder of his life, Rockefeller’s medical status provoked so much fantasy, gossip, and speculation that we should try to define it here with some precision. Rockefeller had been fit and youthful well into his fifties. He never adopted the sleek, portly look of his fellow plutocrats and seemed ten years younger than his age. What, then, ailed him in the early 1890s? Broadly speaking, the answer was overwork, brought on by the combined stress of work and charity. As his inseparable companion and homeopathic physician, Dr. Hamilton Biggar, said, “A little more of that would have killed him. Mr. Rockefeller was close to the edge of a breakdown . . . when he finally let himself be persuaded that he could no longer do the work of several men with the strength of one.”<sup>69</sup> But if overwork weakened his immune system, he also succumbed to opportunistic diseases. In 1891, a national gripe swept the nation, and Rockefeller was laid low. Dr. Biggar also diagnosed him as having a catarrh of the upper part of the bronchial tubes. For years, Rockefeller suffered from liver trouble—at one point he bought a “liver pad” from a local drugstore, wearing it with beneficial results—and in the early 1890s, Dr. Biggar plugged him full of an unnamed brew he had concocted for this trouble.

It was Rockefeller’s prolonged digestive troubles that most titillated the public, providing enduring satisfaction to moralists who believed that if Rockefeller could not be brought to justice, he could at least be tormented through his bodily afflictions. He had serious digestive problems in the early 1890s, perhaps even stress-related ulcers, and looked pale and haggard. For a time, to soothe his stomach, he lunched on milk and crackers at 26 Broadway, spartan fare that he enjoyed and sometimes even ordered by choice. He recovered from his digestive troubles, however, and they never

recurred in any really threatening way. Yet he remained extremely fussy about his food, taking small, sparing bites in a manner that spawned a thousand myths about his ruined system. For years it was bruited that he had a standing million-dollar offer for any doctor who could repair his stomach.

Those who believed that Rockefeller was suffering divine retribution would have been interested to learn that in November 1888 Cettie was seriously injured in an alcohol-lamp explosion that badly burned both her hands and face. She had to be bedridden for several weeks. Only a few mystifying references to this ghastly accident appear in Rockefeller's letters. One can't help but wonder whether the lamp was actually burning Standard Oil kerosene and whether Rockefeller turned it into an alcohol lamp in his correspondence. Would the wife of John D. Rockefeller have used alcohol lamps? If Cettie was the casualty of impure Standard Oil kerosene, her husband might well have viewed her accident as celestial judgment upon him.

During 1891, under doctor's orders, Rockefeller took time off from work and spent eight months at Forest Hill, the family's sovereign cure for illness. His private secretary, George D. Rogers, was placed under strict instructions to spare him all but urgent business matters. For the first time in twenty-one years, his mind was cleansed of Standard Oil. To restore his health, he worked with his farm laborers in the field, rode his bike, ate simply, and jokingly claimed he was becoming a "great concert singer."<sup>70</sup> These traditional remedies worked like a charm, for by June 1891 he wrote Archbold, "I am happy to state that my health is steadily improving. I can hardly tell you how different the world begins to look to me. Yesterday was the best day I have seen for three months."<sup>71</sup> By the end of the summer, he had gained fifteen pounds, fresh color was restored to his face, and he resumed a more normal schedule. On February 23, 1892, he had Gates post a letter to the University of Chicago trustees, pledging another million dollars with these words: "I make this gift as a thank offering to Almighty God for returning health."<sup>72</sup> In fact, the offering was as much a grudging response to Harper's improvident spending as a token of Rockefeller's gratitude to the Lord.

Having always enjoyed ruddy health, Rockefeller was evidently shaken by his lengthy illness, for he dreaded rushing back to work and precipitating a relapse. He now contemplated something inconceivable for most other restless tycoons of the period: retirement. He had no psychological need to spend his life amassing money and told Gates that he had all he wanted. As he later explained, "I felt that at fifty it was due me to have freedom from absorption in active business affairs and to devote myself to a variety of interests other than money making, which had claimed a portion of my time since the beginning of my business career."<sup>73</sup> Though he craved retirement, several crises tethered him to business for another three or four years until he stopped going to 26 Broadway altogether in 1897. In the meantime, he reported to the office less and less, as the focus of his life shifted slowly from earning money to dispensing it as intelligently as possible.

Although Harper had the founder's promise that he would attend opening ceremonies, Rockefeller, eager to prove that he would not meddle with the school, later rejected the idea. One also suspects that he subtly wished to telegraph his displeasure to Harper over the handling of university finances. In early 1892, Gates visited Chicago and was "utterly appalled" at the yawning chasm between Harper's extravagant schemes and the available money. Yet with all his openhanded spending, Harper had accomplished one of the great feats in education history. True to his wishes, he opened the school on October 1, 1892, without ceremony "as if it were the continuation of a work which has been conducted for a thousand years."<sup>74</sup> His hastily gathered faculty was so studded with renowned scholars that the university was catapulted instantly into the front ranks of higher education. On the first day of classes, the new school boasted 750 students, one-fourth of them women, with ten Jewish students, eight Catholics, and a handful of blacks.

Architect Henry Ives Cobb had little more than a year to summon a campus into being, and five major buildings were completed in 1892, another five in 1893. Built at a moment of civic pride, the new university sprang up beside the fabled White City of the 1893 Columbian Exposition. The fairgrounds featured a spectacular Standard Oil exhibit of a miniature refinery surrounded by a strange colonnade of Ionic columns with alternating oil-filled lamps and vases. From a Ferris wheel on the midway, visitors received a superb aerial view of the new school that Standard Oil profits had produced. Since Henry Ives Cobb also helped to plan the fairgrounds, the two projects appeared to blend into a seamless whole.

Once the university was inaugurated, President Harper did not stand still. Impulsive, never satisfied, he began to advance on a hundred fronts. Heedless of costs, he broached new initiatives to create a junior college, a night school, a correspondence school, extension courses for adults, a university press, a special division for laboratories, and museums. As leader of this educational trust, he wanted to dispatch scholars to teach at affiliated colleges in other states—an expensive initiative vetoed by Rockefeller. Harper also believed a university should benefit the surrounding city, and sociologists fanned out from the campus to undertake studies at Hull House and other settlement houses.

For all his pride in the university, Rockefeller dreaded this unbridled growth, which postponed the day when the new university might survive without him. Often, when Harper bagged another famous scholar, the university had to buy equipment for the newcomer—money Harper neglected to figure into his calculations. For all their mutual attraction, Rockefeller and Harper were destined to clash. As Gates framed the contrast:

*Mr. Rockefeller, with a breadth of vision as great as Dr. Harper's, was temperamentally cool, reserved, cautious, circumspect, deliberate, amazingly patient, but in the end, inflexible, adapting means to ends with long and accurate prevision. Dr. Harper was ardent, highly imaginative, with limitless capacity and insatiable eagerness for work, an undaunted optimist, minimizing difficulties, magnifying opportunities, rapid in conception, confiding, unsuspecting, bent on immediate results, willful, and impatient of opposition or delay.*<sup>75</sup>

As a businessman, Rockefeller believed in praying for good times while bracing for bad, and his recurring pleas for caution were vindicated in 1893 when panic seized the American economy and the university had to stall on paying salaries. To surmount the crisis, Rockefeller transferred another \$500,000 to the university that October. He was now drawn in so deep that he couldn't withdraw—and Harper knew it. Having sworn he would never cover operating deficits, Rockefeller had to renounce that policy and cover the budget shortfall for the next two years.

What made it so hard to enforce discipline in Chicago was that, after the obligatory protest, Rockefeller always came through with the money. In October 1895, Gates went to Chicago armed with a letter from Rockefeller pledging another three million dollars for the school's endowment—possibly the largest such sum ever given at one time by one man for educational purposes and worth about \$50 million today. Soon after, Harper and the university secretary, Thomas W. Goodspeed, attended a football game between Chicago and Wisconsin. During the first half, they told coach Amos Alonzo Stagg—who set up the first department of physical culture at an American university—about the gift. With Chicago trailing twelve to ten at

halftime, Stagg suggested that the team be informed “because I felt that it would be a strong piece of psychology to do so,” as he said.<sup>76</sup> When told by Harper of the gift in the locker room, the team’s captain roared, “Three million dollars!” and gave another player a gleeful slap on the back. “Just watch us play football.”<sup>77</sup> With that, the born-again squad streamed back onto the field and beat Wisconsin twenty-two to twelve. Later on, students lit a huge celebratory bonfire on campus and sang hymns to Rockefeller, including one that began, “There was a man sent from God whose name was John.”<sup>78</sup>

Despite a standing offer to tour his creation, Rockefeller declined to visit Chicago for several years, reluctant to have the university overly identified with his name. As Gates told Harper, “There are as you know advantages to the University (advantages in your canvass for funds) in the disinterested way in which Mr. Rockefeller has given his money.”<sup>79</sup> Beyond that, Rockefeller cherished his privacy and hated public occasions. When Harper finally persuaded John and Cettie to attend the first class quinquennial celebration in July 1897, he promised that Rockefeller would not need to speak. The patron’s ideal was to amble unseen through the campus for a couple of hours, an anonymous voyeur, relishing his creation.

As hundreds of students and professors, clad in caps and gowns, trooped into a huge tent in the central quadrangle on a sweltering July day, only one figure wore a plain frock coat and silk hat: the university founder, who marched, as he had since boyhood, with his eyes fixed on the ground. Far from being a fire-breathing mogul, he seemed quiet and faintly embarrassed by the fuss being made over him. When he got up on stage, three thousand people gazed in fascination at this reclusive American legend who had mesmerized the public as both a sinner and saint. It was so stifling inside the tent that hundreds of palm-leaf fans undulated in the audience. When Harper rose and reviewed the future needs of the university, he turned expectantly toward Rockefeller and referred to the pressing need for a hall to replace this temporary tent, eliciting an ambiguous smile from Rockefeller, who must have squirmed in his seat. Then the titan rose to address the crowd:

*“I want to thank your Board of Trustees, your President and all who have shared in this most wonderful beginning. It is but a beginning”—he was interrupted by frenzied applause—“and you will do the rest.” The audience quieted down. “You have the privilege to complete it, you and your sons and your daughters. I believe in the work. It is the best investment I ever made in my life. Why shouldn’t people give to the University of Chicago money, time, their best efforts? Why not? It is the grandest opportunity ever presented. Where were gathered ever a better Board of Trustees, a better Faculty? I am profoundly, profoundly thankful that I had anything to do with this affair.” A roar of appreciative laughter. “The good Lord gave me the money, and how could I withhold it from Chicago?”<sup>80</sup>*

Whatever his own discomfort, Rockefeller made an excellent impression. Before the day was out, he had laid cornerstones, listened to sermons, and given two more short talks. He spent the night at Harper’s house and was so unnerved by the absence of clocks—the visit made him deviate from his usual daily schedule—that he gave Mrs. Harper a thousand-dollar check as a gift and suggested she buy clocks. The next morning, Rockefeller mounted a bike and set off on a campus tour with university administrators in tow. Attired in a bicycle suit, he set off at a brisk pace, waving at cheering students along the route. The entourage flew down the midway to Jackson Park, circled the ghostly remains of the Columbian Exposition, stopped for refreshments, then whirled back down the midway. Rockefeller was enormously gratified and touched by the warm, spontaneous enthusiasm of the students. Everywhere he went they chanted, “John D. Rockefeller, wonderful man is he / Gives all his spare change to the U. of C.” Another knot of students burst into a fight song: “Who’s the feller? Who’s the feller? Rah, Rah, Rah / Rockefeller, he’s the feller, Sis, Boom Bah!”<sup>81</sup>

As a philanthropist, Rockefeller chose to cultivate a wise detachment from his creations and told Harper that he saw himself as a silent partner in the operation. Despite intermittent accusations to the contrary, he did not interfere with academic appointments or free expression, though sometimes tempted to do so. When several Chicago students denounced his monopolistic practices, an enraged Rockefeller complained to Gates of “statements from the students, derogatory to the founder, careless and inexcusable; but whether the report is correct, I do not know. . . . It seemed to me if . . . [it was] correct the men should be expelled from the Chicago University.”<sup>82</sup> In this and other cases, as best as one can tell, Rockefeller then countermanded the order, fearing the threat to academic freedom or at least to his own reputation.

It took courage to start a university in the 1890s, when academe swarmed with vocal critics of big business, and many of Rockefeller’s industrialist friends saw universities as so many breeding grounds for subversion. William chided his brother for sponsoring the school: “You are getting together a lot of scribblers, a crowd of Socialists who won’t do any good.”<sup>83</sup> Rockefeller wrestled with the issue but believed, on balance, that “while scribblers of the worthless kind brought poison with their ink to the minds of the people, yet multitudes of others come out of these institutions of learning to strengthen the good among us. Let us so hope.”<sup>84</sup> The University of Chicago was scarcely immune to the radical currents on campus. In 1899, while at Chicago, Thorstein Veblen published *The Theory of the Leisure Class*, which portrayed the new captains of industry as brutal troglodytes and exposed the primitive impulses lurking behind their gaudy consumption habits.

The best-publicized controversy about Rockefeller’s role at Chicago involved the dismissal in 1895 of a young political economist, Edward Bemis, who advocated municipal gas ownership and attacked the Standard Oil–controlled United Gas Improvement Company. The official explanation for the firing was that Bemis was more an activist than a scholar and did not measure up to the university’s high standards. Since Bemis had been hired by Harper himself and went on to a career of some distinction in utility regulation, one suspects a political motive behind his dismissal, yet there is no evidence that Rockefeller was the culprit. It seems more likely that Harper sacked him in anticipation of Rockefeller’s wrath. A year earlier, Harper had warned Bemis about his political activities after he made an inflammatory speech criticizing the railroads’ behavior during the Pullman strike. Such visible activism handicapped Harper in courting local business, as he made clear in a letter to Bemis in July 1894:

*Your speech at the First Presbyterian Church has caused me a great deal of annoyance. It is hardly safe for me to venture into any of the Chicago clubs. I am pounced upon from all sides. I propose that during the remainder of your connection with the university you exercise great care in public utterances about questions that are agitating the minds of the people.*<sup>85</sup>

Rockefeller refrained from such pressure because he knew the political value of his nonpartisan patronage of a university at a time when he was being accused of subverting other institutions to advance his own interests.

Rockefeller did, however, request a voice in fiscal matters—the one thing that Harper denied him. Like many donors, Rockefeller wished to give

freely, but Harper was constantly trying to speed up the process. In appointing Gates as his buffer with Harper, Rockefeller hoped to keep the university guessing about future gifts, but the tactic did not work. “Harper was insatiable in his appetite for money,” said one Standard Oil counsel. “Gates was the guardian of the treasurer.”<sup>86</sup> As time passed, the strains between Gates and Harper grew intolerable. Both men were idealists steeped in religion, marred by a streak of worldly ambition, and each accused the other of hypocritically exploiting Rockefeller for personal gain.

At first, Gates admired Harper as an inspirational figure who overspent out of naive enthusiasm. He later modified this sanguine view when Harper stoutly denied that a first-rate university could be run as an efficient business and declared, “A university that is properly operated always has a deficit.” When this remark appeared in the press, it grated on Rockefeller and Gates as rank betrayal.

According to Gates, Harper flouted several clear understandings with Rockefeller: that the university would never be indebted; would never use endowment funds for university buildings; and would never form an alliance with any medical college in Chicago. When Gates put these points in writing and asked Harper to circulate them to board members, they mysteriously disappeared. When he remonstrated with Harper for hiring more expensive professors and launching new journals, the university president simply ignored him. Soon after Gates insisted that he forgo new buildings, Harper appealed to Chicago’s citizens to support a new building campaign. Just as Rockefeller feared, Harper had rashly leaped straight from a small college to a big university.

As Harper rolled up deficits, his patron kept adding millions to the endowment, but he could only be pushed so far. As legions of business rivals had learned, he sometimes groped toward a solution then acted in a swift, decisive manner. “I warned Dr. Harper,” Gates said. “I warned him many times. I warned him in words, in deed and in every possible way.”<sup>87</sup> Sometimes, when Harper journeyed to New York, Gates thought the president had learned the error of his ways. Then Harper returned to Chicago and relapsed into free-spending habits.

After years of fruitless wrangling, the university was still struggling with a deficit of \$200,000 in early 1897 when Rockefeller decided he had had enough. Bypassing Harper, he summoned two representatives from Chicago, Goodspeed and Henry Rust, to meet with Gates and Junior. Rockefeller himself did not attend these meetings, leaving these negotiations to his proxies. On this historic occasion, Gates expressed Rockefeller’s disappointment at Harper’s failure to raise money from outside sources to reduce the deficit. As Gates pointed out, Rockefeller believed that nonprofit institutions should be even *more* circumspect with money than business organizations:

*[Rockefeller] feels that an institution of learning should be far more conservatively managed than, for instance, a bank, or even a savings bank or a trust company. These companies need only assure the depositor or investor that his funds will be duly cared for during the limited time in which they may be deposited. But a university invests the funds of those who are seeking to make an investment of money for the good of humanity, which shall last, if possible, as long as the world stands.*<sup>88</sup>

Like Dr. Augustus H. Strong before him, Harper had fundamentally miscalculated in approaching Rockefeller for money. Gates noted that Rockefeller had long ago planned to found a great university and had ample resources to do so. It was the cavalier, high-handed way that Harper dunned him for money that rankled. “Mr. Rockefeller comes instinctively to feel that the methods of securing his assistance are too often methods of compulsion,” said Gates. “The appeals come to him in the shape almost of forced contributions.”<sup>89</sup>

Though the meeting ended with Gates acknowledging Harper’s accomplishments, he had delivered a humiliating rebuke to his leadership. After reading a stenographic transcript of the meeting, Rockefeller asked that every university board member read it and took the unusual step of having it deposited in his safe as a personal testament of his future wishes for the school. Two months later, the University of Chicago trustees instituted drastic changes. Henceforth, Rockefeller would be notified of new expenditures and given a chance to protest. Gates had joined the board the year before, and Junior followed a year later, giving John D. direct representation in the university’s management.

The breach that had opened up between the university’s patron saint and its charismatic president was distressing to both men, who had enjoyed an intimate, father-son relationship. Now proscribed from asking Rockefeller for more money, Harper forfeited the easy access he had long cherished. For the emotional Harper, prone to both wild elation and inconsolable gloom, it was hard to be muzzled in his patron’s presence. According to legend, when prohibited from talking about money directly to Rockefeller, Harper circumvented the ban by praying aloud for money in his presence. The story, if true, suggests that he still had not absorbed the lesson that Rockefeller had reluctantly and repeatedly tried to teach him.

## Nemesis

Even as Rockefeller tried to shift his attention away from business in the 1890s, the political backlash against him gained fresh momentum, making it impossible for him to sever himself from his brilliant but tarnished record. As he tried to move ahead, his past loomed ever larger in the public imagination. During the next twenty years, it kept returning to haunt him, like an inescapable shadow.

The Sherman Antitrust Act had proved an ineffectual piece of legislation. The real threat to Standard Oil arose in an improbable spot: a small bookstore in Columbus, Ohio. In 1889, the state's young Republican attorney general, David K. Watson, wandered into the shop one evening and happened upon a slim volume by William W. Cook, cheaply bound in imitation leather and bearing the title *Trusts: The Recent Combinations in Trade*. He took the book home and perused it late into the night. In the appendix, Watson was fascinated to discover Standard Oil's trust deed, which he had never seen before. He was aghast to learn that for the past seven years Standard Oil of Ohio had violated its state charter by transferring control of the organization to mostly out-of-state trustees in New York. Capitalizing on this discovery, Watson filed a quo warranto petition against Ohio Standard in the state supreme court in May 1890, seeking nothing less than the dissolution of Standard Oil.

Standard Oil executives reacted, as always, by denigrating such measures as transparent harassment by their business enemies. Frank sent a letter to John saying that he was "not sure as to who the instigators are but believe Cleveland refiners have a hand in it" and conjectured that Watson was feeding off information from John Sherman.<sup>1</sup> In rebutting the charges, Standard's attorney, Samuel C. T. Dodd, offered the same legal fig leaf that the combine had exploited for years: that Ohio Standard shares had been transferred by individual stockholders, not the company itself, to its New York trustees. By now, the ruse was wearing thin.

Ironically, this sortie against Standard Oil came in a conservative, industrial state where its influence was pervasive. As a rock-ribbed Republican contributor, Rockefeller felt betrayed by such ingratitude and protested to a Cleveland friend that "we have not received fair treatment from the Republican party."<sup>2</sup> Never one to mince words, Mark Hanna, the party kingpin, sent a strongly worded message to Watson, telling him that "the Standard Oil Company is officered and managed by some of the best and strongest men in the country. They are pretty much all Republicans and have been most liberal in their contributions to the party, as I personally know, Mr. Rockefeller always quietly doing his share."<sup>3</sup> Although Hanna urged him to drop the suit, Watson would not relent. While Rockefeller blandly denied knowledge of Hanna's action, his memory was conveniently faulty, for on April 7, 1891, Hanna had written to him, "I caught our distinguished Attorney General Watson here the other day and gave him a piece of my mind."<sup>4</sup> Watson's successor, Frank Monnett, alleged that on six occasions Watson was offered bribes to terminate the case—in one instance as much as \$100,000 in cash—but Monnett never provided corroborating evidence, perhaps fearing Standard Oil reprisals against his sources.

Such intimidation, if it did occur, only stiffened Watson's resistance to pressure. On March 2, 1892, he won a famous victory when the Ohio Supreme Court ruled that Standard Oil of Ohio was indeed controlled by trustees at 26 Broadway and had to renounce the trust agreement. The trust was also accused of trying to monopolize every phase of the petroleum business. One enterprising reporter who rushed to 26 Broadway was assured that the decision would in no way affect the trust. When a reporter showed up on Samuel Dodd's doorstep, the Standard counsel was a model of urbanity: "The [trust] agreements were not really necessary," he said. "They were simply made as a matter of conscience. The only effect of the decision will be to inconvenience us a little."<sup>5</sup>

This insouciance was only partly studied. In responding to legal challenges, the combine had reconstituted itself many times, like some mythical, protean creature that could metamorphose into infinite shapes to elude lawmakers. For several years, Dodd and Rockefeller had studied possible responses in case the trust had to be dissolved in an antitrust suit. They had taken note of an 1889 New Jersey law that permitted corporations resident in the state to hold stock in other corporations. This revolutionary development opened the possibility of forming holding companies that could operate nationwide and provided a critical escape hatch for embattled trusts. As a result, Standard Oil calmly greeted the 1892 Ohio decision less as a mortal threat than an opportunity for a long-overdue reorganization.

For several days, Standard executives tried to figure out how best to comply with the ruling. Their minds were focused by the knowledge that if they didn't act, the New York attorney general was poised to file antitrust papers. On March 10, 1892, one week after the Ohio decision, Samuel Dodd announced that the trust would be dissolved. The next day, a mailing went out to all holders of Standard Oil trust certificates, summoning them to a March 21 meeting and inviting them to exchange their certificates for proportionate shares of twenty constituent companies. The distribution of power, money, and dividends within the Standard Oil empire would remain exactly the same, a deft maneuver that would be copied by other corporations harried by antitrust laws.

As the holder of 256,854 of 972,500 outstanding shares of the Standard Oil trust, John D. Rockefeller chaired the March 21 meeting. Even though 300 people were jammed into a room designed to hold only 200, the stage-managed event was brief and businesslike; the unanimous vote to dissolve the trust was a foregone conclusion. Though designated one of eight liquidating trustees, Rockefeller had just recuperated from the breakdown in his health and wanted to transfer the burden of reorganization to his colleagues. He was spared a terrible ordeal, since the liquidation proved highly contentious. Small shareholders balked at trading in trust certificates for fractional shares that paid no dividends and could not be redeemed in any secondary market. In the eyes of Standard's detractors, the exchange dragged on for a suspiciously long time.

Aided by changes in New Jersey's incorporation law, Standard Oil of New Jersey took on a unique status in the transformed company. Renamed Standard Oil (New Jersey), it bought in whole or in part huge blocks of stock in the other Standard companies and thus legally held stock in properties from coast to coast, functioning as both an operating and holding company. Standard of New York also attained new status in a reorganization that initiated the seven-year period of the so-called Standard Oil Interests.

The 1892 overhaul was mostly shadow play, a charade to appease the courts. The executive committee at 26 Broadway was formally dissolved, but the members lost only their titles and were soon converted, by the nicest legal cunning, into the presidents of twenty affiliated companies. In Standard parlance, these men were now the “gentlemen upstairs” or the “gentlemen in Room 1400.” Nobody had to switch seats at the lunch table, and Rockefeller and his coterie ruled as absolutely as before. Seventeen individual stockholders—almost all Standard Oil executives or family members—controlled a majority of stock in the twenty companies and elected their directors. This legal legerdemain again frustrated lawmakers who felt that the combine was so vast, slippery, and elusive that it could never be tamed or held accountable.

Standard Oil executives saw the major threat to the company in 1892 as the aging of their leadership. The organization was still piloted by the same sturdy souls who had steered it since the 1870s and were now beginning to die off or retire. The alarm bells must have sounded when Rockefeller sought retirement, a decision postponed temporarily by the economic crisis of 1893. The panic showed him functioning less as a Standard Oil executive than as a sovereign power, endowed with resources rivaling those of government. He continued, however, to operate in the shadows, a spectral figure whose presence was mostly felt, not seen.

The depression heralded by the June 1893 stock-market crash was one of such excruciating length, such grinding and unrelieved misery, that economic historians labeled it the Great Depression until that title was usurped in the 1930s. During the troubled summer of 1893, the Erie and Northern Pacific railroads failed, followed by many others bloated with debt and riddled with fraud. Mass unemployment across the nation sharpened class tensions. During the sanguinary clash a year earlier at the Homestead, Pennsylvania, steel mill, Henry Clay Frick had ordered Pinkerton detectives to fire at workers—a step that drew a rousing congratulatory telegram from John D. Such corporate truculence provoked calls by the new Populist Party for a graduated income tax, government ownership of railroad and telegraph companies, and tougher safeguards for trade unions. Rockefeller stood high on the list of bogeymen regularly berated by Populists, and legend has it that he began to sleep with a revolver by his bed. As the country grew more polarized, many people wondered whether America had paid too dear a price for the industrialization that had so quickly propelled it from an agrarian society to a world economic power.

By early 1894, the slump had toppled six hundred shaky banks, and an almost palpable threat of insurrection hovered in the air, prompting financial writer Alexander Dana Noyes to observe that “there were periods when industrial unrest seemed to assume the proportions of anarchy.”<sup>6</sup> In the spring of 1894, General Jacob Coxey of Ohio led his bedraggled Army of the Commonwealth of Christ in a doomed march on Washington to entreat Congress for legislative relief. Two months later, workers at the Pullman Palace Car Company struck to reverse massive layoffs and wage cuts, triggering a sympathy strike by the American Railway Union under Eugene V. Debs. When President Cleveland sent troops to Chicago, Debs was jailed, and seven strikers were gunned down. All the pent-up frustrations produced by the accelerated change of the late nineteenth century were vented in spontaneous, often violent dissent.

To the dismay of critics, Standard Oil and other trusts fared quite well during the prolonged downturn. Demand for illuminating oil and lubricants—now necessities of life—remained healthy, leading Standard Oil to prosper amid the general austerity. Meanwhile, a new source of future profits beckoned in the middle distance. In the early 1880s, Gottlieb Daimler strapped light gasoline engines onto bicycles, tricycles, and other vehicles, experiments that culminated in the motorcar, while another German inventor, Karl Benz, patented a three-wheeled automobile with a single-cylinder engine in 1886. In 1892, the Duryea brothers were tinkering with their first automobile. Recognizing a fantastic market in the offing, Standard Oil sent a representative to attend the test of a new gasoline engine for a streetcar motor. The next year, Henry Ford tested a two-cylinder auto that sped along at thirty miles an hour, resuscitating fears that existing oil supplies might fall short of needs—an anxiety somewhat assuaged by oil discoveries in Los Angeles and elsewhere in California in the 1890s. So remarkable was this West Coast boom that it soon furnished more oil than the old Pennsylvania and Ohio fields that had formed the basis of Rockefeller’s wealth. The advent of the automobile was a godsend for Standard Oil, for the more lightbulbs shone across America, the more kerosene was relegated to remote rural areas without access to electric power.

Standard Oil again benefited from hard times to extend its powerful reach. For several years, the trust had watched the exploits of Pittsburgh’s Mellon family with apprehension, and Archbold was under strict orders from Rockefeller to grab any of their oil properties that came on the market. As the Mellons emerged as a worrisome threat in the export market, Rockefeller feared they might strike an alliance with the French Rothschilds. In August 1895, having borrowed heavily against Pittsburgh real estate to build their budding oil empire, the Mellons were forced to sell their Crescent Pipe Line Company and other properties to Standard—a huge windfall that yielded 14,000 acres and 135 producing wells. It now seemed that Standard Oil owned the entire industry, lock, stock, and barrel. When the Geodetic Association announced plans to measure the earth, the *World* opined that the information would “enable the Standard Oil Trust and other trusts to learn the exact size of their property.”<sup>7</sup>

Soon thereafter, to everyone’s amazement, the independents, after so many hapless drubbings, rallied one last time and made a successful run at the trust. Through a new company, the Producers’ and Refiners’ Oil Company, a thousand well owners agreed to supply crude oil to fifteen independent refineries, linked by a new network of local pipelines. In the fall of 1892, that perennial Standard scourge, Lewis Emery, Jr., had organized United States Pipe Line, which now promised to give the rebels a vital pipeline to the seaboard. To lay the pipe, Emery’s men had to ward off savage harassment from the railroads; locomotives would roar by and douse them with scalding steam, boiling water, and glowing coals. Despite these obstructive tactics, independent oil began to flow in 1893. Shifting tactics, the trust then engineered a steep decline in kerosene prices—no mean trick in a period of rising crude prices. Squeezed by dwindling profit margins, three large independent refineries finally submitted to the trust’s suzerainty, but the Producers’ and Refiners’ Oil Company miraculously survived. In 1895, emboldened by a new sense of Rockefeller’s vulnerability, thirty independent refiners coalesced into the Pure Oil Company—the first enduring domestic competitor of Standard Oil. To preserve their autonomy, they sequestered half their voting stock in the hands of five men eternally sworn to keep it free of Standard influence. Thus, several years before federal trustbusters mobilized to smash the Rockefeller monopoly, serious competition had already taken root in the marketplace.

Despite this setback, Rockefeller was not hurting in the 1890s. There was now a self-perpetuating quality to his wealth. Whether he was gardening, eating, or just lying in bed, his prolific savings quietly grew around the clock. He was receiving about \$3 million yearly in Standard Oil dividends (more than \$50 million in 1996 dollars) and redirecting that into a vast portfolio of outside investments that made him a one-man holding company. With \$24 million now invested outside the oil and gas business, he held sizable stakes in 16 railroad companies, 9 real-estate firms, 6 steel companies, 6

steamship companies, 9 banks and financial houses, and even 2 orange groves.

The oil trust's resilience during the depression of the 1890s, its tested immunity from market fluctuations, cheered Rockefeller, who attributed this to Standard's large cash reserves and conservative dividend policy. The panic seemed to offer irrefutable proof to Rockefeller that cooperation was superior to the vagaries of cutthroat competition. It certainly allowed him the luxury of a benevolent paternalism at a time of labor strife in other industries. "We held things together so steady that our fortunate laboring men got their pay, though in other concerns many of them were compelled to go, and without bread," he later told William O. Inglis. "It was a matter of congratulation with us that we could look into the happy faces of our workmen in these perilous times and hand them the wages they had earned."<sup>8</sup>

Since the early 1880s, Standard Oil had been self-financing, very liquid at all times, and free from the thrall of Wall Street bankers. As a result, no other industrial corporation was so fearless or independent. It was one of Rockefeller's proudest boasts that unlike other trusts, he had not needed a J. P. Morgan to forge his combine. Standard Oil anticipated a major feature of the twentieth-century economy: the tendency of sophisticated, cash-rich corporations to outgrow their traditional bankers and become financial-service giants in their own rights. As journalist John Moody perceptively wrote, "The Standard Oil Trust was really a bank of the most gigantic character—a bank within an industry, financing this industry against all competition and continually lending vast sums of money to needy borrowers on high class collateral, just as the other great banks were doing."<sup>9</sup>

It was Standard Oil of New York that functioned as the main banker for the affiliated companies, governing what was arguably the most stupendous cash flow ever produced in American industry. To maximize its leverage over Wall Street, it scattered its gigantic balances among many banks; a single Standard Oil entity, the National Transit Company, sometimes kept as much as \$40 million on deposit. Standard Oil of New York also made large loans to banks, brokerage houses, railroads, and steel companies. So rich in cash, Standard Oil wielded a make-or-break power over Wall Street houses, which defied it at their peril. Standard directors often took out prodigious loans from the trust. On the eve of the 1893 panic, John D. had a \$1.36 million loan outstanding while brother William owed \$865,000.

As president of New York Standard, William Rockefeller parlayed his position into one of exceptional prominence on Wall Street. For John, the street might be a sinful haunt, but it had its own sulfurous charms for William. In 1884, while they both served as directors of the Chicago, Milwaukee, and St. Paul Railroad, William had met James Stillman, the youngest director of National City Bank. In an inspired move, Stillman recruited William as a director. By the time Stillman became the bank's president in 1891, National City had been so enriched by the Standard Oil bounty that it was nicknamed the Oil Bank.

When the 1893 panic struck, John D. was just emerging from the seclusion occasioned by his medical problems. He raced back to New York from Cleveland to orchestrate a massive salvage operation. In the course of the panic, he provided almost \$6 million to fifty-eight individuals and firms who were turned down by banks and desperately needed his intervention. To bail out these borrowers, Rockefeller had to borrow almost \$4 million, and nearly \$3 million of that came from Standard of New York. This was a tricky balancing act, since he was borrowing on the collateral of securities then collapsing in value. In October 1893, the Standard Oil treasurer, William T. Wardwell, having decided that Rockefeller had reached the permissible limit, did the unthinkable: He shut down the lending window on the company founder. A stupefied George Rogers relayed this verdict to his boss: "He has refused to give me any more money, because he had no assurance of getting it back when he wanted."<sup>10</sup> After frantic negotiations, Wardwell boosted Rockefeller's credit line to \$2.8 million in exchange for a lien on his quarterly dividend of \$775,000 from Standard Oil stock. Some of Rockefeller's letters reflect tragicomic confusion as he struggled to collect loans from debtors in order to pay off his own debt to Standard Oil. In early September, he wrote to Cettie from New York that he had settled his debts, with \$550,000 to spare. "We are steadily emerging from the panic, but I hope never to go through with another such experience."<sup>11</sup>

When it came to old friends, his generosity could be dazzling. When Captain Vandergrift telegraphed from Pittsburgh that a trust company he directed stood in mortal peril, Rockefeller telegraphed promptly, "How much do you want?" "One million dollars," came the response to which Rockefeller replied, "Check for one million is on the way."<sup>12</sup> But he was so inundated with pleas that many more people were spurned than saved, generating unavoidable bitterness. Frederick T. Gates referred to these painful quandaries in an October 1893 letter: "I have today on my desk urgent imperative appeals to save old friends [of Mr. Rockefeller's] amounting to many hundreds of thousands of dollars. I have incurred the enmity of many important business enterprises because I have had to decline to assist them in the last few days."<sup>13</sup> More than one person who was refused later accused Rockefeller of having ruined him.

During the panic, Rockefeller awakened to the public responsibilities attending great wealth. Having long been reflexively hostile to government, he now found himself cooperating with Washington to calm the jitters in financial markets. In 1894, the U.S. Treasury, alarmed by the outflow of gold that legally backed the gold standard, turned to J. P. Morgan for a rescue operation. After telling John G. Carlisle, the Treasury secretary, that this was impossible, Morgan conferred hastily with Stillman—a measure of Stillman's new stature on Wall Street. "He was greatly upset and overcharged," recalled Stillman, "nearly wept, put his head in his hands and cried: 'They expect the impossible!' So I calmed him down and told him to give me an hour and by that time I cabled for ten millions from Europe for the Standard Oil and ten more from other resources." When Stillman walked into Morgan's office to report the \$20 million, Morgan grew giddy and triumphant. "He took the pose of savior of his country and assumed all the credit," Stillman observed archly, crediting the real success to himself and Standard Oil. "But then you see, he is a poet; Morgan is a poet."<sup>14</sup> Rockefeller never claimed credit for his action and preferred no publicity.

Stillman's behavior during the panic had a deleterious effect on his relationship with Rockefeller, who had given him \$5 million amid multiple demands. Rockefeller believed that the crafty Stillman had not only held his money longer than necessary but employed it to buy stocks at bargain prices instead of using it to shore up his bank. Under any circumstance, Rockefeller would have been critical of an alliance between Standard Oil and a Wall Street bank, but after the 1893 panic his disenchantment with Stillman gave him extra misgivings about William's policy of placing large balances in his bank. One of Rockefeller's financial advisers, Henry E. Cooper, indignantly told him, "You ought to get after him hard!" "No, Mr. Cooper, we will do nothing," said Rockefeller evenly. "But we shall not forget it!"<sup>15</sup>

In November 1887, as he listened to Rockefeller testify before the new Interstate Commerce Commission, Henry Demarest Lloyd saw the witness as the prince of darkness, evil incarnate. Afterward, he furiously scribbled notes that he headed “Fanatic Standard Oil,” and had this to say about Rockefeller:

*He is . . . a depredator . . . not a worshipper of liberty . . . a Czar of plutocracy, a worshipper of his own Money Power over mankind. He will never sacrifice any of his plans for the restraints of law or patriotism or philanthropy. . . . His greed, rapacity, flow as a Universal solvent wherever they can, melting down into gold for him, private enterprise, public morals, judicial honor, legislative faith, gifts of nature. He will stop when he is stopped—not before. Not a tiger but a lynx . . . a make-up like that of the “gentleman pirate” of romance, think cold ruthless.*<sup>16</sup>

Convinced that Standard Oil was the archetypal trust, Lloyd embarked on a book-length study two years later, and by the time *Wealth Against Commonwealth* appeared in 1894, he was sure that the public was ripe for his revelations. As he wrote on the eve of publication, “the sky seems full of signs that the time for the appearance of such information has come.”<sup>17</sup>

Known as “the Millionaire Socialist,” the natty Lloyd had longish hair, wire-rimmed spectacles, and a flowing mustache, which gave him a vaguely artistic air. Among his friends he included Clarence Darrow, Jane Addams, Eugene Debs, and Booker T. Washington. He was toasted by many literary figures, and Robert Louis Stevenson called him a “very capable, clever fellow,” asserting that “he writes the most workmanlike article of any man known to me in America.”<sup>18</sup> A foppish reformer, Lloyd attended trade-union meetings wearing pince-nez on a gold chain, a gray top hat, and glossily polished boots. When he supported anarchists blamed for the Haymarket Square riot in Chicago in 1886, his outraged father-in-law, a co-owner of the *Chicago Tribune*, disinherited him and placed his estate in trust for Lloyd’s children. To maintain his existence as a dapper millionaire and literary troubadour for radical causes, Lloyd relied on his wife’s income.

Lloyd’s politics became more radical over time. With a messianic outlook, he had promiscuous sympathy for every crusade. Starting out as a free-market liberal, he then turned to socialism, trade unions, worker cooperatives, and utopian communities. He once referred to himself as “a socialist-anarchist-communist-individualist-collectivist-cooperative-aristocratic-democrat”—and that was just for starters.<sup>19</sup> Scarcely a cause in the Progressive panoply—from attacking tariffs to favoring municipal ownership of utilities to combating sweatshops—escaped his wide-ranging vision. Like Karl Marx, he believed in the inevitable collapse of capitalism, which he thought corrupt and predatory. Also like Marx, he imagined that competition led to monopoly—a welcome step since it was “a necessary and indubitable step toward national and international cooperation.”<sup>20</sup>

Lloyd returned to Standard Oil—the subject of his 1881 story in the *Atlantic Monthly*—for several reasons. Dismayed by the failure of the Sherman law to curb monopolies, he ridiculed it as “The Anti-Trades Union Law,” a mere ruse perpetrated by “a world-wide concert of action of a money power, crazy with greed, and fanatical to the hilt, to re-enslave the working people.”<sup>21</sup> He could also now draw upon a wide body of material churned up by government investigations against Standard Oil. Drawing on a small army of Rockefeller haters, including George Rice, Lewis Emery, and Roger Sherman, he gathered court records and trial transcripts, which he stuffed into pigeonholes at his home in Winnetka, outside Chicago. When one acquaintance visited him there, Lloyd told him, “I will prove that John D. Rockefeller is the most selfish usurper that ever lived.”<sup>22</sup> With Dostoyevskian passion, he filled notebooks with flaming diatribes against the American plutocracy, describing the Rockefellers and Vanderbilts as members of a “cruel, selfish, carnivorous, short-sighted herd.”<sup>23</sup> The lists of sensational titles he compiled for his Standard Oil book—including *Slime in Genesis*, *Fountains of Pitch*, and *Barbarians of Business*—said as much about his overheated imagination as they did about the trust.<sup>24</sup> In fact, Lloyd spouted so much fustian that it made it easy for businessmen to dismiss him despite his often accurate insights.

*Wealth Against Commonwealth* had no kind words to spare for Standard Oil. Lloyd marshaled every wispy allegation made against the trust and printed it as gospel truth. Where Ida Tarbell later portrayed Rockefeller and his cohorts as superb if immoral businessmen, Lloyd presented them as brazen criminals who owed everything to diabolical deeds. Later on, speaking privately of the “criminal character” of the Standard Oil executives, he insisted that they “ought to be in the penitentiary.”<sup>25</sup> Like his *Atlantic Monthly* piece, his book was chockablock with errors and egregious misrepresentations—for instance, he described the Rothschilds as Standard Oil’s agents abroad. Accusing Rockefeller of rigging artificial shortages to drive up kerosene prices, Lloyd failed to see that the trust maintained its dominance by keeping prices low and selectively engaging in predatory pricing. He ennobled any businessman, however greedy or inept, who opposed Rockefeller.

Yet for all its weaknesses, the book had a profound and lasting impact and ranks as a classic of muckraking literature. Lloyd was a superb stylist whose mellifluous prose captivated readers. Every paragraph was a call to arms.<sup>26</sup> Whatever the holes in his argument, he gave a clear, intelligent shape to a complex story, especially when it came to the importance of railroad rebates in the rise of Standard Oil. When he argued that the South Improvement Company never died but became Rockefeller’s master blueprint, he laid down a line of argument followed by Ida Tarbell. What also gave the book its force was Lloyd’s political message: “Liberty produces wealth, and wealth destroys liberty.”<sup>27</sup> As the trusts’ power rippled through society, he said, it corrupted every corner of American life. The noble experiment of American democracy was being undermined by businessmen who had grown more powerful than the state and controlled its elected representatives. “Our system, so fair in its theory and so fertile in its happiness and prosperity in its first century, is now, following the fate of systems, becoming artificial, technical, corrupt.”<sup>28</sup>

In *Wealth Against Commonwealth*, Lloyd omitted all names, even though Rockefeller, Flagler, and others were all too recognizable. Standard Oil was never mentioned and was usually referred to as the “oil combination” or some other euphemism. This technique protected Lloyd from libel prosecution, though he fell back upon a highfalutin explanation for it. “It seems of the highest importance that the book should retain its character of an *illustration* of the motives and results of our commercial civilization, not an attack on a particular corporation or body of men.”<sup>29</sup>

Lloyd’s manuscript found a publisher with difficulty. Mark Twain, who then had his own publishing venture, turned it down in deference to his close friendship with Henry H. Rogers. As Twain told his wife, “I wanted to say [to Lloyd] the only man I care for in the world; the only man I would give a *damn* for; the only man who is lavishing his sweat and blood to save me & mine from starvation and shame, is a Standard Oil fiend . . . but I didn’t say that. I said I didn’t want any book; I wanted to get out of the publishing business.”<sup>30</sup> Luckily for Lloyd, he won the passionate sponsorship of another literary luminary, his former *Atlantic Monthly* editor, William Dean Howells, who was bowled over by his indictment of Rockefeller. “I think that the

monstrous iniquity whose story you tell so powerfully, accomplished itself in our time, is so astounding, so infuriating, that I have to stop from chapter to chapter, and take breath.”<sup>31</sup> Howells steered Lloyd to Harper and Brothers, who agreed to issue the book if the author substantially condensed it, paid for publication, and guaranteed a sale of fifteen hundred copies—a deal only a rich radical could afford.

Published in 1894, the book passed through four printings within a year and sold a respectable eight thousand copies in its first decade. Some sour notes were heard amid the praise. The *Nation* began its scathing review by saying, “This book is a notable example of the rhetorical blunder of overstatement,” and it branded the book “five hundred pages of the wildest rant.”<sup>32</sup> Yet the work was praised widely by many reformers, including Louis Brandeis, and Edward Everett Hale called it the most important American book since *Uncle Tom’s Cabin*. Since Lloyd distributed free copies to politicians, it became the bible of Washington trustbusters.

With his penchant for melodrama, Lloyd claimed he had been tailed by Standard Oil detectives and told friends that he “expected to be *crushed* by the Standard people.” He seemed half disappointed when 26 Broadway reacted to his book with stern silence. Although colleagues informed him of the book’s accusations, Rockefeller did not read it and said Standard Oil “paid no more attention to all this nonsense than an elephant might be expected to pay to a tiny mosquito.”<sup>33</sup> Rockefeller now declined almost weekly requests to sit for magazine profiles, including one from a new magazine being launched by Samuel S. McClure, who was then in Paris trying to sign up an obscure young writer from Pennsylvania, Ida Minerva Tarbell.

Even after the publication of *Wealth Against Commonwealth*, Lloyd regaled friends with scurrilous gossip about Rockefeller, telling one correspondent, with cynical relish, that the mogul had recently gone abroad, ostensibly to recuperate from the strain of his charities. Sure that Rockefeller had left the country to divide up global oil markets with the Russians, Lloyd guffawed at reports that Rockefeller’s health had broken down under the crushing weight of his beneficence. “The wonder is that he expects people to believe that sort of thing, and that they do believe it!” Lloyd told a friend.<sup>34</sup> The irony, of course, is that Rockefeller spoke the unvarnished truth. Lloyd was always as blind to Rockefeller’s virtues as he was sensitive to his glaring vices.

By 1895, Rockefeller, age fifty-six, had begun to fade by imperceptible degrees into retirement. That year, he sat for a haunting portrait by Eastman Johnson that was commissioned by the board of the University of Chicago and that shows him toward the close of his business career. Set against a dark backdrop, the titan sits on a simple wooden chair, fixing the viewer with a fiery stare. His long, tapered fingers are delicately interlaced and his legs urbanely crossed, but there is a blazing intensity, an inextinguishable fire, in his eyes. Rockefeller still looks powerful and surprisingly youthful, but there is a sadness about him, as if he were stooped under a great weight and enveloped in unfathomable gloom.

Since he dated his retirement as early as 1894 and as late as 1897, there is some uncertainty as to when Rockefeller officially left 26 Broadway, but 1895 and 1896 are the likely watershed years. Though he was still suffering from sporadic digestive problems and nervous strain, the 1893 panic had forced him to postpone his departure several times. In explaining his retirement, the Rockefeller literature has always stressed his health and the heavy burden of his charities, though another factor contributed as well: He had perfected the gleaming machinery of Standard Oil, and, his appointed task done, he felt he should pass the reins to younger men. As Gates put it, the business “had ceased to amuse him, it lacked freshness and variety and had become merely irksome and he withdrew.”<sup>35</sup> By 1896, Rockefeller was skipping the daily lunch meetings at 26 Broadway and only occasionally exchanged memos with other executives. By June 4, 1896, he had already relinquished most of his duties, for he ended a letter to Archbold, “I shall be very pleased at any time to hear anything new that is important in the business, if it will not trouble you too much, or if you will kindly call Mr. Rogers.”<sup>36</sup>

In September 1897, Rockefeller suffered another medical setback, apparently related to circulatory problems, and his doctors insisted that he promptly transfer more day-to-day decisions to his representatives. “I do not call myself sick,” Rockefeller commented to one relative, “but this little warning I will promptly heed, as health is of the first importance.”<sup>37</sup> So in 1897—the year his son graduated from Brown—Rockefeller walked away from the empire that had consumed his energies for more than thirty years, and during the next fifteen years he scarcely appeared at 26 Broadway. He was succeeded by John D. Archbold, his jovial, pugnacious protégé, who gave a more defiant and combative tone to the trust in its duels with government investigators, committing a public-relations blunder of no small magnitude.

In a grave misstep, Rockefeller never publicly announced his retirement and retained the titular presidency of Standard Oil of New Jersey. As a result, he remained an inviting target for critics and was personally held liable for many of the questionable judgments made by Archbold, who was nominally vice president of New Jersey Standard.

In our age of an assertive business press, when corporate secrets are readily ferreted out by reporters, it is scarcely conceivable that the world’s richest man, running the world’s largest business, could have drifted away from business without public knowledge. Yet much of the press—to Rockefeller’s later chagrin—swallowed the cover story whole. While some reporters knew that he no longer reported to work, they doubted that he had really surrendered supervisory power. The misconception was understandable. He owned nearly 30 percent of Standard Oil stock—far more than anyone else—and did not hesitate to proffer advice as the urge seized him. Small groups of company lawyers and executives periodically briefed him, and Archbold made regular weekend pilgrimages to consult him at his Westchester estate. As trustbusters took dead aim at the company, Rockefeller was driven to develop a common defense with current executives, pulling him back into the past even as he tried to move on to new pursuits.

Rockefeller entered retirement just at the birth of the American automobile industry. As he noted, “When I retired from business . . . we had just begun to hope that some day [autos] would be practical.”<sup>38</sup> That year, Frank and Charles Duryea produced thirteen two-cylinder runabouts in Springfield, Massachusetts—the first time a car company had produced several cars from a standardized model—and Henry Ford put the finishing touches to the quadri-cycle, his first horseless carriage. The automobile would make John D. Rockefeller far richer in retirement than at work. When he stepped down from Standard Oil, he was probably worth about \$200 million—\$3.5 billion today—whereas, thanks to the internal-combustion engine, his fortune soared to \$1 billion by 1913—surely history’s most lucrative retirement, and one that must have softened the sting of press vituperation.

In 1897, Joseph Pulitzer’s *World* showcased John D. Rockefeller and Henry M. Flagler as two of the five chief overlords of the Standard Oil trust, yet

Flagler had now ranged even farther afield than Rockefeller. A man with many cronies but few close friends, Rockefeller reserved warm praise for Flagler. “You and I have been associated in business upwards of thirty-five years,” Rockefeller wrote to him in 1902, “and while there have been times when we have not agreed on questions of policy I do not know that one unkind word has ever passed or unkind thought existed between us. . . . I feel that my pecuniary success is due to my association with you, if I have contributed anything to yours I am thankful.”<sup>39</sup> Flagler repaid the compliment, telling one Baptist preacher that “if he would spend the remainder of his life in praising Mr. Rockefeller he could not say too much nor more than was actually deserved.”<sup>40</sup>

But these high-flown, touching tributes masked a certain *froideur* that had crept into their relationship as they neared retirement. Although Rockefeller never said so outright, one senses that he thought Flagler had become a slave to fashion and ostentation, a traitor to the austere puritanical creed that had united them. Though his hair and mustache were now dusted with gray, Flagler had a lean, handsome face and was highly susceptible to female charm. He had suffered many personal misfortunes in marriage and exercised woefully bad judgment. His consumptive first wife, Mary, had become a professional invalid. When doctors recommended an extended winter stay for her in 1878, Henry joined her in Florida, but, itching to get back to Standard Oil, he bolted for New York after a few weeks. Unwilling to stay alone, Mary followed him back instead of taking time to recuperate properly. When she died in May 1881, Henry felt profoundly guilty. At that point, he took stock of his life and decided he had sacrificed too much to business, telling one reporter, “I have been giving all my days to the Lord hitherto, and now I’m taking one for myself.”<sup>41</sup> During the winter of 1882–1883, he was hospitalized with a liver ailment and began to pore over newspaper articles about Florida land deals. In 1883, at age fifty-three, Flagler married Ida Alice Shourds, thirty-five, a former actress who had nursed Mary during her illness. A short woman with red hair, electric blue eyes, and an incendiary temper, Ida Alice seemed determined to run through Flagler’s money, gathering an expensive wardrobe and trying to buy her way into New York high society.

Whatever his reservations about the match, Rockefeller visited Henry and Ida Alice on their honeymoon in Saint Augustine, Florida, during the winter of 1883–1884. No less prophetic in his business hunches than at Standard Oil, Flagler had faith that Florida would someday be converted from a pestilential, mosquito-ridden jungle into a place of wonder, recreation, and exotic beauty. The next winter, when the Rockefellers and Flaglers again traveled to Saint Augustine, Henry bought several acres of orange grove as the site for the future Ponce de Leon Hotel. To cater to a less-affluent clientele, he added the Alcazar Hotel across the street, its façade patterned after the Alcazar Palace of Seville. As the resident railroad expert of Standard Oil, Flagler saw that Florida’s development had been retarded by inadequate transport, and in the late 1880s he bought two railroads that opened for settlement a coastal stretch around Ormond and Daytona beaches. Buying a large hotel on the Halifax River, he re-modeled it, grafted on an eighteen-hole golf course, and renamed it the Ormond Beach Hotel. Years later, John D. Rockefeller’s winter home, The Casements, stood directly across the street.

Driven by his faith in Florida’s future, Flagler merged his railroads in 1892 and conceived a master plan for a railroad that would snake down the length of Florida’s Atlantic coast to Key West, with Flagler resorts dotting the route—a vision he realized in 1912. Each time Flagler pushed the railway farther south, it opened more swamp to development, triggering another land boom.

As always when infected with development fever, Flagler ran up bills that taxed even his massive fortune. In 1890, he sold 2,500 shares of Standard Oil stock to Rockefeller for \$375,000 and made further stock sales to him for several years—right on the verge of the auto boom that would send those shares soaring. Rockefeller followed Flagler’s business adventures in Florida with sympathy but at a distance. “Henry did a great job in Florida,” he said. “Think of pouring out all that money on a whim. But then Henry was always bold.”<sup>42</sup> Yet he turned a deaf ear to his friend’s repeated entreaties to visit again. “I believe this country would be a revelation to you, if you would take a week to look into it,” Flagler pleaded with him in 1889.<sup>43</sup> Yet Rockefeller still stayed away from the state after his 1884–1885 visit. “It is marvelous what Mr. Flagler has wrought in that southern country,” Rockefeller told William Rainey Harper in 1898, “and I regret not to have paid him a visit long ago.”<sup>44</sup>

Why this sudden distance in so singular a friendship? When they did see each other, Rockefeller and Flagler were always nostalgic, yet they seldom contrived to meet. One suspects that John and Cettie were scandalized by the showy airs and sybaritic indulgence of Ida Alice Flagler. Bowing to his second wife, Henry had bought a private railroad car and a 160-foot yacht (both tellingly named the *Alicia*), and the Flaglers behaved more and more like the gaudy arrivistes the Rockefellers abhorred. Then Ida Alice began to show incipient signs of the mental illness that overtook her in later years. Out of the blue she began to chatter about her husband’s adultery—a real enough situation, but one magnified in Ida Alice’s fevered mind. In 1891, Henry became infatuated with Mary Lily Kenan, a beautiful, gifted twenty-four-year-old from a prominent North Carolina family who offered him respite from his moody, unstable wife, and Ida Alice became pathologically obsessed with this relationship.

During the summer of 1893, Ida Alice’s manic behavior worsened when she obtained a Ouija board. Closeted in her room, she spent hours communing with astral spirits, convinced the czar of Russia had fallen madly in love with her. When she threatened to kill Flagler in October 1895 and accused him of trying to poison her, she was committed to a sanatorium in Pleasantville, New York. In the spring of 1896, after the doctors declared Ida Alice cured, she returned to live with Henry at their large estate, Satan’s Toe, in Mamaroneck, New York. For a few happy weeks, they rode bikes together and read aloud to each other, suggesting a tenuous return to happier times. Then Ida Alice bribed a servant to smuggle in a Ouija board and promptly succumbed to old demons. Once back at the board, she relapsed into her paranoid dreamworld. When she flew at one doctor, wielding a pair of scissors, she was returned to the Pleasantville sanatorium in March 1897. There she renamed herself Princess Ida Alice von Schotten Tech and never saw Henry again.

After the courts ruled Ida Alice Flagler insane in 1899, Henry set up a trust fund for her, stocked with \$2 million in Standard Oil shares, which would appreciate to more than \$15 million by her death in July 1930. Henry, meanwhile, was in a bind: New York state law would not permit divorce on grounds other than adultery, and he could not prove adultery against a woman confined to an asylum. Never deterred by restrictive laws, Flagler switched his legal residence to Florida and applied his influence with state legislators. On April 9, 1901, a special law was enacted permitting divorce on grounds of incurable insanity—a law known as the Flagler divorce law. Within two weeks, Flagler married Mary Lily Kenan. The wedding was performed in high style, Flagler bringing friends down from New York in a private railroad car, but Rockefeller did not attend. He must have felt

Flagler was making a spectacle of himself, especially when he was named correspondent in a divorce suit in Syracuse, New York, one month after his marriage. That the Rockefellers had drifted away from Flagler is suggested by a note Cettie wrote her son in August 1900. “We have the announcement of Mr. Flagler’s marriage to a Miss Kenan, of N. Carolina. She is thirty-six, he, seventy-two.”<sup>45</sup> Cettie expresses no pleasure at the marriage, but only cites, with implicit disapproval, the difference in age. Mary Kenan was actually thirty-three at the time.

## The Dauphin

When he entered college in 1893, John D. Rockefeller, Jr., seemed like the prototype of the poor little rich boy, stuck with an overdeveloped conscience and the badge of being the son of one of the world's wealthiest men. Having had a rather solitary childhood in mansions and on estates, he did not have the social ease of other young men of his age and class. Desperately eager to please his parents, he had exhausted himself in trying to scrub sin from his soul.

Much like his father, Junior couldn't make decisions lightly and fretted over his choice of a college. Set to go to Yale, he passed its preliminary entrance exam and had even selected a room when reports reached him from one minister that a fast set dominated the Yale social scene. Others might have found this decidedly in Yale's favor, but Junior decided to look elsewhere and finally selected Brown because three close friends had chosen to attend it. As he told Dr. William Rainey Harper, whom he consulted, in a tone of excruciating humility, about the choice of schools, "Being naturally somewhat retiring (I beg you to pardon personal references), I do not make friends readily, and some of those interested in my welfare fear if I go to Yale in a class wholly strange to me, I will be 'lost in the crowd' so to speak and remain much by myself, instead of getting the social contact I so greatly need."<sup>1</sup> Junior tended to discuss himself clinically, as if he were a laboratory specimen wriggling under glass, his parents, especially his mother, having taught him to probe his behavior with such antiseptic detachment.

Junior entered Brown in September 1893, just as the industrial slump worsened, and his college years unfolded against a turbulent backdrop of radical rhetoric and labor unrest, much of it directed against his father. Founded in the eighteenth century, Brown was the oldest and best-endowed Baptist college, and its president, E. Benjamin Andrews, was a Baptist clergyman—cum—political economist. In those days, college presidents were often ordained ministers who had a profound impact on the student body in classroom and chapel alike. During the Civil War, Andrews had lost an eye in the Petersburg siege, and his glass eye endowed him with a visionary gaze. Junior admired his spiritual zeal and keen intelligence and was especially struck one day when Andrews told him, "Rockefeller, never be afraid to stand up for a position when you know you are right."<sup>2</sup>

Six months before Junior arrived at Brown, Andrews had composed a flattering letter to Henry Demarest Lloyd about *Wealth Against Commonwealth*. "It is decidedly in my line," he assured him, "although you are more radical than I am at some points."<sup>3</sup> Not averse to trusts, Andrews wanted to regulate them for the public good and distribute their benefits more equitably. When Junior took a course with him in practical ethics, Andrews gave him a finer appreciation for employer responsibility in big business. In one undergraduate essay, Junior already evinced the proclivity for corporate reform that would mark his adult life: "Who can look about upon the millions of laborers whose life is a treadmill, a continuous round of work to which they are driven by dire necessity . . . without being fired with a desire to revolutionize their condition by adopting the profit-sharing system?"<sup>4</sup> However idolized by students, Andrews was roundly condemned by many alumni when he supported William Jennings Bryan's presidential bid in 1896 and endorsed free coinage of silver, an episode that cost him his job. Henry Demarest Lloyd spied Rockefeller's fine hand in the ouster, telling a friend, "One of the reasons which actuated the trustees in crowding [Andrews] out was the statement that as long as he remained, Mr. Rockefeller would never give the university any money."<sup>5</sup>

The bashful young Rockefeller, quartered in Slater Hall, was much shorter than his father but broad chested and square shouldered. Both his mother and Grandma Spelman exhorted him to be vigilant against dormitory vice. In his first letter home, he reassured them by saying that he had already attended a prayer meeting, adding, "Grandmother will be interested to know that there are three colored men in the class."<sup>6</sup> He also had begun teaching a Sunday-school class at a Baptist church in Providence, and his relieved father wrote him that "the moral and religious tone seem of the best."<sup>7</sup> During his busy freshman year, Junior joined the glee club, the mandolin club, and a string quartet with some young ladies. As he ventured timidly beyond the self-contained world of his youth, he could not just enjoy spontaneous pleasure and had to justify it in terms of self-improvement. When he joined a college operetta, he wrote his mother, "Then too appearing on the platform before people as I would do and have done in the Glee Club gives me confidence in myself, and helps me to become easy in public which I always need."<sup>8</sup>

Doggedly earnest, tenacious in his studies, Junior was a good enough student to make Phi Beta Kappa, and he especially enjoyed economics and sociology. Unlike his father, however, his self-confidence was a fragile bloom, easily crushed. “If a person scolded me,” he said, “I shut up like a clam. I wasn’t much of a scholar, but I always tried hard and I didn’t like to be reproached.”<sup>9</sup> Everybody noticed his Baptist austerity: He did not drink, smoke, play cards, go to the theater, or even read Sunday papers. True to his temperance pledge, he plied students with crackers and hot chocolate when they came to his room, but he terribly upset Grandma Spelman when he let boys smoke there.

Junior’s frugality was the stuff of campus legend, and everybody had a favorite anecdote: how he soaked apart two two-cent stamps that got stuck together or how he pressed his own trousers, sewed his own buttons, and mended his own dish towels. Following his father’s example, he recorded every expense in his little book—sometimes to snickers from classmates—and even recorded bouquets of flowers bought for dates. Whether putting money in the plate at church or buying a pencil from a beggar, he jotted down everything to the last decimal. “He told me that his father allowed him all the money he wanted,” said a friend, “but insisted on an exact account of every penny.”<sup>10</sup> Another classmate recalled, “It used to be a great joke, particularly among the girls in Providence, and they used to laugh a good deal about being treated to a soda by John D. Rockefeller, Jr., and having him enter it into his book as he sat at the soda fountain.”<sup>11</sup>

Despite his shy formality, Junior was generally popular at Brown or, at least, highly respected. Some students were bound to see him as a hopeless prig, and one day as he was crossing the campus, one heckled him, “Here comes Johnny Rock, reeking with virtue and without one redeeming vice!”<sup>12</sup> For the most part, however, he became more sociable and self-assured and slowly weaned himself from the airless morality of his upbringing. He was tolerant by nature, telling Grandma Spelman in one letter, “One sees all sorts and conditions of men here viewing life, duty, pleasure and the hereafter, so differently. My ideas and opinions change I find in many ways. I would stickle less for the letter of the law, now, more for the spirit.”<sup>13</sup> Haltingly, he forged an identity separate from those of his forebears. He was more ecumenical, more open to the outside world, more considerate of alternate views. As president of his junior class, he got his classmates to desist from drinking alcohol at the class supper, which had traditionally been a drunken debauch. And when his class took its annual stag cruise to Newport, Junior agreed to keep kegs of beer on hand but tried to avert heavy indulgence. His parents were ecstatic. “Dear John,” his mother wrote, “you have been our pride and comfort from the day of your birth but at no time have we been more grateful for such a son as at the present moment—Tears of joy filled dear father’s eyes when your letter was read and he wants me to tell you how proud and happy it made him.”<sup>14</sup>

At Brown, Junior learned to savor such illicit pleasures as theater and dancing, small triumphs for a Baptist boy bred with such unrelenting morality. After his sophomore year, he took a bicycle trip through England with Everett Colby, a classmate whose father was a railroad builder. (John D. had invested in his ventures.) In London, Junior saw his first plays: *The Two Gentlemen of Verona*, *Charley’s Aunt*, and *A Midsummer Night’s Dream*. As if admitting to a furtive visit to a brothel, he told his mother: “I shouldn’t have done it at home on account of the example but thought it not harmful in London, where I knew no one and had an opportunity of seeing several of Shakespeare’s plays.”<sup>15</sup> Junior made it through his freshman year without dancing, then succumbed to this vice sophomore year by dancing all evening at a party thrown at the home of a university trustee. To practice for the event, he whirled his friend Lefferts Dashiell around his dormitory room. The whole evening, as he danced with a Miss Foster, he feared that he would crash to the floor. Holding on for dear life, he had the distinct impression that Miss Foster was propping him up. That evening, he met the vivacious Abby Aldrich, daughter of Rhode Island senator Nelson Aldrich, but could not muster the courage to dance with her. The love of dancing lasted, and by the time he graduated Junior indulged this sinful passion two or three times a week.

Cettie Rockefeller never entirely relaxed her militance about this pastime. During his senior year, Junior wanted to repay his classmates for their kindness to him and asked his parents to host a dance in Providence. Striking a compromise, John and Cettie agreed to have a musical evening of Mendelssohn, Bach, Chopin, and Liszt, followed by informal dancing. When they mailed out the invitations, the infernal word *dancing* appeared in small, almost apologetic lettering in the lower left-hand corner of the card. Yet when the evening arrived, Cettie developed a headache and took refuge

in her hotel room. As a result, Senior, resplendent in tails and white gloves, stood alone on the receiving line, cordially greeting three hundred guests. Cettie's behavior on this and other occasions supports the thesis that she retreated to her bed as an escape from threatening realities.

Before Brown, Junior had known little about sports: The Rockefellers were more interested in exercise, which stressed health, than in sports, which stressed pleasure. When he became a manager of the football team his senior year, Junior endured endless ribbing when he referred to the center as "the middle." He was so much his thrifty father's son that when one husky lineman asked for new shoestrings, Junior retorted, "What did you do with the pair I gave you last week?"<sup>16</sup> Because of his son's position, Senior, who had never been to a football game, attended one in New York between Brown and the Carlisle Indians. He started out in the stands, calmly surveying the spectacle, then grew so excited that he rushed down to the field in his tall silk hat and began to race up and down the sidelines with the coaches. The captain of the team assigned a lineman to explain the fine points of the game to him, and with his exceptional mind for tactical maneuvers John D. Rockefeller gave the impression that he had mastered the game, with all its subtleties, within five minutes.

Junior needed somebody who would release him from the suffocating prudery of his upbringing, and that liberating figure was Abby Aldrich. She was a confident girl who did not need his money and was not awed by his name. Something about the socially maladroit Junior appealed to the maternal instincts of this sophisticated young lady with the gracious manners and erect carriage of a senator's daughter. One of eight children, she had often hosted her father's Washington receptions and had met everyone from General Ambrose Burnside to William McKinley to Custer's widow. Tall, voluptuous, and somewhat matronly in appearance, she was handsome rather than pretty. She liked to wear broad-brimmed, eccentric hats, a symbol of her outgoing personality. She seemed to give Junior the faith in himself that his parents couldn't foster. As he said of their meeting sophomore year, "She treated me as if I had all the savoir faire in the world and her confidence did me a lot of good."<sup>17</sup> Through Abby, Junior made a startling discovery that had been artfully concealed from him: Life could be fun.

Abby came from old New England stock on her mother's side and was descended from Elder William Brewster, a passenger on the *Mayflower*. Though the son of a mill hand, Senator Aldrich claimed Roger Williams, the founder of Rhode Island colony, as an ancestor. Tall and virile, with thick mustache and side-whiskers, the unflappable Senator Aldrich had escaped from poverty, but he never lost his dread of it. He was elected to the U.S. Senate in 1881 and held that seat for the next thirty years, winding up as chairman of the Senate Finance Committee. A confirmed protectionist and devoted servant of the trusts, he used public office to feather his own nest. Bolstered by a \$5 million loan from the American Sugar Refining Company—the so-called sugar trust—he invested in four Providence street-railway companies while also representing the New Haven Railroad. Senator Aldrich turned public service into such a lucrative racket that he amassed \$16 million by his death. As if he were a mogul, not a public servant, he built a 99-room château at Warwick Neck on Narragansett Bay and sailed a 200-foot yacht, equipped with 8 staterooms and a crew of 27. He bore a host of pejoratives, most notably those conferred by Lincoln Steffens, who referred to him in *McClure's Magazine* as the "political boss of the United States, the power behind the throne, the general manager of the U.S."<sup>18</sup> Too entrenched to be ruffled by such journalistic pinpricks, Senator Aldrich stuck by his policy of "Deny nothing, explain nothing."<sup>19</sup>

Abby grew up in a lively atmosphere of balls, parties, and plays. Opposed to religious severity, Aldrich spoiled his children with presents and seldom disciplined them. At the Aldrich mansion at 110 Benevolent Street in Providence, the senator liked to play bridge or even poker with Abby. (In later years, Junior would not join the game but sat quietly with a book, unable to break that taboo.) A self-taught aesthete with a highly cultivated taste for books and art, the senator had an excellent library of antique books, frequented auctions for furniture, rugs, and art, and so thoroughly schooled Abby in European museums that she knew their paintings by heart. As a teenager, she dipped into the novels of Dickens, Trollope, Hawthorne, Jane Austen, and George Eliot.

Junior's romance with Abby played itself out amid a whirl of college dances, football games, tandem-bike rides, and canoe trips, as well as church services on Sundays. When they strolled along, Junior carried graham crackers in his pocket, and Abby freely reached in and helped herself. As Junior said, "She was so gay and young and so in love with everything."<sup>20</sup> By the spring of junior year, Junior was a regular visitor at Benevolent Street. One Sunday, he mentioned in passing to the senator his summer plans to cruise the Norwegian fjords with his sister Alta. The senator must have warmed to the idea of Abby marrying young Rockefeller, for a few weeks later he bought tickets for himself, his wife, and two daughters on the same ship, and they dined together during the cruise. Back in Providence in the fall, Junior saw Abby so frequently that people began to speculate when they would marry. But Junior approached the matter with the same soul-searching and nervous energy that he brought to every major decision, and he vacillated through four years of tortured introspection. It was perhaps apparent to everybody in Providence except him that he would someday marry Abby.

Certainly the size of his projected inheritance made the choice of wife a momentous decision. Junior idealized his father, and yet he had to deal with a mounting drumbeat of criticism against him. Abby seemed tailor-made to help him with this predicament, for they were both the children of public pariahs. Junior must have admired her ability to be the loyal daughter of a controversial senator while clinging to her own liberal beliefs. She lived in a way that betrayed neither her father nor herself and thereby pointed a path for Junior.

As he approached graduation, Junior still engaged in hero worship of Senior. His glorified image of his father was inextricably bound up with his lowly image of himself. On his son's twenty-first birthday, Senior sent him twenty-one dollars, along with a tender note. "We are grateful beyond measure for your promise and for the confidence your life inspires in us, not only, but in all your friends and acquaintances and this is of more value than all earthly possessions." To this, Junior replied, "People talk about sons being better than their fathers, but if I can be half as generous, half as unselfish, half as kindly affectionate to my fellow men as you have been, I shall not feel that my life has been in vain."<sup>21</sup> As Junior contemplated the duties that awaited him after college, the prospect only magnified his sense of inadequacy. Shortly before graduation, he was invited to join the board of the American Baptist Home Mission Society. When he asked his father's advice, Junior made clear that "my first duty as well as my pleasure after this year would be to help you in whatever capacity or position you might see fit."<sup>22</sup> He never wavered in this decision to subordinate his life to his father's.

As graduation neared, Junior grew wistful about his years at Brown and the relaxed camaraderie it had allowed him. He would shortly emerge into the spotlight of public attention, which would burn brightly for the rest of his life. As he thought of following in his father's footsteps, his courage failed him, and he told his mother soon after graduation, "I feel but little confidence in my ability to fill the position which is before me, but know that I am not

afraid to work or do whatever is required of me, and with God's help I will do my best.”<sup>23</sup> “The future is glowing with possibilities of service for God and man,” Cettie wrote back. “May the Holy Spirit take possession of your entire being, and guide you into all truth.”<sup>24</sup> By making him view life so loftily, by encouraging him to see himself as a valiant Christian soldier, she might have inadvertently exacerbated his anxieties. This transcendent perspective seemed to allow little room for normal human failure. Junior's father, meanwhile, remained inscrutably silent about Junior's forthcoming role at 26 Broadway, which could only have deepened his dread of the unknown.

When John D. Rockefeller, Jr., started work on October 1, 1897, he was entering 26 Broadway not long after Senior had left it. He was installed at an oak rolltop desk on the austere and slightly shabby ninth floor, in an office suite dedicated to his father's outside investments and philanthropies. He worked cheek by jowl with Frederick T. Gates, George Rogers, and a telegrapher, Mrs. Tuttle, who had the dubious honor of opening Rockefeller's crank mail—and “there was a great deal of it,” said Junior.<sup>25</sup> Though he worked in the Standard Oil building, Junior was uninvolved in its management, and he belonged instead to the incipient Rockefeller family office. If his \$6,000 annual salary, paid by father, seemed generous, it was a disguised allowance that kept Junior in a state of childlike dependence.

Junior turned aside suggestions that he go to law school or treat himself to an around-the-world trip. “I felt that I had no time for either, that if I was going to learn to help Father in the care of his affairs, the sooner my apprenticeship under his guidance began, the better.”<sup>26</sup> Junior was again living at 4 West Fifty-fourth Street and had ample opportunity to sound him out, yet the taciturn Senior provided no clues about what he expected of his son, leaving him in limbo. “Father never said a word to me about what I was to do in the office before I began work there, nor has he ever since. Moreover, he did not say anything on the subject to anyone else in the office, so far as I have ever learned. Apparently he intended that I should make my own way.”<sup>27</sup> Junior never admitted to being bothered by this tight-lipped approach. Like God, father's ways were mysterious but, it was always assumed, benevolent in the end. As a stout believer in self-reliance, Senior probably wanted to test his son's aptitude for business and let him find his own way without coaching.

Rockefeller had numerous channels of intelligence, and Junior marveled at his knowledge of everything that went on at 26 Broadway. At a certain point during dinner, Rockefeller would apologize to guests for changing the subject and query Junior about his day's work, displaying seeming omniscience about affairs downtown. Rockefeller's gentle, probing questions were the closest Junior came to a business education from him. Father and son disagreed more than they publicly acknowledged, and Rockefeller was once heard to grumble, “You know, boys go to college and come back knowing everything about business and everything else.”<sup>28</sup>

At work, Junior had no formal place in the hierarchy and had to guess at his powers. He performed some menial tasks, such as filling inkwells. Never given his father's power of attorney, he began to sign papers for him, unsure whether father would object; when he did not, Junior took this for a sign of approval and continued the practice. The first major task that Senior assigned his son was a ghoulish one: to supervise the design and transport of a soaring granite obelisk for the family burial plot in Cleveland, a shaft so huge it took up two freight cars. The young Brown graduate also picked out wallpaper for the family houses, sold worn-out buckboards and carriages, and managed Rockefeller real estate in Cleveland. One observer called it an “anxious and troubled” time for Junior, who felt that his performance was wanting, that he was not earning his keep, and that he was unequal to his appointed destiny.<sup>29</sup>

If Junior did not feel totally adrift in these years, the credit must go to Frederick T. Gates, who gave him the guidance he sorely missed from his father. Together, they toured iron ranges in Minnesota and timberlands in the Pacific Northwest, often playing violins together in their private railroad car. Gates invited Junior to audit business meetings, and he responded with everlasting gratitude. Under Gates's tutelage, Junior began to assume his rightful place in the Rockefeller firmament and joined the University of Chicago board just three months after starting work. While still in his twenties, he became a director of U.S. Steel, National City Bank, the Delaware, Lackawanna and Western Railroad, and, of course, Standard Oil.

Bowed by a sense of premature failure, Junior was desperate to succeed at *something* and decided to try his hand at the stock market. Since his father had professed a puritan contempt for Wall Street, Junior was surprised to learn that he had played the market for years and traded actively. To teach them the art of investing, Rockefeller allowed Junior and his sister Alta to borrow from him at 6 percent and invest in equities. During his maiden year at 26 Broadway, Junior made several thousand dollars in the market and, like all giddy novices, began to take more risks and place ever-larger bets.

Meanwhile, a Wall Street operator named David Lamar—later styled the Wolf of Wall Street—began to cultivate George Rogers, Senior's private secretary. In the fall of 1899, Rogers served as the gullible go-between for a scam. Transmitting information from Lamar, Rogers informed Junior that James R. Keene, a celebrated stock trader, had taken a big position in U.S. Leather and suggested that Junior join the buying. Led to believe that he was acting in concert with Keene, Junior took a gigantic stake in the stock. Upon learning that George Rogers was meeting secretly with Lamar at lunchtime, he had a queasy intuition of foul play. Junior summoned Lamar to his office, and he arrived with a flushed, agitated air. As Junior recalled, “One look at him was enough. I knew I had been sold out.”<sup>30</sup> It turned out Keene knew nothing of the affair and that Lamar was liquidating leather stock as fast as Junior bid it up. The unthinkable had happened: The meek Junior had dropped nearly a million dollars—equal to more than \$17 million today—of father's money in the market. He knew the situation was unforgivable: He had never asked to meet Keene, had done no research, and had thrown away a fortune on a wild tip.

One can only guess Junior's emotional turmoil when he broke this astonishing news to father, a harrowing meeting that was forever seared into his memory. “Never shall I forget my shame and humiliation as I went up to report the affair to Father. I hadn't the money to meet the loss; there was nothing else to do.”<sup>31</sup> Senior listened quietly and conducted a calm but thorough inquiry, investigating every detail of the transaction—all without a syllable of reproach. At the end, he simply said, “All right, I'll take care of it, John.”<sup>32</sup> Junior waited for some criticism, some outburst, some paternal homily about future behavior. But nothing further was said. It was a vintage Rockefeller performance: The true lesson lay in what he did not say and what he did not do. Rockefeller sensed that his insecure son had castigated himself so unmercifully that bitter reproaches were superfluous. By showing generosity, he enlisted his son's loyalty forever. The incident must have reinforced Junior's innate conservatism, for the one time he had entered into a rash, immoderate scheme he had been severely punished.

Working for months without a break, Junior began to carry a lot of pent-up tension. To purge this nervous energy, he went after work to the West Fifty-fifth Street stable, where his father's horses exercised in bad weather, and furiously chopped firewood from twenty-foot logs. Over lunch one day with Henry E. Cooper, a former Brown classmate, Junior brooded about his own inadequacy. Startled by the personality change, Cooper followed up with a letter of friendly advice. "You are altogether too grumpy, too morose and gloomy, John. . . . I truly think it would do you good, for instance, to take up smoking an occasional cigarette, or something of that sort. I am not joking. Just try being a shade more reckless or careless as to whether or not you reach perfection within five years, and see if you don't find more happiness."<sup>33</sup> Pathetically eager to please, Junior noted in his ledger a few days later, "pack of cigarettes— 10 cents." It was the last time he ever smoked.

Trapped on a treadmill of work, duty, and prayer, Junior found it hard to squeeze in time for Abby Aldrich. Sometimes on weekends, he took the train to Providence after work, dined with her, then grabbed the midnight train back to New York. In Manhattan, Junior often attended dances and parties with Alta, who was also living at home. She developed such an excessive attachment to her brother that she treated Abby as a rival and tried to undermine her. Alta's adamant opposition could only have prolonged Junior's doubts about marrying Abby.

Senior saw that his son could not carry his load lightly and begged him to relax more. Cettie, however, insistently pushed him forward in his quest for moral perfection. Two days after he began at 26 Broadway, she prodded him to join the Bible class at the Fifth Avenue Baptist Church, telling him to be "mighty in the Scriptures. The most powerful Christians are Bible Christians."<sup>34</sup> Sometimes she made it seem that humanity's salvation hinged upon his personal purity. In an astonishing letter of July 23, 1899, Cettie likened her husband to God and Junior to the Christ child. "You can never forget that you are a prince, the Son of the King of kings, and so you can never do what will dishonor your Father or be disloyal to the King."<sup>35</sup> Cettie's tone is especially revealing amid the rising attacks against Standard Oil. Much like her husband, she had fashioned an alternate reality in which, instead of being a corporate villain, he was converted into an American saint. There were no shades of gray permitted in the Rockefeller household.

Exhausted by work and beset by self-doubt, Junior pondered whether to marry Abby Aldrich and prayed daily for divine guidance for four years. "I always had a dread of marrying someone and finding out later that I loved someone else more. I knew a great many girls and I had so little confidence in my own judgment."<sup>36</sup> Things looked promising in April 1900, when Junior joined Senator Aldrich and Abby on a journey to Cuba aboard President McKinley's yacht, the *Dolphin*, a senatorial trip to study conditions there following the Spanish-American War. Still, Junior hesitated, unable to suppress his doubts. In the stuffy Rockefeller household, both parents and son balked at bringing up the subject. Finally, his sister Edith, acting as intermediary, told her brother that their parents were worried about him and felt that they were being kept in the dark, at last opening the forbidden subject to discussion.

In February 1901, Junior and Abby submitted to a six-month separation as a trial of their affections. After the time had expired, Junior was strolling by the lake at Forest Hill with Cettie when he summoned up the strength to ask her opinion of Abby Aldrich. Her hearty, laughing response was categorical. "Of course you love Miss Aldrich. Why don't you go at once and tell her so?"<sup>37</sup> Junior needed that maternal validation, that direct push. Soon afterward at West Fifty-fourth Street, he heard God's voice in the wee hours, blessing his choice of Abby. "After many years of doubt and uncertainty, great longing and hope, there came a supreme peace of calm."<sup>38</sup> Before dawn, he dashed off a letter to Abby, asking if he could visit her. Stopping off to see Senator Aldrich on his yacht in Newport, he asked for his daughter's hand and began to lay out his salary and financial prospects. Doubtless with some amusement, the senator brushed aside all money concerns and delivered the predictable bromide, "I am only interested in what will make my daughter happy."<sup>39</sup> An ecstatic Junior went to the Aldrich summer estate at Narragansett Bay and proposed to Abby by moonlight. "I can't believe that it is really true that all this sacred joy . . . is mine. . . . For so long, long a time it has been the one thing in life above all others that I have yearned for," Junior wrote his mother.<sup>40</sup> Abby then had six suitors, leading Junior to observe retrospectively, "I kept wondering why she ever consented to marry a man like me."<sup>41</sup> But she never regretted her decision. As she wrote to a cousin many years later, "Don't you think him quite the dearest man that ever was?"<sup>42</sup>

When the engagement was announced in August 1901, the press had a field day. "Croesus Captured," trumpeted one paper.<sup>43</sup> Many articles commented upon the odd match of the fun-loving Aldriches and the dour Rockefellers. As one paper said, "Young Mr. Rockefeller . . . is a Sunday-school teacher, and doesn't believe in cards, dancing or décolleté gowns, and Miss Abbie [*sic*] has never been able to make up her mind that she can renounce these things."<sup>44</sup> Although Senator Aldrich and Senior came in for their usual rough treatment, Abby and Junior were applauded for their more progressive views.

The extravagant wedding at Warwick on October 9, 1901, reflected the cosmopolitan style of Senator Aldrich, who made scant concessions to his Baptist in-laws. By chartered steamer and private railway car, he transported a huge portion of the American plutocracy to the affair, which glittered with Goulds and Whitneys, McCormicks and Havemeyers. The marriage was a satirical bonanza for muckrakers. As David Graham Phillips darkly interpreted the union, "the chief exploiter of the American people is closely allied by marriage with the chief schemer in the service of their exploiters."<sup>45</sup>

The affair began with a small private wedding, limited to thirty-five guests and presided over by the Reverend J. G. Colby, who had married John and Cettie thirty-seven years before. Then a thousand people trooped gaily through a vast reception in the ballroom. Senator Aldrich refused to truckle to the temperance views of his in-laws and personally selected an array of vintage wines. This was too much for Cettie, who developed chills, asthma, and diarrhea the night before the wedding and took to her bed for spiritual safety, skipping the ceremony the next day—an exact replica of her performance at Junior's senior-year dance at Brown. Once the stylish guests had fled, Junior and Abby spent a glorious month in seclusion at the house Senior had purchased in the Pocantico Hills of Westchester.

For the first months of married life, the newlyweds lived with John and Cettie at 4 West Fifty-fourth Street then crossed the street to a rented four-story mansion at number 13. Junior tried, with some trepidation, to initiate his free-spirited wife into the cramped, clerical ways of the Rockefellers, suggesting she might like to keep a weekly expense account. "I won't," Abby said bluntly, ending the matter forever. To a family muzzled by taboos, she brought a refreshing candor. When a visitor asked her, "Whatever are you going to do with this great big empty house, Abby?" she looked at him in

astonishment. “Why, we shall fill it up with children!”<sup>46</sup>

*The young Frederick T. Gates. (Courtesy of the University of Chicago Library)*

*The Standard Oil Crowd*

Outwardly at least, Frederick T. Gates was the antithesis of his famous patron, as florid and melodramatic as Rockefeller was cool and withdrawn. With close-set eyes that looked slightly crossed, head tilted to one side with a sardonic smile, the philanthropic chief often looked as if he was skeptically sizing up the world. A tall, well-built man with a restless, energetic air, he could talk with gusto for hours at a stretch, as if delivering a fiery sermon or Shakespearean soliloquy. Capable of tremendous flashes of wrath or indignation, he was colorful in both action and speech. When he pontificated, he threw his feet up on the desk, jabbing his finger through swirling cigar smoke, or jumped up from his seat, hair tousled, tie askew, to pace the floor with lawyerly deliberation. One colleague said he had “a voice that thundered out of Sinai” and he knew no middle ground in advocating a cause.<sup>1</sup> In a prose self-portrait, Gates described himself as “eager, impetuous, insistent, and withal exacting and irritable.”<sup>2</sup>

Like Rockefeller himself, Gates yoked together two separate selves—one shrewd and worldly, the other noble and high-flown. Born in upstate New York in 1853, not far from the Susquehanna River that flowed through Rockefeller’s boyhood, Gates was the son of a high-minded, impecunious Baptist minister, who had eked out a meager existence in small, impoverished towns. As a boy, Gates rebelled against the Puritan heritage that viewed earthly life as a melancholy sojourn. In his memoirs, he recalled that the “singing was pleasing, but otherwise Sunday school was a bore, as was church. I remember well my weekly relief when it was over and we could go home for dinner.”<sup>3</sup> Of his twice-daily prayers, he said, “If it taught anything, it taught us thus early that prayer is a mere empty form of words.”<sup>4</sup> The wonder was that the boy grew up to be a preacher.

When Gates was a teenager, his father went to Kansas for the American Baptist Home Mission Society, which only aggravated the family’s financial woes. Gates had to quit school at fifteen to help pay off their debt. For several years, he taught school and clerked in a dry-goods store and a bank, storing up valuable business experience. After briefly attending Highland University in Kansas, he entered the University of Rochester in 1875, where his interest in religion was rekindled. A good Baptist, he would not dance, play cards, or frequent the theater. Two years later, he entered the Rochester Theological Seminary, then under the sway of its president, Dr. Augustus H. Strong. Gates was briefly entranced by Strong’s theological system. “His instruction formed the foundation of our seminary course, and at that time it was almost wholly imaginary” was his later mordant judgment.<sup>5</sup> Gates was drawn to the ministry, not as a retreat into an otherworldly life so much as a liberation from poverty and academic drudgery.

After graduating from the seminary in 1880, Gates was assigned his first pastorate in Minnesota. When his young bride, Lucia Fowler Perkins, dropped dead from a massive internal hemorrhage after sixteen months of marriage, the novice pastor not only suffered an erosion of faith but began to question the competence of American doctors—a skepticism that later had far-reaching ramifications for Rockefeller’s philanthropies. A period photo shows a handsome young man with a long, lean face, a handlebar mustache, and a somewhat wistful air. After launching into “a zealous campaign to convert sinners,” Gates soon lightened up, scrapping much of the scholastic baggage he had picked up in the seminary. To succeed as a pastor, he decided that he had to study the economic, intellectual, and social forces of his time. A biblical modernist, he employed science, history, and reason to explicate sacred texts. He also worked to retire the church’s debt and wrote essays for the *Minneapolis Tribune*.

After eight years in Minnesota, Gates, thin and emaciated, seemed destined for a career as threadbare as his father’s. Then one day in 1888, heaven sent relief in the shape of a rich man, George A. Pillsbury, a founder of the flour fortune, the state’s wealthiest Baptist, and then the mayor of Minneapolis. He told Gates in confidence that he suffered from an incurable disease and needed advice about making a \$200,000 bequest to a local Baptist academy. Gates advised Pillsbury to start out by giving the academy \$50,000, contingent on the Baptists raising an equal sum—what we would today call a matching grant—then leave the remaining \$150,000 in his will. Gates was subsequently drafted to drum up the \$50,000, which he did so superlatively well that he threw up the ministry for good and became executive secretary of the new American Baptist Education Society. His contact with Rockefeller and involvement in the University of Chicago followed soon thereafter.

Those Baptists who thought they had slipped an advocate into Rockefeller’s inner sanctum were grievously disappointed. At first, Rockefeller still gave disproportionately to Baptist causes, as missionaries from every continent descended upon Gates’s office in droves. But despite his fondness for Baptist clergy, Rockefeller was also exposed to many greedy, calculating pastors and began to retreat from the sectarian spirit that had guided his giving. As Gates said, “I think his greatest trouble was with ministers because he had a natural liking for them and they were always trying to get money out of him.”<sup>6</sup> By 1895, Rockefeller told Gates that he wanted to give to the five main Protestant denominations. This delighted the lapsed minister, who had grown so dismayed by the Baptist church in his town of Montclair, New Jersey, that he had switched to the local Congregational church. He was increasingly convinced “that Christ neither founded nor intended to found the Baptist Church, nor any church.”<sup>7</sup>

For someone like Gates, torn between heaven and earth, serving as Rockefeller’s chief philanthropic adviser was an ideal synthesis. When they started working together in 1891, Rockefeller was fifty-two and Gates thirty-eight. In spite of his uncommon intelligence, Gates often felt self-conscious under Rockefeller’s icy scrutiny. As he grew more comfortable in his presence, he developed a powerful loyalty to him. “I will do my best to serve in any business capacity,” Gates humbly told him early on, “but I beg you not to place any confidence in me (I have little in myself) and to begin with matters in which I could not possibly do much harm.” He ended by saying, “No one but my father has been so kind to me.”<sup>8</sup> Having long chafed at a minister’s salary, Gates could now indulge his ripest fantasies of wealth. Where his father had made less than \$400 a year, Gates started with Rockefeller at \$4,000 a year, his salary rising to \$32,000 by 1902.

What Gates gave to his boss was no less vital. Rockefeller desperately needed intelligent assistance in donating his money at a time when he could not draw on a profession of philanthropic experts. Painstakingly thorough, Gates combined moral passion with great intellect. He spent his evenings bent over tomes of medicine, economics, history, and sociology, trying to improve himself and find clues on how best to govern philanthropy. Skeptical by nature, Gates saw a world crawling with quacks and frauds, and he enjoyed grilling people with trenchant questions to test their sincerity. Outspoken, uncompromising, he never hesitated to speak his piece to Rockefeller and was a peerless troubleshooter.

Gates believed implicitly in Rockefeller's goodness and wisdom. "If he were placed in a group of say twenty of the greatest men of affairs of today," he once remarked in a speech, "before these giants had been with him for long, the most self-confident, self-assertive of them would be coming to him in private for his counsel."<sup>9</sup> Having known many rich people, Gates was impressed that Rockefeller had no private yachts or railroad cars. He was always quick to defend Rockefeller, sometimes wittily. When a man complained to him that Rockefeller in his Cleveland years cared only for money, Gates retorted, "In heaven's name, what else could he do in that city!"<sup>10</sup> In a typical utterance, Gates said, "The Rockefellers have done incomparably more to permanently enrich the commonwealth than any other family since the founding of the republic."<sup>11</sup>

Gates did not consider Rockefeller totally innocent in business, but he believed that whatever reprehensible deeds he had committed had simply reflected the business morals of his time. Yet he had no firsthand knowledge of the matter, for while he supervised Rockefeller's philanthropic and outside business investments, he was always excluded from anything pertaining to Standard Oil. As Junior said, "The oil companies didn't like him and consequently I was the person who was the liaison."<sup>12</sup> Since Gates entered the scene just as Rockefeller was retiring and was sequestered from his single largest holding, he had the luxury of believing in Rockefeller's innocence by assuming that he had behaved as well at Standard Oil as in his subsequent ventures.

Significantly, Rockefeller surrounded himself in the early 1890s with brand-new men who could defend his past with total sincerity—and total ignorance. By recruiting subordinates who had never worked at Standard Oil, he had a chance for a fresh start, where he could make his behavior, for the first time, as ethical as his rhetoric. Led by Gates, these subordinates guaranteed that the Rockefeller millions were donated or invested scrupulously. Once he had an ex-pastor on the payroll, Rockefeller was necessarily kept on his best behavior, locked into a new moral regimen. Junior's presence at 26 Broadway further ensured that father would behave more ethically than in the past.

As at Standard Oil, Rockefeller encouraged independence, and once he had carefully trained his philanthropic lieutenants, he gave them a wide berth. Gates found his boss patient, kind, and considerate, but realized that Rockefeller's genial midwestern manner and humor were something of a cover. "His usual attitude towards all men was one of deep reserve, concealed beneath commonplaces and humorous anecdotes. He had the art with friends and guests of chatting freely, of calling out others, but of revealing little or nothing of his own innermost thoughts."<sup>13</sup> When Gates went to the oracle for guidance, he sometimes left more mystified than before. As he wrote of Rockefeller, "His deliberation was sometimes extreme; his reluctance to argue and speak out his thoughts fully, his skill in not exposing the slightest surface for attack, his long silences, so that we could not locate even his objections, were sometimes baffling."<sup>14</sup> Rockefeller never offered blame or praise and revealed his opinion of employees only by adding or subtracting to their duties. His psyche was like a set of Chinese boxes: If you penetrated the outer wall, then you faced another wall, then another, ad infinitum.

As Rockefeller moved into retirement, his wealth was accumulating at an astonishing rate. During his tenure at Standard Oil, the trust had usually paid a fixed dividend of 12 percent, reflecting his prudent leadership. With Archbold at the helm, by contrast, the dividends surged, jumping to 31 percent in 1896 and 33 percent in 1897 and 1899. Buoyed by these dividends, the price of Standard Oil shares leaped from 176 in 1896 to a high of 458 three years later. However much Rockefeller deplored this extravagant dividend policy, he was its foremost beneficiary, and it heightened the pressure on him to gear up his philanthropy to handle increasing amounts of money.

With hundreds of appeals pouring in daily from around the world, Rockefeller made Gates promise that he would never forward begging letters to him or reveal his address. While Rockefeller continued to give out hundreds, if not thousands, of individual bequests to needy friends, relatives, and strangers—he sent one upstate cousin a pair of well-worn shoes, another an old suit—he increasingly followed a policy enunciated in an 1889 letter to Gates: "I am more and more disposed to give only through organized institutions."<sup>15</sup> Gates executed this policy of wholesale giving faithfully, dismissing small requests for money with the fatal remark, "This is a retail business."<sup>16</sup>

Sometimes Rockefeller gave Gates glimpses into his inner sadness. One day, Gates remarked to Rockefeller that benevolence was its own reward, that the man who looked for gratitude would die embittered. "His only reply, uttered with deliberation and unwonted emphasis, was, 'DON'T I KNOW THAT?'"<sup>17</sup> Gates saw that while he was always surrounded by people, Rockefeller had few, if any, real friends and was isolated by his wealth. Visiting Rockefeller at a southern hotel around 1910, Gates found him rather lonely and forlorn and suggested he contact some cultivated local men. "Well, Mr. Gates," said Rockefeller, "if you suppose I have not thought about the matter you are mistaken. I have made some experiments. And nearly always the result is the same—along about the ninth hole out comes some proposition, charitable or financial!"<sup>18</sup> Rockefeller experienced more disenchantment with people in charity than in commerce, once telling his son, "I have lent and given people money, and then seen them cross the street so that they would not have to speak to me."<sup>19</sup>

From the time he signed on as chief almoner, Gates knew his life had changed irrevocably. "I now saw myself largely cut off from disinterested friendships and almost of necessity a centre of intrigue and dislike," he wrote in his memoirs.<sup>20</sup> As he watched people scheme and grovel for Rockefeller's fortune, it was hard to preserve his faith in human nature. "If you could be here in this office," he once wrote William Rainey Harper, explaining his own caution, "and see the exhibition of human meanness, and even dishonor, among otherwise respectable men when they come to negotiate with Mr. Rockefeller's wealth, you would appreciate better than you can now how this perhaps unnatural caution has arisen."<sup>21</sup>

A close student of the boss's psychology, Gates was aware of Rockefeller's preferred self-image and played on it effectively. There was a manipulative side to Gates, as shown by a letter he wrote a friend in which he set forth twenty-two fund-raising tips. Tip number six read: "If you find [the prospective donor] big with gift do not rush him too eagerly to the birth. Let him take his time, with gentle management. Make him feel that *he* is *giving* it, not that it is being taken from him with violence." Number seven advised: "Appeal only to the noblest motives. His own mind will suggest to him the lower and selfish ones."<sup>22</sup> One suspects Gates applied some of these pointers to Rockefeller himself, posing all the while as the faithful servant.

Gates had a talent for dressing up proposals to Rockefeller with the right touch of historic drama. He made each gift seem a momentous advance in human civilization and often mimicked Rockefeller's own business rhetoric—talking about educational trusts, for instance—to sell him a program. Gates knew that Rockefeller viewed himself as an instrument of God in business and philanthropy. By striking this note, Gates could always capture his

mentor's attention. Many years later, Gates sent him the following New Year's greeting:

*Certainly no man can survey your marvelous career without feeling that it bears in very high and special degree the marks of a "Plan of God." I remember well how your life has been to yourself a series of great surprises, how vistas altogether unexpected have suddenly opened before your astonished gaze, and now that you have arrived at a point when you can look back over a long course, how often and how deeply must it have impressed itself on your mind that you have been simply an instrument in the hands of the Great Power that is not ourselves. How clear must it now be to you in the retrospect that this Great Unseen Power was guiding you all the time and ever to ends unseen, vaster, more varied, more far reaching than any human wisdom could compass or conceive. If now at the beginning of this new year I may venture to offer you a toast, it would be—John D. Rockefeller, His Life, A Plan of God.<sup>23</sup>*

While Gates would function as a never-ending source of ideas for the philanthropies, it is important to credit Rockefeller's own contribution. The same mind that created the Standard Oil empire was actively engaged in building up his charitable empire. As Gates noted, Rockefeller "came to have hardly less pleasure in the organization of his philanthropy than in the efficiency of his business."<sup>24</sup> In retirement, he actually gave more time to philanthropy than to investments. While Gates often generated ideas, Rockefeller never hesitated to wield his veto power or force Gates to rethink proposals. Gates had to take account of the many things that Rockefeller had ruled off-limits, such as funding social-welfare agencies. He never had infinite freedom to draw up programs and needed to conform to Rockefeller's wishes. His power, if vast, was circumscribed.

Rockefeller developed such a mystique of infallibility that people assumed his touch was no less unerring in his private investments than at Standard Oil. Whenever it was known that he had bought a stock, exultant investors rushed to join him. Sometimes, Rockefeller contributed to his own myth. "It has always been my rule in business to make everything count," he once told an old friend. "To make every cent something. I never go into an enterprise unless I feel sure it is coming out all right."<sup>25</sup>

If he ever set eyes on that windy boast, Frederick T. Gates would have grinned, for he had found Rockefeller's personal finances in a shocking state, run haphazardly without a full-time portfolio manager. The mastermind of Standard Oil had proved to be a passive and easily hoodwinked investor. By 1890, as he banked ten million dollars in annual income, Rockefeller still deferred, with surprising credulity, to advice proffered by supposed friends. He fell particularly under the sway of two fellow congregants from the Fifth Avenue Baptist Church, Colgate Hoyt and Charles Colby. Hoyt often dropped by his house in the morning and accompanied him downtown, touting stocks all the while. Rockefeller reposed implicit faith in these two churchgoers, who induced him to pour millions into ruinous investments in a score of companies. Through their exertions, he acquired an investment empire that he knew solely from misleading figures on a statement. What reconciled Rockefeller to this setup was that he took minority stakes and imagined that his partners were investing equivalent amounts.

As members of the executive committee of the Northern Pacific Railroad when Rockefeller was its major stockholder, Colby and Hoyt avidly pushed investments in timber stands of the Pacific Northwest. They planned to build up the town of Everett, Washington, at the juncture where the Northern Pacific would supposedly establish its major terminus on Puget Sound. As the Great Northern Railroad also neared completion, the whole area was convulsed by a speculative mania. Colby and Hoyt erred, however, in one small but costly matter: The Northern Pacific terminal ended up in Tacoma, not Everett. Meanwhile, blindly following their counsel, Rockefeller had added mines, steel mills, paper mills, railroads, and even a nail factory to his holdings.

Rockefeller's unwonted lack of vigilance owed something to his fragile health during the early 1890s, when he was trying to clear his mind of cares. Sensing that some of his outside investments might not be as sound as advertised, he mentioned to Gates one day that if, on his philanthropic excursions, he happened to be near one of these investments, he might want to scout out the premises. While Rockefeller was already impressed by Gates's resourcefulness, he also knew that with Gates he risked less potential embarrassment than with a professional financial analyst who might broadcast his failures on Wall Street.

Soon after Gates moved to New York in 1891, he was about to embark on a tour of Baptist schools in Alabama when Rockefeller asked if he would inspect an iron furnace he had bought there on an old friend's advice; he said he was perplexed why it had fallen into a receiver's hands. When Gates filed his report, it was instantly clear that he was no courtier serving up syrupy lies to soothe his sovereign. The entire operation, Gates said bluntly, had nothing to do with iron but was a thinly veiled attempt to boom local real estate; many Baptist ministers had been tricked into buying nearby land that was supposed to appreciate because of its proximity to the iron operation. Rockefeller hid his amazement and contended breezily that he had taken this "little flyer" to help an old friend's son learn the iron business. By way of comparison, Rockefeller alluded to his lucrative iron business in Wisconsin, then allegedly yielding \$1,000 per day. A few months later, he sent the intrepid Gates to take a look.

Gates traveled to Wisconsin and with quiet tenacity began asking questions. He found exactly the same fraud as that perpetrated in Alabama: The iron-works were being used to pump up local real estate and auction off lots at inflated prices. The supposed profits were pure moonshine: Rockefeller was actually *losing* about \$1,000 per day. To anyone who knew Rockefeller, the situation seemed inconceivable: He had made large investments without independently verifying the numbers sent by his friends.

When he appeared at Forest Hill to relay the bad news, Gates knew that the boss could not dismiss \$600,000 in mortgage bonds as a "little flyer," and Rockefeller was visibly upset. As Gates recounted the meeting:

*He was deeply agitated and, had I not been able to give him the most positive assurances, would have been incredulous. He kept me with him at Forest Hill until he could get the old friend to his side from Wall Street, who had been mainly instrumental in selling him the bonds. This gentleman denied every one of my allegations, but he could only meet my proofs with protestations and tears of rage and apprehension.<sup>26</sup>*

A few days later, the contrite scoundrel—whether Colby or Hoyt is unclear— returned to Rockefeller, confirmed the truth of Gates's allegations, and agreed to have the mortgage-bond covenants rewritten.

Shaken by this duplicity, Rockefeller sent his sleuth to probe his investment in the San Miguel Consolidated Mines high in the Rocky Mountains. The scheme's promoter had entertained many previous investors who had journeyed westward to tour the site. At once, Gates scented trouble when he quizzed a mining engineer in Denver about the San Miguel properties. "What!" the man shouted. "Do you mean to tell me that John D. Rockefeller has invested money in that Damned Swindle!!"<sup>27</sup> When Gates journeyed to Telluride, he learned that the mines were phantoms and that the company had only abandoned claims.

At this point—it was now late 1892—Gates was still operating at one remove from Rockefeller in a nearby office in the Temple Court; after the San Miguel fiasco, Rockefeller moved him into his office at 26 Broadway. He saw that Gates had a flair for business that surpassed anything he had encountered at Standard Oil. In a stunning display of trust, Rockefeller gave him unrestricted access to his files for all investments outside of Standard Oil. As Gates poked around in this fetid swamp, he was appalled by what he found. "I unearthed some twenty of these sick and dying corporations," he recalled, "every one of which showed a balance sheet in red ink."<sup>28</sup>

As Gates sorted through the failed investments, George Rogers joined the chorus of those urging Rockefeller to institute new oversight procedures for his \$23 million investment portfolio, including \$14 million in railroad securities. Emboldened by Gates's findings, Rogers suggested creation of an executive committee. Gates would handle investments and benevolent matters; Gates's Montclair neighbor Starr Murphy would assume legal responsibilities; and Rogers would take care of office matters, each to be paid \$10,000 a year. As Rogers candidly told his chastened boss, "This will seem to you at first as very high but it will be considerable [*sic*] cheaper than being robbed as you have been and even now you are without exact knowledge as to many of the investments in which you have large sums involved."<sup>29</sup> Pointing out the perils of passive investment, he suggested that Rockefeller assign deputies to oversee these companies.

Beyond the shocking misrepresentation of his investments, Rockefeller had another dispiriting discovery in store: Hoyt and Colby had surreptitiously bailed out of the worthless operations and left him holding the bag, often with a majority stake. Even though he terminated relations with this pair, he could not dispose of their sour investments so easily and thought the most prudent course was to buy total control of the companies and turn them around. Holding practically all the stock of thirteen foundering companies, Rockefeller made Gates president of virtually all of them. Overnight, the young minister who had dreaded poverty was running two railroads plus a far-flung group of mines, timber, and manufacturing concerns. Most of these highly speculative investments never panned out.

As if born to rule business empires instead of saving souls, Gates operated with great swagger and panache. While he jettisoned many money-losing enterprises, he developed great affection for the Everett Timber and Investment Company. Touring this terrain each year in a luxurious private railroad car, he bought up for Rockefeller all the forests in sight, a spree that finally netted 50,000 acres in Washington State and another 40,000 on Vancouver Island. Eventually, these timber tracts fetched five or six times their purchase price, compensating Rockefeller for the losses he had sustained in the Pacific Northwest debacle. Gates himself invested in several of the companies he managed for Rockefeller, and in 1902 he cashed in a tidy \$500,000 profit.

In Gates, Rockefeller had found not merely an able investor but a prodigy. In 1917, asked by B. C. Forbes to name the greatest businessman he had ever encountered, Rockefeller startled readers by skipping Flagler and Archbold—not to mention Henry Ford and Andrew Carnegie—and naming Frederick T. Gates. "He combines business skill and philanthropic aptitude to a higher degree than any other man I have ever known," stated Rockefeller.<sup>30</sup> Enough Puritan guilt resided in Gates's soul that he always stressed his charitable work and deprecated his business exploits. When Adolph Ochs, publisher of *The New York Times*, asked for background information about him in 1912, Gates replied modestly, even evasively, "While I have had intimate relation with Mr. Rockefeller's private business, that is, his private and personal investments, my interests are and always have been rather in his benevolent work than in his business."<sup>31</sup> This would have been news to many on Wall Street who had experienced the temper of this hard-driving, cigar-smoking, flamboyant majordomo of the world's largest private fortune.

Even though he stayed in the background, the press soon detected the power held by the eccentric, shaggy-haired Gates. "In appearance Mr. Gates is not the ordinary type of financier," the *New York Daily Tribune* noted. "Everything about him, from the carelessly brushed iron gray hair and cropped moustache to his feet indicate breezy indifference to what others may think about him."<sup>32</sup> Investment houses trifled with him at their peril, for Gates oversaw a securities portfolio of unprecedented size for a private individual. At a time of thin capital markets, he needed to scrounge to find gilt-edged securities to absorb the Rockefeller millions. As if he were a one-man investment bank, Rockefeller participated, under Gates's supervision, in major stock-and-bond underwriting syndicates alongside the most august Wall Street houses. While it was not unusual in that era for rich individuals to complete syndicates, the sheer scope of Rockefeller's involvement was something novel.

Even in old age, Rockefeller received stock quotes twice daily and could rattle off the precise number of shares he owned in many stocks. He adhered to several hallowed investing rules. Perhaps the most sacred was that Gates not disturb his Standard Oil stock, the bulk of his fortune. As at Standard Oil, Rockefeller insisted upon keeping a cash balance that never dipped below \$10 million. Since he also had a sizable stake in U.S. government bonds, he felt he could play the market with impunity. A born contrarian, Rockefeller insisted upon buying in declining markets and selling in rising ones. When accumulating a position, he bought stocks each time they declined an eighth of a point; when unwinding a position, he sold each time the stock rose an eighth of a point—a technique that gave him an average over an extended period. Having twice been sued by people for offering incorrect market advice, he refrained from offering stock tips. There was also some genuine humility at work, for Rockefeller admitted that he had no "prophetic vision as would make me try to mislead anybody else . . . by one of my miserable guesses."<sup>33</sup>

Since his aides superintended a royal treasury of securities, he had to implement special security precautions. He laid down an ironclad rule that no employee could invest in stocks or bonds of any company in which he held a major stake, and a minimum of two people had to be present whenever the safe housing his securities was opened. Rockefeller's subordinates seemed more jittery than their phlegmatic boss about dealing with such stupendous sums. Starr Murphy recalled an occasion when the boss asked him and a colleague to bring \$60 million in securities to his Pocantico estate for his personal inspection. With no small dread, the two men drove up to Westchester, totally unguarded. Rockefeller did not show any anxiety about the

absence of security and only at the end alluded to the situation by remarking, with deadpan face and humorous drawl, “I suppose that you gentlemen will return to New York together.”<sup>34</sup>

Efforts to manipulate Rockefeller often backfired after the Colby and Hoyt affair. In 1910, for instance, Rockefeller was vacationing in Augusta, Georgia, when he received a visit in his hotel suite from Henry Clay Frick, who solemnly advised him to buy 50,000 shares of Reading Railroad stock. The moment Frick left, Rockefeller got on the phone and issued orders to liquidate his block of 47,500 shares; he had the satisfaction of selling the final 2,500 shares at the stock’s peak.

Rockefeller grappled with the classic dilemma faced by all large investors: how to buy stocks without pumping them up or sell without dragging them down. As his fame spread, his market moves could set off frenzied stampedes of traders. To forestall this, Rockefeller employed a double set of brokers: a primary broker parceled out orders among dozens of secondary brokers who were ignorant of his identity, thus masking his steps behind a maze of intermediaries. For a long time, he paid double commissions, before he worked out a single-commission arrangement with a broker named Paul D. Langdon. On *finde-siècle* Wall Street, stock pools were both legal and vogueish, and Rockefeller had no ethical qualms about participating in them.

Entering the autumnal phase of his life, Rockefeller preferred sure, steady gains to speculative killings. When one promoter tried to peddle some gold-mining shares, Gates cut him off short. “If you were to say that the vein was pure gold, 24 karats fine, broad, easily workable, and close to a railway, to be had for a song, I doubt if Mr. Rockefeller’s attention could be attracted. . . . He has come to a time in life and circumstances in fortune when these things no longer attract his cupidity.”<sup>35</sup> Rockefeller seldom responded to the countless inventors who trooped to his office hoping to sell patents. It was easier to lend large sums, backed by first-class securities as collateral, than to have investments dispersed among dozens of enterprises. For all his fabled rapacity, Rockefeller was a forgiving lender and, by all accounts, lenient to a fault. “Never have I known Mr. Rockefeller to call a private loan, foreclose a private mortgage, or oppress a debtor,” complained Gates.<sup>36</sup> Another investment adviser, Henry E. Cooper, concurred: “He was never too hard on people in business; he was too easy.”<sup>37</sup>

To finance sporadic stock-market forays, Rockefeller borrowed huge sums from banks, up to fifteen or twenty million at a time, pledging his government bonds as collateral. This was all a trifle confusing for Junior, who continued to take his father’s straitlaced pronouncements against speculative investing at face value. As he moved into middle age, the son even took to lecturing his wayward father, chiding him with his own rhetoric. On the eve of World War I, when Senior’s borrowings swelled to nearly \$10 million, Junior reminded him of how he had “frequently given utterance to my belief, that you should never be a borrower, but always long of cash.”<sup>38</sup>

For a long time, Rockefeller resisted efforts to professionalize his investment team, and Gates soldiered on as best he could. In 1897, Charles O. Heydt—later Rockefeller’s expert on real-estate matters—joined the staff, followed a few years later by Bertram Cutler, who helped manage the family investments for the next fifty years. Even with this team in place, the investment operation was still slipshod, and in 1907 Gates told Rockefeller, “I have long thought that it would prove helpful if you could have a man in the office who had before him at all times every day the complete list of your investments and whose business it is to familiarize himself intimately with every one of them—to have his finger, so to speak, on the pulse of every one of them all the time.”<sup>39</sup> The following year, Rockefeller finally capitulated and formed a four-member committee, including Gates and Junior, to manage his money.

As with the Rockefeller philanthropies, Gates operated tentatively at first in the wolfish world of Wall Street but was soon very much master of the situation. Before long, he confidently conveyed to Rockefeller his scathing opinions of such globe-straddling moguls as Andrew Carnegie and J. Pierpont Morgan. At the time, the world of high finance revolved around a spirited rivalry between Morgan and Jacob Schiff of Kuhn, Loeb. Convinced that Rockefeller was already controversial enough, Gates tried, whenever possible, to avoid clashes between these two financiers, and he balked at joining boardroom revolts, stock-market squeezes, and other activities that might bring Rockefeller into any further disrepute.

Famished for blue-chip securities, Gates clamored for inclusion in both J. P. Morgan and Company *and* Kuhn, Loeb syndicates, but always believed that he got superior treatment from Kuhn, Loeb. Under the aegis of this house, Rockefeller swallowed huge chunks of railroad issues, including giant stakes in the Southern Pacific, the Union Pacific, and the Pennsylvania Railroads. He also took a large share in loans floated for the Imperial Japanese government in 1904–1905 during the Russo-Japanese War and for the Chinese government in 1911. He contributed to Kuhn, Loeb’s consolidation of the Chicago meatpackers, led by Armour and Swift, helping to foster another trust. Constantly on the prowl for good securities, he sometimes bought from Kuhn, Loeb just to maintain harmonious relations.

Gates and his minions smarted at the high-handed treatment they received from J. P. Morgan and Company, where they were routinely assigned small portions of mediocre issues—curious treatment for the world’s richest investor. In the early 1900s, Rockefeller found himself with disconcerting frequency involved in Morgan’s biggest blunders, including the Chicago Street Railway that he financed for the magnate Charles Yerkes and the International Mercantile Marine, Morgan’s abortive effort to forge a North Atlantic shipping cartel. For Rockefeller, this was not happenstance but reflected Morgan’s settled antipathy. Bruised by these bad investments, Rockefeller told his son in 1911, “In future, when investments are offered us by this house, we will be of one mind, I think, in accepting nothing which we do not all agree is very desirable for us to have.”<sup>40</sup> After J. P. Morgan, Sr., died in 1913, Rockefeller told his advisers to keep up cordial relations with the Morgan bank while tartly reminding them that “we have had sufficient experience with the House of Morgan & Company in the role of ‘pack horses’ for their poor investments.”<sup>41</sup>

In spite of his phalanx of able advisers, Rockefeller had a very uneven record as an investor. Among his triumphs, he extended a six-million-dollar loan to the fledgling General Motors in 1906—about \$98 million today—taking notes for his cash. When the notes were paid off, Rockefeller took payment in General Motors shares, which then obligingly soared from 200 to 1,500. He also fared well as the premier investor in Consolidation Coal and the B&O Railroad. Yet Rockefeller could stumble abysmally, as evidenced by his mystifying relationship with George Gould. When Jay Gould, who had memorably looted the Erie Railroad, died in late 1892, leaving an estate of more than \$100 million, his twenty-eight-year-old spendthrift son George inherited his investments. He proved an unlikely business partner for Rockefeller. Where Rockefeller frowned upon the expense of private railroad cars, George Gould owned an entire train and savored the patrician pleasures of fencing, hunting, yachting, and polo. The New York tabloids

also delighted in reporting upon his racy relations with women. Whatever his misgivings about George’s philandering, Rockefeller was attracted by the Missouri Pacific and other western railroads that Gould wanted to weld into a transcontinental empire. In 1902, Rockefeller took giant portions of a Missouri Pacific stock offering, and before long he had buried \$40 million in this graveyard, as much as George Gould himself had.

Troubles soon developed. In 1906, irate over Gould’s profligate spending and failure to consult him, Rockefeller had his son withdraw from the Missouri Pacific board. By 1909, Rockefeller felt so abominably treated by Gould that he refused further cooperation unless his representatives controlled the board. As the price of rescuing the Missouri Pacific, Jacob Schiff of Kuhn, Loeb likewise insisted upon heavy board representation. When Gould finally resigned the presidency, he installed a crony in his stead, leading Gates to declare it high time to terminate relations with “the mad failed Gould.”<sup>42</sup> In 1912, Rockefeller unloaded his holdings in the Missouri Pacific stock, ending the misadventure.

Starting in the late 1890s, newspapers published sensational accounts of a shadowy cabal known on Wall Street as the “Standard Oil Crowd.” As diarist Henry Clews recorded, “A new order had come, due to the most powerful influence that had ever manifested itself in Wall Street. This influence was very largely composed of the Standard Oil combination, who introduced in their Wall Street operations the same quiet, unostentatious, but resistless measures that they had always employed in the conduct of their corporate affairs.”<sup>43</sup> It was popularly assumed that John D. Rockefeller masterminded these diabolical exploits and was determined to digest Wall Street itself. “It has been said that I control all the banks, all the trust companies, all the insurance companies, even all the railroads in the United States,” a chagrined Rockefeller told one reporter in 1906. “Will you believe me when I say that I do not own a controlling interest in any bank, trust company or insurance company?”<sup>44</sup>

Rockefeller dabbled in stocks more than he admitted, but he was largely a passive investor and remained as leery of Wall Street as any cracker-barrel Populist. Once pressed for investment advice, he retorted, “I suppose if I were to give advice it would be to keep out of Wall Street.”<sup>45</sup> When he bought a seat on the New York Stock Exchange in 1883, he made an obligatory appearance before the admissions committee, then avoided the exchange for the next fiftyfour years. He proudly pointed out that, during his tenure, Standard Oil was never listed on the exchange and that management’s attention was “directed to the administration of the business rather than to the stock gambling.”<sup>46</sup> Although he never issued a public refutation, Rockefeller played no part in the Standard Oil crowd and cringed at the exploits of its three mainstays: Henry H. Rogers, James Stillman, and his own brother William. Rogers and William paid for their speculations with Standard Oil checks, a practice that always riled John D.

While John always professed warm friendship for his brother, their values had radically diverged over the years as William became a typical grandee of the Gilded Age and plunged lustily into a world of fashionable clubs and resorts. Having sold much of his Standard Oil stock to his brother, William was not nearly as rich as John, but he was still one of the six major recipients of Standard Oil stock and was often listed among the ten richest Americans. A connoisseur of the good life, he loved cocktails, gambling, fast-trotting horses, hunting, fishing, opera, theater, and yachts. His Fifth Avenue mansion faced Alva Vanderbilt’s French limestone château, and he frequented her costume balls. His weekend house, Rockwood Hall, a vast pile of towers and turrets with 204 rooms and gardens landscaped by Frederick Law Olmsted, loomed over the Hudson River. He also had a rugged Adirondack estate of several thousand acres. In 1888, along with such moguls as J. P. Morgan, William K. Vanderbilt, and Cyrus McCormick, William founded the Jekyll Island Club—the posh resort of the “One Hundred Millionaires”—on an island off the Georgia coast that soon boasted roads with names such as Morgan Road and Rockefeller Path. In his later years, William traded in his Baptist upbringing for a more epicurean life. “I used to be very much interested in the church,” he told a friend in later years, “but I haven’t attended for many a day.”<sup>47</sup> Unlike John, William gave little to charity and turned a deaf ear to John’s entreaties to contribute to the University of Chicago. At one point, when pressing William to help build a church, John needled him by saying: “Paintings are good, this would be better.”<sup>48</sup> William was more jaundiced than John was about the motives of people who solicited his money.

It was in their stock-market operations that the two brothers differed most— so much so that John stayed aloof from enterprises in which William was involved. In declining a proposed investment, John simply told his financial staff, “No, that is William’s,” and that ended all discussion.<sup>49</sup> As a denizen of Wall Street, William was often found in his downtown office, puffing on a cigar and glancing at a stock ticker by the window. Besides being president of Standard Oil of New York, he was a director of forty companies, including railroads, banks, and copper mines, plus steamship, gas, and water companies. What irked John was that William engaged in stock promotions and market raids and other activities that he equated with gambling and manipulation. It might have been friction over this issue that caused their relationship to cool in the late 1890s. In 1897, John omitted William’s name alone from a list of top Standard Oil executives slated to receive large salary increases, prompting this plaintive protest from Flagler:

*I wish you would include Will—from a purely business standpoint. I think he is worth as much as the younger of “the three others” and I doubt if you realize what a reflection upon him it would seem to be left out. The last day of this month will round out thirty years since I joined you and Will in business. Do not let us at this late day do anything that will have the appearance even of unkindness. I think I know Will’s personal feeling for you better than you do—it is far more kindly than you imagine.*<sup>50</sup>

John held back from William’s stock-market deals in part because he associated them with James Stillman, who on the strength of his Standard Oil connections and his friendship with William had converted National City Bank into New York’s largest bank. “I like William,” said Stillman, a darkly elegant, taciturn man, “because we don’t have to talk. Often we sit fifteen minutes in silence before one of us breaks it!”<sup>51</sup> They were an oddly matched pair, William good-natured and easygoing, Stillman an icy individual who played his cards close to the vest. One of Stillman’s descendants left this description of him: “Stern, brooding, forever silent except when dropping sardonic remarks, he was known on Wall Street as ‘the man with the iron mask.’”<sup>52</sup> At one point, Stillman feuded with his wife and banished her forever from the house, forbidding his five children from mentioning her name. The rapport between James Stillman and William Rockefeller was transferred to their children. Stillman’s daughters, Elsie and Isabel, married William’s sons, William G. and Percy, breeding a line of Stillman Rockefellers who would be central figures in the subsequent history of National City Bank, today’s Citicorp.

Many contemporary critics assumed that John D. formed an investing triumvirate with his brother and Stillman; in fact, he had serious reservations about Stillman’s character and regretted his friendship with William. Evidently, Stillman repaid the compliment. One day, he dropped by 26 Broadway

to visit William, strolled over to Junior's desk, and proceeded to make derogatory comments about Senior. At once, Junior rose stiffly to his feet, spluttering, "Mr. Stillman, you can say those things to my father but you can't say them to his son. Good day."<sup>53</sup>

In spite of their uneasy relationship, Stillman invited Junior to become a National City Bank director in 1901. Junior was tempted to accept but feared that Stillman's rival J. P. Morgan might retaliate by excluding his father from underwriting syndicates. Senior was more concerned that the appointment might lend credence to the bothersome canard that he held a major stake in National City Bank. If Junior took the position, Senior warned him, it "might seem to indicate a closer relation in that quarter than really exists, or would be wise for us to publish to the world."<sup>54</sup> For once defying his father's wishes, Junior joined the National City Bank board; Senior, relenting, bought ten thousand shares of the bank's stock. As it turned out, Junior resigned from the bank board the following year, finding some of its practices questionable.

The significance of Senior's stake in National City Bank should not be overstated. A 1906 statement of his holdings shows that he had \$415,000 invested in the bank as opposed to \$375,000 in the First National Bank—controlled by Morgan's crony George F. Baker—while his largest bank holding was \$1.4 million in New York Trust, dominated by the Harkness family. He also bought a substantial stake in Bankers Trust when it was started in 1903. In general, Rockefeller deliberately avoided National City Bank and the Standard Oil crowd, but he chose never to make that public and thought it unconscionably craven that William, Stillman, and Henry Rogers failed to disabuse the press. Once asked privately about Stillman's bank, he replied dryly, "It is called, I am told, the Rockefeller institution. But I don't control it. I have perhaps \$300,000 of its stock, and its capital is \$200,000,000. . . . I have never been in the building in my life. Why, I declare I don't even know where it is located."<sup>55</sup>

Rockefeller did acquire a major interest in one bank. After the Armstrong investigation of 1905 exposed massive double-dealing between insurance companies and their bankers, reform legislation was enacted in 1911 that forced the Equitable Life Assurance Company to spin off its subsidiary, the Equitable Trust Company. Seizing this chance, Rockefeller, George Gould, and Kuhn, Loeb took control, with Rockefeller the principal shareholder. Rockefeller hoped to participate in the bank's lucrative financial operations and soon urged all companies within the Standard Oil universe to switch their accounts to the bank. Profiting from the Rockefeller tie, the Equitable Trust became within a decade America's eighth-largest bank. The move was fraught with significance for the Rockefellers, for the bank was to merge with the Chase Bank following the 1929 crash; the resulting institution would be the fortress of Rockefeller-family finance. If the descendants of William Rockefeller were identified with National City, the progeny of John D. were always associated with Chase.

Of the three principals in the Standard Oil crowd—Rogers, Stillman, and William Rockefeller—it was Henry H. Rogers who most entranced the public. In the pantheon of Standard directors, nobody save John D. himself achieved wider fame. There was something lithe and lethal, charming and fierce, about Rogers that made him a magnetic figure even to those he repelled. At Standard Oil, they affectionately dubbed him the "Savage Old Tiger," while Wall Street, taking his initials, christened him Hell Hound Rogers. He was a handsome and athletic man, with a theatrical mustache, a sharp gaze, and a swashbuckling aura.

Rogers had a chameleon personality. He could be sensitive and generous one moment, a pitiless foe the next. In Manhattan clubs and drawing rooms, he charmed companions, relating hilarious stories and playing a wicked game of poker. He was also very charitable: He helped Colonel Edwin Drake's impoverished widow and also built a school, library, church, parish house, and masonic hall in his hometown of Fairhaven, Massachusetts. "He looked at you and he owned you," said one Standard Oil colleague, fascinated by his kaleidoscopic moods. "He was affable unless you tramped on his little toe. He was a man of the fiercest likes and dislikes that I ever knew in the business."<sup>56</sup> "His expression could transform itself totally while he blinked his eyes," a reporter wrote in the *Evening Post*. "His voice could travel through the scale of vindictiveness, indifference, politeness, affability and friendliness in a single sentence."<sup>57</sup>

Rogers's journey from an impecunious boyhood to the summit of Wall Street affluence was startling. A sea captain's son, he spent his adolescence clerking in a grocery store, hawking newspapers, and working on a railroad before setting off with a friend to operate a small refinery outside Oil City. Through a mutual friend, he was introduced to Charles Pratt, who bought his operation and ushered him into the Standard Oil fold. Had he stuck to oil, Rogers would have fared far better in his relations with Rockefeller, who thought he divided both his time and loyalty. From his elegant mahogany office, decorated with small bronze bulls and bears, Rogers hatched deals by the dozen, forcing reporters to work full-time to track his machinations. At one point, he became the veritable czar of Staten Island, controlling its trolleys, railroads, ferries, and electric and gas companies. In 1884, he and William Rockefeller formed the Consolidated Gas Company to provide gas to Brooklyn, and he also vied with J. Edward Addicks for control of Boston gas.

With his executive flair, Rogers thought he was the ideal candidate to succeed Rockefeller and he was elevated to vice president of the trust in 1890. He therefore bristled when Archbold was tapped for the top spot. The decision was partly a question of style. Rockefeller was irked by Rogers's gambling and profanity, his strutting in public and mingling with high society. Rockefeller also favored Archbold because he was wedded to Standard Oil business, whereas Rogers was often distracted by other interests. Rogers sometimes bullied Standard Oil subordinates to starve his gas competitors of needed oil, even if this hurt Standard profits—a cardinal sin in Rockefeller's view.

The flash point in the feud between Rockefeller and Rogers came in 1899 when James Stillman, William Rockefeller, and Rogers acquired secret control of Anaconda Copper of Butte, Montana, a mining venture formerly owned by Senator George Hearst. They made the purchase with a \$39 million loan from National City Bank. They then turned around, restyled the new holding company Amalgamated Copper, and fobbed it off on a gullible public for \$75 million, retiring the \$39 million loan and pocketing a \$36 million profit. Rockefeller was incensed by the issuance of so much watered stock, which gave him a chance to feel self-righteous when his own virtue was under attack. The new company was floated by Stillman and National City Bank, and both William and Rogers exploited their Standard Oil connections to stoke a speculative fever.

To execute this deal, Rogers made the mistake of inviting a sharp-eyed Boston stockbroker named Thomas W. Lawson into the project. Starting in July 1904, Lawson published a tell-all account in *Everybody's* magazine that was later collected into a classic volume entitled *Frenzied Finance*. The most melodramatic potboiler in American financial history, the book opened with this histrionic dedication: "TO PENITENCE: that those whose devilry is

exposed within its pages may see in a true light the wrongs they have wrought—and repent.”<sup>58</sup> Describing himself as a mere “neophyte in crime,” Lawson gave his exposé a confessional note: “I have unwittingly been made the instrument by which thousands upon thousands of investors in America and Europe have been plundered.”<sup>59</sup>

The gist of his indictment was that the public paid two-thirds of the purchase price for Amalgamated Copper while Rogers and his comrades took two-thirds of the stock. At the time, Lawson noted, Standard Oil was considered “the greatest power in the land,” and its supposed involvement had stimulated a buying mania.<sup>60</sup> At the subscription deadline on May 4, 1899, mobs had formed outside National City Bank, and four burly policemen had to shut the doors against these disappointed investors. With the offering five times oversubscribed, Rogers handed out preferred allotments to favored politicians. Rogers and William Rockefeller had lured investors with the promise of their own involvement, but they dumped stock soon after it was issued. Lawson’s character sketches were as memorable as his revelations about the syndicate’s methods. Oddly, he expressed affection for William Rockefeller, whom he portrayed as solid, laconic, and far more trustworthy than Rogers. In Henry Rogers, he found his true protagonist, a mutable man of violent extremes, an actor of genius who got lost in the many roles he shuffled:

*Yet away from the intoxicating spell of dollar-making this remarkable man is one of the most charming and lovable human beings I have ever encountered, a man whom any man or woman would be proud to have for a brother. . . . Once he passes under the baleful influence of “The Machine,” however, he becomes a relentless, ravenous creature, pitiless as a shark, knowing no law of God or man in the execution of his purpose.*<sup>61</sup>

By liberally splashing the names *Rockefeller* and *Standard Oil* across his pages, Lawson made it seem as if John D. had formed a conspiratorial trio with Rogers and William. At one point, he said more truthfully, “It was the first venture of size these two strong wheelmen [Rogers and William] of ‘Standard Oil’ had undertaken without the cooperation of John D. Rockefeller, and it appeared that he was considerably worked up over the public hubbub, and so opposed to the whole Amalgamated affair that nothing short of a great success could justify his subordinates’ temerity.”<sup>62</sup> In a footnote, Lawson further conceded that Rockefeller never put a dime into the Amalgamated flotation. Nevertheless, the general public came away with the impression that John D. was pulling the strings.

At one point, Lawson quoted Rogers’s views on the merits of cartels versus competition: “No man has done his business properly who has missed a single dollar he could have secured in the doing of it. . . . It is one of the first principles Mr. Rockefeller taught me; it is one he has inculcated in every ‘Standard Oil’ man, until today it is a religion with us all.”<sup>63</sup> While Rogers was talking in general terms, it again left the impression that John D. lurked somewhere behind the copper trust.

Had he not been unfairly implicated, Rockefeller might have enjoyed the rebuke delivered to Rogers. When the Lawson series began, Junior rushed him a copy, declaring, “I think you will be well repaid for reading this article, although it seems to be written in a bitter, vituperative, sensational manner.”<sup>64</sup> Any such satisfaction, however, paled before the sense that he had been unjustly slandered. “They said I owned copper stock—that Boston man said it—when as a matter of fact it belonged to my partners and I had nothing to do with it,” he was still seething years later. “It was not pleasant to sit still and take all the abuse and not hear one word of explanation from them.”<sup>65</sup> Rockefeller suffered in silence, knowing that if he spoke up he would have to repudiate his brother. After the Lawson series, John D. and Rogers saw each other only twice during the next five years.

In early 1907, Rockefeller took revenge against Rogers at a meeting of Standard Oil’s board of directors. After investing millions of his own money in the Virginia Railway, a coal-carrying railroad in Virginia, Rogers could no longer carry the debt and sought relief from Standard Oil. Spying his chance to cut Rogers down to size, Rockefeller told his partners, “Gentlemen, we should not as an organization become involved in other corporations or side issues. We are making money and success as an oil corporation and we should confine our efforts to Standard alone.” When a vote was taken, Rockefeller prevailed, and Rogers grew so enraged that he slammed his fist on the table, threatening to sell every share of Standard Oil stock he owned. To this, Rockefeller placidly replied, “What is your price?” When Rogers named it, Rockefeller rejoined, “I will meet you here with a certified check tomorrow at 10.” The next day, in an incalculable blunder, Rogers handed over his block of Standard Oil stock to Rockefeller, surrendering in a moment of pique a vast fortune in future dividends and appreciation.<sup>66</sup> As we shall see shortly, Rockefeller might have had more than the Lawson series on his mind, for he thought that Rogers had played a treacherous trick on him by meeting with Ida Tarbell.

Posterity has received another portrait of Henry H. Rogers, and, given the power of the pen that drew it, it has been an imperishable one. Something of a literary man, Rogers had long admired Mark Twain and read his books aloud to his children. “If I ever meet that man,” he once commented, “I’d like to do something for him.”<sup>67</sup> He thus responded with alacrity in 1893 when Twain’s friend Clarence Rice asked if Rogers would meet the author at the Murray Hill Hotel to discuss the bankruptcy of Twain’s publishing house, which was staggering under heavy debts. The two men, who had met on a yacht two years before, were both legendary raconteurs and wits and developed an instant rapport. Rogers decided to mount a rescue effort and the next morning wrote out a check for eight thousand dollars. Taking Twain’s finances in hand, he kept Twain’s creditors at bay and rallied his spirits, inviting him along with Archbold to prizefights at the New York Athletic Club. With canny foresight, Rogers insisted that Twain retain all his copyrights, “a service which saved me and my family from want and assured us permanent comfort and prosperity,” Twain said later. <sup>68</sup> Under Rogers’s tutelage, Twain invested his royalties wisely and paid off his debts. Awash with gratitude, Twain refused to publish Henry Demarest Lloyd’s *Wealth Against Commonwealth*.

A friend of infinite tact, Rogers endeared himself to Twain as much by the manner as the substance of what he did. “By no sign, no hint, no word did he ever betray any consciousness that I was under obligations to him,” Twain wrote. “I have never been so great as that, and I have not known another who was.”<sup>69</sup> Their friendship survived Twain’s financial crisis, and Rogers later negotiated lucrative book contracts for Twain, who became a frequent guest aboard Rogers’s steam yacht, the *Kanawha*. (During one cruise, Twain composed his sketch “The Loaves and the Fishes,” in which he argued that the true miracle of the biblical story was not the multiplication of bread and fishes but that twelve disciples served five thousand people and lived to tell the tale.) When Rogers was devastated by Lawson’s vitriolic portrait in *Frenzied Finance*, Twain supplied favorable anecdotes about him for a profile in *The World’s Work*, a magazine published by Frank Doubleday. For Rogers, Twain reserved his highest encomium: “He is not only the best friend I

have ever had, but is the best man I have known.”<sup>70</sup>

A frequent visitor to 26 Broadway, Twain loved to smoke cigars, read, and lounge on the sofa in Rogers’s office while his friend entertained a steady stream of visitors. He had no concerns about Rogers’s reputation. “He’s a pirate all right,” Twain said, “but he owns up to it and enjoys being a pirate. That’s the reason I like him.”<sup>71</sup> For a time, Twain turned 26 Broadway into his downtown clubhouse and sometimes lunched with Junior. “I got down here to the Standard Oil in time for late luncheon with young Rockefeller—it is the best homemade table in the North,” Twain once told his wife.<sup>72</sup> He formed a favorable opinion of Junior as “a plain, simple, earnest, sincere, honest, well-meaning, commonplace person, destitute of originality or any suggestion of it.”<sup>73</sup> A defender to the end, Twain later blamed the muckrakers and Teddy Roosevelt for Standard Oil’s infamy. That the trust had scarcely had a strike in more than four decades proved to him that “the Standard Oil chiefs cannot be altogether bad or they would oppress their sixty-five thousand employees from habit and instinct, if they are so constituted that it is instinctive with them to oppress everybody else.”<sup>74</sup>

Another perceptive author developed intense affection for Rogers. In 1896, the sixteen-year-old Helen Keller, who was blind and deaf, met him and Twain at a gathering to raise money for her future education. Even before the meeting, Twain laid the groundwork, telling Mrs. Rogers, “It won’t do for America to allow this marvelous child to retire from her studies because of poverty.”<sup>75</sup> Rogers paid for much of Helen Keller’s education at Radcliffe College, which she gratefully acknowledged. “That I haven’t missed my small part of usefulness in the world, I owe to Mr. Clemens and Mr. Rogers,” she wrote.<sup>76</sup> After graduating cum laude, Helen stayed in touch with Rogers and poignantly dedicated her book *The World I Live In* to “My Dear Friend of Many Years.”<sup>77</sup> Before he died, Rogers established an annuity that gave her lifelong security. Helen Keller’s teacher, Anne Sullivan, later revealed that “Mr. Rockefeller [ Junior] and his father have been interested in Helen most of her life.”<sup>78</sup> Unlike the help from Rogers, the Rockefeller money was given anonymously.

In the 1890s, Rockefeller stumbled, almost by accident, into owning most of the iron ore on the Mesabi Range, the last business project that he executed on a monumental scale.

This legendary investment began as another blunder bequeathed by his bumbling former advisers, Colby and Hoyt. When Gates first examined the iron-ore properties the two had bought in Cuba, Michigan, and Wisconsin, he thought they were worthless holes. Colby and Hoyt had, however, unearthed one promising entity: the Minnesota Iron Company. Gates was impressed on a westward journey by the potential of the Mesabi Range, which contained a broad band of iron ore laid across a 120-mile strip in northern Minnesota. Though it held out hope of being the richest such vein ever found in North America, its commercial utility had not been demonstrated. Unlike hard rock dug from underground mines and fed into blast furnaces, the Mesabi ore was fine, powdery stuff that either clogged furnaces or blew out their chimneys, scattering dust across the countryside. On the other hand, it lay close to the surface and in such abundance that it could be scooped out by steam shovels at a fraction of the expense of underground mines.

Among the pioneers in Mesabi ore were the backwoods Merritt family. These so-called seven men of iron—four brothers and three nephews—borrowed recklessly, snapped up tremendous tracts of land, then launched construction of a railroad to carry the ore to Lake Superior. When the 1893 panic savaged iron prices, however, they faced a severe cash squeeze. The atmosphere in Duluth grew incendiary as workers with drawn pistols forced their way into the office of the Merritts’ railroad to demand payment of overdue wages.

In rescuing the Merritts, Rockefeller reenacted his old pattern of swooping down, fortified with cash, on distressed properties and seizing a commanding position. As with the malodorous Lima oil, he wagered that the Mesabi ore would someday be of value—even as Andrew Carnegie and his experts gleefully scoffed at this preposterous idea. As Carnegie’s right-hand man, Charles Schwab, said of these naysayers, “They couldn’t understand how [Rockefeller], without knowledge of the iron business, could invest money in ores that were useless—at least for a long time to come.”<sup>79</sup> To which Rockefeller retorted tersely, “It was a surprise to me that the great iron and steel manufacturers did not place what seemed to be an adequate value on these mines.”<sup>80</sup> He believed that, like the early days in oil, the steel industry was on the verge of overproduction and would soon fall prey to suicidal competition unless stabilized by strong owners. An expert in the strategic importance of transportation, he avidly eyed the extensive rail and dock facilities controlled by the Merritts.

When Rockefeller advanced money to the Merritts in the panic summer of 1893, he was one of the few people who could have saved them. Naively, he expected to disburse a modest \$100,000, and he never imagined that the Mesabi project would tax his colossal resources and consume eight years of his time. In exchange for his investment, Rockefeller negotiated a deal with the Merritts to set up a holding company, the Lake Superior Consolidated Iron Mines, which would combine the Merritts’ rail and mining assets and the rather mediocre mining properties cobbled together by Colby and Hoyt. The idea was that the Merritts would run the company and employ Rockefeller’s cash infusion to finish the stalled railroad. At first, Rockefeller owned only a fifth of the stock, but he exercised final control through his first mortgage bonds, which enjoyed a lien on the entire company in the event of a default.

Given their intertwined fates, it seems odd that Rockefeller met the head of the Minnesota family, Leonidas Merritt, on only a single occasion and then briefly in June 1893. Gates tried to shield Rockefeller from such contacts, but Merritt warmly insisted that he wished to shake his savior’s hand. When they met at 26 Broadway, the meeting lasted five minutes, and Rockefeller was the pattern of affability. He touted the virtues of the Mesabi venture then turned to the Minnesota weather. After a few more pleasantries, he politely excused himself and never saw any of the Merritts again. Afterward, Gates made it clear that his boss would now withdraw behind his customary screen. “In talking to me,” he told Leonidas Merritt, “you are talking to Mr. Rockefeller.”<sup>81</sup> Even by his own extremely reclusive standards, Rockefeller was remarkably aloof during his eight-year fling in the iron business. Though he became chief landlord of the Mesabi Range, he set foot on its slopes only once and that was long after he had disposed of his properties.

In the autumn, Rockefeller’s goodwill toward the Merritts ebbed. As their notes matured, they frantically pressed Gates for cash, and Rockefeller reluctantly obliged them with loans. Gates matured as a businessman during this crisis, and Rockefeller bestowed exceptional authority on him. When Gates visited Duluth in September, Rockefeller confided to Cettie, “[Gates] reports progress daily, and has one hundred thousand dollars in his pocket to use at his discretion.”<sup>82</sup> By October, the initial loan had burgeoned to nearly \$2 million, with no guarantee that the Mesabi ore would ever

demonstrate commercial value. It all seemed a gamble gone hideously wrong. Pacing the Forest Hill porches, Rockefeller later remembered the harrowing, sometimes daily emergencies forced upon him by the uncouth Merritts, who kept their securities stuffed in their pockets: “I had to loan my personal securities to raise money, and finally we were compelled to supply a great deal of actual cash, and to get it we were obliged to go into the then greatly upset money market and buy currency at a high premium and ship west by express to pay the laborers and the railroad and to keep them alive.”<sup>83</sup>

In early 1894, still burdened by debt, the Merritts were forced to offer Rockefeller ninety thousand shares of Consolidated stock at ten dollars a share. As with Standard Oil, Rockefeller kept adding to his Consolidated holdings, the ten-dollar price being on a par with his other purchases at the time; the Merritts, though, vociferously claimed they had been swindled. A year later, they had to forfeit to Rockefeller an option on another 55,000 shares of Consolidated stock, surrendering to him complete control of the company. With fullthroated passion, Gates urged Rockefeller to expand his investment. “It is, in my opinion, the opportunity of a lifetime, one of those opportunities, the seizing or failing to seize, which marks the difference between success and failure in life.”<sup>84</sup>

During the next few years, as steelmakers found ways to adapt their furnaces to the bargain-priced Mesabi ore, Consolidated stock rose to stratospheric heights. In a paroxysm of frustrated rage, the Merritts demonized the man they had earlier heralded as their savior. In a rancorous suit filed against Rockefeller in federal circuit court in Duluth, they portrayed themselves as innocent lumberjacks fleeced by the eastern mogul. Fearing a biased local jury, Rockefeller retained a Minnesota newspaperman to counteract local hostility toward him and even stepped up his Baptist-missionary donations in the state. As Rockefeller feared, the Duluth jury reached a verdict in favor of the Merritts, though it was overturned on appeal. The whole feud was finally settled out of court: Rockefeller paid \$525,000 to the Merritts, who publicly retracted their charges. Of this settlement, Rockefeller commented sarcastically, “We settled, paid money, rather than submit to larger robbery by the twelve just and good men, as we could not get to a higher court.”<sup>85</sup> Stung by the controversy, Gates was still defending his behavior almost twenty years later in a short polemical pamphlet, *The Truth About Mr. Rockefeller and the Merritts*, which he mailed out gratis to ten thousand people.

While Rockefeller and Gates were irked by the Merritts’ ingratitude, they were not entirely blameless. The Merritts alleged that Rockefeller had inflated the value of the mining properties he contributed to Consolidated, a charge that seems substantiated by Gates’s own papers. In early 1893, he had written two letters to Frank Rockefeller, expressing shock at the high prices Colby and Hoyt had paid for the mines. He summed up their value as follows: “Whatever induced Colby Hoyt & Co. to form syndicates to pay such enormous figures for these worthless properties, I cannot understand. I mean to keep pegging along at it from time to time until the whole thing comes out.”<sup>86</sup>

Having acquired several million tons of iron ore and a railroad to cart it off, Rockefeller was now stymied by a group of Lake Superior shippers who would lease him vessels only at extortionate rates. To end the deadlock, Rockefeller again recruited a talented man from the enemy ranks, Samuel Mather of Cleveland, a son-in-law of Amasa Stone. On one of those historic occasions when the curtain parted fleetingly to reveal the wizard working the levers, Rockefeller held a cordial, ten-minute, predinner chat with Mather at West Fifty-fourth Street. The visitor left with a three-million-dollar order to build twelve ore-carrying ships, steel monsters that would surpass in size anything ever floated on the Great Lakes. After shaking hands with Rockefeller, Mather never saw him again.

Given the large number of ships that he had to build, Mather figured that the shipyards would gang up and gouge him, so he pretended that he needed only one or two. After the contractors submitted their bids, they were stunned to discover that they all had contracts. The operation of this fleet required another engineering feat: the creation of specially constructed docks on Lake Superior with long railroad trestles extending hundreds of feet into the water. As the lake’s shipping cartel watched in consternation, the Rockefeller operation began to load ore at the stupefying rate of ten thousand tons every six hours. Where the schooners had charged \$4.20 a ton, Rockefeller’s operators carried their mineral cargo at a cost of 80 cents a ton.

When Mather declined to manage the fleet, Rockefeller asked Gates to suggest an experienced firm to pilot the ships. “No,” said Gates, increasingly showing flashes of a quirky independence, “I do not know of any firm to suggest at the moment, but why not run them ourselves?” Taken aback, Rockefeller replied, “You don’t know anything about ships, do you?” Gates confessed not but nominated his uncle LaMont Montgomery Bowers as a candidate. “He lives up the state, and never was on a ship in his life. He probably wouldn’t know the bow from the stern, or a sea-anchor from an umbrella, but he has good sense, he is honest, enterprising, keen, and thrifty.”<sup>87</sup> Having often hired people based on general ability, not specific skills—Gates himself being a prime example—Rockefeller acceded to the choice.

Bald and well-tailored, Bowers had an extensive business résumé, ranging from selling soap to running a real-estate agency in Omaha to selling groceries in upstate New York. Much to Rockefeller’s delight, he not only ably commanded but considerably expanded the fleet. Mostly under the aegis of the Cleveland-based Bessemer Steamship Company, Rockefeller acquired fifty-six steel vessels, the largest fleet on the Great Lakes and the world’s biggest assemblage of ore carriers. His position in lake shipping was so unassailable that he could dictate rates on Lake Superior, much as they had been dictated to him a few years earlier—a situation that galvanized Andrew Carnegie into organizing the competing Pittsburgh Steamship Company.

Tutored by Gates in the eccentric ways of Mr. Rockefeller, Bowers was told that he must not, under any circumstances, communicate with the boss. Rockefeller never saw the vast majority of ships in his armada. One day, however, Rockefeller dropped by unexpectedly to consult him on a shipping matter, prompting a humorous exchange. “You are making me break the orders I have from your own office, Mr. Rockefeller,” Bowers reminded him. “Oh, Mr. Bowers, I am getting along in years,” Rockefeller replied in his droll, midwestern manner. “I think I may really be allowed a little liberty by my office!”<sup>88</sup> Bowers’s success in managing the fleet was perhaps unfortunate, for it led directly to his later assignment to a Rockefeller-controlled mining venture in the Rocky Mountains called Colorado Fuel and Iron, where he would bring lasting disgrace to the Rockefeller name.

Rockefeller’s success on the Mesabi Range precipitated a clash between America’s two wealthiest individuals, John D. Rockefeller and Andrew Carnegie. In their approach to business, the two men had often mirrored each other, stressing attention to detail, ruthlessly slashing costs, and keeping dividends low. Both had struggled with their own unacknowledged avarice, pioneered in philanthropy, and prided themselves on being friends of the working man. Yet they never seemed to get along. Each Christmas, they perfunctorily exchanged gifts, Rockefeller giving Carnegie a paper vest, while Carnegie sent the teetotaler excellent whiskey. In letters to his colleagues, Carnegie often struck a jeering tone toward Rockefeller, refusing to concede

his business acumen, and he suffered under the misapprehension that Rockefeller had conspired with Standard Oil colleagues in the Mesabi venture. Upon first hearing of his pact with the Merritts, Carnegie lectured his steel-company board, “Remember Rockafellows [*sic*] & Porter will own the [railroad] and that’s like owning the pipe lines—Producers will not have much of a show. . . . I don’t think Standard people will succeed in making ore a monopoly like oil, they have failed in every new venture and Rockefeller’s reputation now is one of the poorest investors in the world.”<sup>89</sup>

Much too patronizing toward Rockefeller, Carnegie had seriously misjudged developments in the ore business. Having moved decisively to control coke and coal supplies, he assumed that ore would always remain cheap and plentiful and flatly told colleagues that their “brilliant and talented young partners” should stay clear of that business.<sup>90</sup> When a colorful Pittsburgh promoter, Henry Oliver, tried to interest Carnegie in a joint venture with the Merritts, he responded with a tongue-lashing: “If there is any department of business which offers no inducement, it is ore.”<sup>91</sup> Luckily, Carnegie’s subordinates overruled him and took a stake in the Mesabi ore. As a result, Carnegie Steel was not entirely excluded from the rush to secure properties in northern Minnesota.

Having failed to move aggressively, Carnegie looked on impotently as Rockefeller applied to iron ore lessons he had learned in oil, such as controlling an industry through transportation and demoralizing competitors with prices too low for them to match. Two industry trends finally compelled Carnegie to broker a deal with Rockefeller. As mergers consolidated the steel industry, it became essential to pin down sure sources of supply. And as new furnaces were equipped to use the dirt-cheap Mesabi ore, it developed into the industry standard. By 1896, the press buzzed with speculation that Rockefeller would build a huge steel mill in Cleveland or south Chicago, forge a steel trust on the Standard Oil model, and go head-to-head with Andrew Carnegie. Meanwhile, Rockefeller poured another nineteen million dollars into the Mesabi Range to buttress his railroad and shipping operations.

It vexed Carnegie that Rockefeller, an oilman, had possessed such superior foresight in the iron-ore business. In his private correspondence, he vented his frustration in petty digs, referring to him derisively as Rockafellow and later on as Wreckafellow. In December 1896, a humbled Carnegie at last consented to a sweeping deal. He promised to consume the entire output of Rockefeller’s chief mines (a minimum of 600,000 tons of ore) at the rock-bottom royalty rate of twenty-five cents a ton. In exchange for this steep discount, however, Carnegie agreed to ship the entire amount plus another 600,000 tons from his own mines over Rockefeller’s railroads and on his vessels. It was the same kind of back-scratching arrangement that Rockefeller had negotiated with the railroads to monopolize the oil industry. To complete their truce, Carnegie pledged to refrain from buying new Mesabi fields or transporting iron ore, while Rockefeller renounced any ambition to construct a steel mill. A generation later, Carnegie still boasted of this deal before a Senate committee. “Don’t you know, it does my heart good to think I got ahead of John D. Rockefeller on a bargain.”<sup>92</sup> In fact, the bargain had been Carnegie’s belated attempt to redress his own error.

Small competitors found it impossible to survive the union of the largest producer and largest consumer of iron ore, and Carnegie and Rockefeller profited smartly. As with oil, ore prices skidded lower, bankrupting marginal producers and bolstering the Rockefeller-Carnegie alliance. As the decade closed, ferocious competition broke out for the remaining Mesabi properties. The price of Lake Superior Consolidated stock that Rockefeller had bought for \$10 in 1894 levitated to \$60 in 1899, \$70 in 1900, then a staggering \$100 in 1901.

America now stood on the threshold of an era of economic consolidation that saw trusts spread to many industries. What Rockefeller had accomplished in oil a generation earlier was now being imitated in steel, copper, rubber, tobacco, leather, and other products—much to the alarm of many voters. The ideological lines were drawn sharply in the 1896 presidential election. The Democratic candidate, William Jennings Bryan, an eloquent orator adored by socialists, populists, and silverites, vied with former Ohio governor William McKinley, a staunch advocate of tariffs, trusts, and hard currency. Apprehensive about a Bryan presidency, businessmen transformed the McKinley campaign into a crusade against trustbusting infidels. Standard Oil supplied \$250,000 to McKinley’s coffers—equal to half of the total Democratic contributions—and Rockefeller sent another \$2,500 to campaign manager Mark Hanna. For a man normally scornful of politicians, Rockefeller displayed unusual passion for McKinley, asserting, “I can see nothing else for us to do, to serve the Country and our honor.”<sup>93</sup>

The business community reacted to the McKinley victory as if America had been blessedly spared a revolution, a mood summed up in Hanna’s congratulatory telegram to McKinley: “God’s in his heaven—all’s right with the world.”<sup>94</sup> During the next few years, a new faith arose in business circles about the inevitability and unrivaled efficiency of monopolies. Mark Hanna, now tagged “Dollar Mark” by the press, proclaimed loudly that the Sherman Antitrust Act would never be allowed to thwart this trend in a Republican administration.

Stimulated by the Spanish-American War, the Klondike gold strike, and McKinley’s reassuring presence, the American economy surged ahead in the late 1890s, propelling the United States past all other nations in industrial capacity. In a country that still liked to picture itself as composed of small businesses, huge companies now blanketed markets from coast to coast. As satirist Finley Peter Dunne observed in 1897, “I have seen America spread out from th’ Atlantic to th’ Pacific, with a branch office iv th’ Standard Ile Comp’ny in ivry hamlet.”<sup>95</sup> Between 1898 and 1902, 198 trusts or giant new corporations were created in coal, sugar, and other industries, prompting a growing backlash. At a Chicago antitrust conference in 1898, William Jennings Bryan drew roars from the faithful when he shouted, “One of the great purposes of government is to put rings in the noses of hogs!”<sup>96</sup> The McKinley administration, true to its promises, stood guard over the new corporate giants.

The merger wave conferred a new centrality on Wall Street investment houses, for the capital needs of the new trusts dwarfed the resources of small-town banks and private individuals. Only the prestigious Wall Street firms such as J. P. Morgan and Company or Kuhn, Loeb could tap the foreign and domestic capital needed to execute these transactions. Switching their focus from railroad bonds to industrial securities, they forged the new trusts, issued their stock, tucked away shares for themselves, and handpicked their executives. However much reformers deplored the trusts, they excited many investors, who absorbed wave after wave of new issues sponsored by Wall Street. While many Americans quaked before these giant new concerns, many others were trying to figure out how to profit from them.

When J. P. Morgan decided to create a steel trust in late 1900, he knew he would have to tangle with two men who were confirmed cynics about Wall Street: Carnegie, master of the steel mills, and Rockefeller, king of the iron ore. Morgan was worried that Carnegie would diversify into finished steel

products and threaten his recently launched Federal Steel Company, while Carnegie feared a reverse maneuver by Morgan. Meanwhile, Carnegie and Morgan were both alarmed by reports that Rockefeller might diversify into steel mills. To avert overbuilding and internecine price wars, Morgan decided to spearhead a new steel consolidation.

Morgan was not thrilled about catering to Rockefeller, who had flouted Wall Street by financing his trust from retained earnings and holding cash reserves equal to those of many banks. He was also well aware of William Rockefeller's intimacy with James Stillman of National City Bank. When Morgan contemplated a merger with the London house of Barings in 1904, his counterpart, Lord Revelstoke, reported afterward to a partner that Morgan "inveighed bitterly against the growing power of the Jews and of the Rockefeller crowd, and said more than once that our firm and his were the only two composed of white men in New York."<sup>97</sup>

In many respects, Rockefeller and Morgan were antithetical types, offering a vivid contrast between the ascetic and the sybarite, the Roundhead and the Cavalier. As the chieftain of the Anglo-American financial establishment, the wellborn Morgan, expensively educated in America and Europe, was a consummate insider in the business world. For more than forty years, he had been the chief conduit for British capital that had financed American railroads and industry. Blustery and theatrical, Morgan was impetuous and hot-blooded, cursed with a short attention span. At his headquarters at 23 Wall Street, he often seemed harried, ruling by brilliant snap judgments. Fond of luxury, Morgan inhabited the world of the ultrarich, with their gargantuan cigars, fine port, and oversized steam yachts.

For Rockefeller, Morgan embodied all the sins of pride, luxury, and arrogance. When they first met at William Rockefeller's Hudson River mansion, they took an instant dislike to each other. "We had a few pleasant words," noted Rockefeller. "But I could see that Mr. Morgan was very much—well, like Mr. Morgan; very haughty, very inclined to look down on other men. I looked at him. For my part, I have never been able to see why any man should have such a high and mighty feeling about himself."<sup>98</sup> For Morgan, Rockefeller was too dry and prudish, devoid of manly charms and vices. And how could he not grumble at the effrontery of someone who had created a cartel without him?

Nevertheless, both men detested competition as a destructive force, a dangerously antiquated notion. For years, Morgan had arbitrated disputes among railroad presidents, helping them to carve up territories, and his formation of industrial trusts constituted a logical progression in his career. When Judge Elbert H. Gary informed Morgan in early 1901 that Rockefeller's Mesabi interests had to form part of any steel cartel, Morgan balked. "We have got all we can attend to," he told Gary. When Gary persisted, Morgan glumly agreed that they had to incorporate Lake Superior Consolidated Iron Mines and Bessemer Steamship into U.S. Steel.

"How are we going to get them?" he asked.

"You are going to talk to Mr. Rockefeller," said Gary.

"I would not think of it," said Morgan.

"Why?"

"I don't like him."

"Mr. Morgan," Gary retorted, "when a business proposition of so great importance to the Steel Corporation is involved, would you let a personal prejudice interfere with your success?"

"I don't know," said Morgan.<sup>99</sup>

In all likelihood, Morgan's attitude was a mixture of haughtiness and cowardice, for Rockefeller was one of the few people he could not intimidate. In an act of considerable self-mortification, Morgan asked Rockefeller if he could see him at 26 Broadway. Explaining that he was retired and never went to the office, Rockefeller said he would be happy to receive him at West Fifty-fourth Street. Rockefeller knew the bargaining edge of the last-minute holdout and enjoyed tweaking Wall Street's foremost banker. Soon after he arrived at Rockefeller's house, Morgan gruffly asked the price of the ore properties. Rockefeller threw up his hands in mock despair, reminded Morgan that he was retired, and told him to discuss the deal with his twenty-seven-year-old son, "who would undoubtedly be glad" to talk with him.<sup>100</sup> This was a blatant affront, but the banker grudgingly said that Junior should call at his office at Broad and Wall Streets.

Relishing their little game, Senior and Junior stalled in arranging the meeting and very nearly overplayed their hand. Then, on the morning of February 25, 1901, Henry Rogers stopped by Junior's desk and inquired, "Would you like to go with me to meet Mr. Morgan?"<sup>101</sup> Sensing that the time had come to put Morgan out of his misery, Junior accompanied Rogers that afternoon. Now it was Morgan's turn to behave in a condescending manner. When Rogers and Junior entered his office, he was consulting with his partner Charles Steele and did not look up from his desk. When Steele left, Morgan finally lifted his eyes, and Rogers introduced Junior. Morgan complained about the delay and said matters had to be wrapped up within twenty-four hours. Junior explained that it had taken time to appraise the properties. "Well," Morgan barked, glowering at Junior, "what's your price?"

If Morgan thought he was dealing with a choirboy, he was soon undeceived. Showing an unexpected pluck that nobody, not even Junior, knew was there, he shot back, "Mr. Morgan, I think there must be some mistake. I did not come here to sell. I understood you wished to buy."<sup>102</sup> He asked Morgan to name a price that his father might accept or decline. For Junior, it must have been a revelatory moment: He was sparring with Wall Street's potentate. When Morgan stepped out briefly, Henry Rogers, flabbergasted, advised Junior to soften his tone, but Junior said he meant every word and that he and father were "absolutely indifferent about coming into the consolidation."<sup>103</sup> The tense standoff ended in a compromise: Morgan and Junior agreed that Henry Clay Frick would serve as an honest broker to establish a mutually agreeable price. As Junior was leaving, he asked Morgan whether his father might take a share in the steel syndication. Taking another jab, Morgan replied that the offering was oversubscribed and that he had delayed too long in submitting his request. Since Morgan had already set aside five-million-dollar allotments for William Rockefeller and James Stillman, he must have

known that John D. would be stung by this exclusion.

When Junior returned to 26 Broadway, he immediately wrote to his parents, describing Morgan's brusqueness and his response. "The whole thing suggested the final sweep-up of the room and we seemed to be the crumbs around the edge which of course must be swept up and expect to be swept up and which it was most annoying to find at this late date still on the floor."<sup>104</sup> His parents were overjoyed that Junior had stood up to Morgan. His father, reading the letter aloud to Cettie, paused every few sentences to exclaim, "Great Caesar, but John is a trump!" Cettie—every inch the Spartan mother—was no less amazed. "Indeed you were masterly in the conduct of the negotiation," she wrote back, "and you are so quiet and unassuming in both words and manner. Control of self wins the battle, for it means control of others."<sup>105</sup> The ecstatic response of Junior's parents perhaps hints at relief from unspoken doubts, as if they both had wondered whether he could meet the demands imposed by the family fortune.

After the meeting, Morgan urged Frick to visit Rockefeller at his Pocantico estate. To avoid publicity, Frick took a carriage up after dark, and the coachman waited at the front gate while Frick and Rockefeller huddled behind some shrubbery. "Wouldn't it have made quite a story for the newspapers—our skulking around in the bushes in the dark?" Rockefeller later mused.<sup>106</sup> As usual, he was wary and distant, not tipping his hand. "As my son told Mr. Morgan, I am not anxious to sell my own properties. But as you surmise, I never wish to stand in the way of a worthy enterprise. I do frankly object, however, to a prospective purchaser arbitrarily fixing an 'outside figure,' and I cannot deal on such a basis."<sup>107</sup> When Frick finally told him that Judge Gary's figure for Rockefeller's ore properties was five million dollars below its true value, Rockefeller said curtly, "Then, I will trust you to represent me."<sup>108</sup> With his usual minimalist art, Rockefeller had concluded this epochal meeting in about fifteen minutes. On February 28, when Gates and Junior sat down with Frick at 26 Broadway, they maintained the party line that Rockefeller was not eager to sell. Just two weeks later, Rockefeller's papers show a startling development that altered the course of the negotiations. Gates had commissioned new maps of potential ore deposits along the Mesabi Range that disclosed for the first time the likely existence of undiscovered mines. As Junior interpreted this catastrophic news to his father, "We had supposed up to date that we now controlled practically all of the ore reserve of the range. In view of this new map, the information of which is known only to ourselves, we are more inclined to make some trade."<sup>109</sup> After this, the Rockefellers subtly softened their negotiating posture, aided by a rapport between Junior and Frick so strong that Junior was later made an executor of Frick's estate. "I have met no one in business whom I have been more strongly drawn to and have greater confidence in than Mr. Frick," Junior told his father in mid-March.<sup>110</sup> The talks were also assisted by Rockefeller's declared resolve not to extract the last penny so as "to leave a favorable and friendly impression on Mr. Morgan," as Junior put it.<sup>111</sup>

For all that, Rockefeller reaped a fantastic profit in the creation of U.S. Steel, the first billion-dollar corporation and the first trust to overtake Standard Oil in size. The Consolidated stock originally bought for \$10 a share in 1893 now fetched the equivalent of \$160 in cash in 1901. Gates and Junior made an agreement with Frick that the Rockefellers would receive \$80 million for the Consolidated stock—half in the form of U.S. Steel common stock and half in preferred—and another \$8.5 million for the fifty-six lake vessels of the Bessemer fleet. Gates estimated that \$55 million of the \$88.5 million was clear profit. The U.S. Steel deal swelled Rockefeller's net worth beyond \$200 million (\$3.5 billion today) and made him the second-richest man in America. On the other hand, he fell further behind Andrew Carnegie, who had received \$300 million in bonds as his portion for the sale of Carnegie Steel. But this moment marked the zenith of Carnegie's wealth, whereas Rockefeller was just warming up.

Having overseen the Mesabi operation, Gates was not shy about demanding his due. When he delivered an oral report on the \$55 million profit, Rockefeller saluted his effort and murmured quietly, "Thank you, Mr. Gates—thank you!" Gates fixed Rockefeller with a steady, quizzical look. For a long time, he had shown an almost filial deference toward his boss, but he was now well aware of his worth. Seizing the moment, he had the courage to say, "'Thank you' is not enough, Mr. Rockefeller." Forced to reconsider, Rockefeller evidently came up with a large enough bonus, although Gates never revealed the exact amount.<sup>112</sup> Notwithstanding his veneration of his mentor, Gates griped for years about his compensation and sometimes stooped to nasty jokes about Rockefeller's avarice.

For a time, it seemed the steel trust might effect a rapprochement between Rockefeller and J. P. Morgan. As one of the largest U.S. Steel stockholders, Rockefeller demanded and won board seats for himself and his son. Yet financial differences quickly soured his relations with Morgan. Rockefeller was upset by U.S. Steel's extravagant dividends, even though he was a major recipient. In 1904, to register his protest, he resigned from the board, never having attended a meeting, and left Junior behind to represent him. By 1911, the Rockefellers liquidated the last of their U.S. Steel holdings. During the next two years, Morgan enjoyed an unspoken revenge by continuing to assign Rockefeller inferior positions in the weaker bond syndicates while excluding him from the sounder issues. Gates was always mystified by Morgan's success. "He seems to be a man incapable of calm and reasoning reflection; the victim of a succession of unreasoning impulses."<sup>113</sup>

Before leaving Rockefeller's exploits in the realm of iron ore, we should mark a prominent casualty of this adventure: his already troubled relationship with brother Frank. During the 1890s, Frank remained a vice president of Standard Oil of Ohio and took home a generous salary, despite his extended absences from Cleveland and a scornful indifference to business. As irascible as ever, he wrote testy letters to Standard Oil colleagues, forcing John and William to mediate. Frank was devoured by bitterness and often lapsed into violent, ungovernable rages that were aggravated by his alcoholism.

Frank could never curb his compulsive gambling. Wanting to emulate the big killings of his brothers, he was tempted again and again into foolhardy ventures. With the best intentions, John fed Frank's gambling addiction, even though Frank often did not realize the source of the loans. John and William continued to carry a \$180,000 mortgage on his Kansas ranch and bailed him out when his crops failed in 1893. This generosity only highlighted Frank's chronic dependency and further embittered him. In extending loans to Frank, John followed his usual strict accounting rules, which he always applied in a compulsive, inflexible fashion. Nevertheless, when it suited his convenience, Frank was offended by his brother's refusal to compromise on his business principles.

Frank's best friend at the time was a bluff Irishman named James Corrigan. They hunted together, maintained adjoining estates in Ohio, and often invested together. A handsome man with a heavy jaw and bull neck, Corrigan was a popular, pugnacious Cleveland businessman. In the early 1880s, he had sold several refineries to John D., who had given him his first job and counted him as a friend. As payment for one refinery, Rockefeller gave Corrigan 2,500 shares of Standard Oil. With this money, Corrigan bought a half interest in the Franklin Iron Mining Company in the Lake Superior region

of Wisconsin—the investment that first piqued Rockefeller’s interest in the Mesabi Range. John loaned Frank the money to purchase the other half, keeping the mining stock as collateral. Not without reason, John D. later ruefully stated, “Neither my brother nor Corrigan had any reason to complain of my conduct. I made James Corrigan his fortune. I made my brother his fortune.”<sup>114</sup>
